Managing Natural Resources

In place of the present incredibly fragmented bureaucratic system, it is necessary to institute two basic regimes of environmental management: a supply regime for fulfilling the natural resource demands of the local people as well as the larger economy and a safety regime focusing on provision of ecosystem services and conservation of biological diversity. It is also necessary to create a system of positive incentives to ensure maintenance of high levels of biodiversity in the supply regime, especially through protection of smaller safety zones and provision for basic needs of people in the larger safety sites. An alternative programme of action formulated as a People's Natural Resource Management Bill. **2501**

Castles in the Air

The Maharashtra government has formulated a scheme for housing slum-dwellers in Bombay under which 'pucca' buildings are to be built for them by builders anxious to make profits out of the free-sale component that is offered as an incentive. A careful examination of the scheme makes it clear, however, that implementing it is not a matter of serious concern for the government. A few free lunches there may well be, but nowhere near 40 lakhs. **2473**

The Afzalpurkar report on housing Bombay's 40 lakh slum-dwellers fails to take its implications to their logical conclusion. With procedures of transit accommodation not clearly worked out and no commitment on the part of the state towards infrastructural development, the scheme has generated a lukewarm response among builders and may face opposition from the slum-dwellers themselves. **2477**

UN and Globalisation

The new framework of global 'integration' poses a threat not only to the integrity of nations and cultures, but also to the state system as it has evolved over the centuries and seeks to displace the United Nations as a basis for providing unity and order. Along with the nation-state, the UN too is losing its autonomy and its role in world affairs, both in the maintenance of peace and security and in the broader areas of development, culture, human rights and the defence of basic values. **2513**

Resource Poverty and the Poor

The debate over where scarce R and D resources should be allocated — to the more poorly or better endowed regions — is often clouded by largely unsubstantiated views about where the bulk of the poor are located. The widely-held view that a disproportionate number of the poor are to be found in the more marginal environments is not supported by evidence. **2494**

Informal Censorship

In the smaller towns and areas outside the metropolises, books, journals and pamphlets are being subjected to informal censorship by the authorities. **2472**

Centre-State Fiscal Transfers

In contrast to its dynamic interaction with the states in the field of tax reform in the area of inter-governmental fiscal transfers the centre has been diffident and pessimistic. Against this background the recommendations of the Tenth Finance Commission in its Alternative Scheme of devolution are appropriate and timely. **2518**

Cuba: The Renewal

While Cuba repudiates *laissez-faire* as the way to national reconstruction, in what is now officially celebrated as 'the special period' there is a radical break from the inflexibility of an earlier brand of socialism by vastly extending the scope of the market that functions within the framework of a comprehensive national plan. And the sweeping internal changes which are transforming Cuba are taking place at a time when, US machinations notwithstanding, the country's long isolation is clearly coming to an end. **2487**

Politics as Property

The social urge represented by the toppling of N T Rama Rao in Andhra Pradesh demands economic and industrial modernisation and, for that, efficient and quick-acting governance of the type that has made men like Pratap Singh Kairon and Sharad Pawar famous. It is here that NTR is perceived by a substantial segment of the state's elite as having failed. **2482**

LETTERS TO EDITOR

Crop Growth in West Bengal

APROPOS of the debate on agricultural growth in West Bengal (March 26, 1994 and subsequent issues of July 16, July 30, October 22 and November 19 of the last year), Madhura Swaminathan, one of the authors of that scholarly study, has since revealed (*Frontline*, March 24, 1995) some new facts which may be of interest to *EPW* readers. These are, in her words:

The data series from the BAES is not available to independent researchers (and the government of West Bengal has noted that the BAES estimates of production are lower than those of DOA). It is also of note that the government of West Bengal has decided to return the task of preparing the sample frame to the BAES from the Land Revenue Departments. [DOA stands for Department of Agriculture]

The above clearly vindicates two of my points relating to the quality of crop-data of West Bengal. Swaminathan did not however mention the source of her above pieces of information. One may however reasonably guess that the source was a sheet of unsigned paper (may we term it, borrowing from diplomatic lexicon, a non-paper?) informally circulated by a GOWB spokesman during a seminar on 'Agricultural Growth and Agrarian Structure in Contemporary West Bengal and Bangladesh' held in January this year at Calcutta. Though I was not a participant, James K Boyce kindly showed me a copy of that non-paper at a meeting with him arranged by A Saha (co-author of the *EPW* article of March 26, 1994). At that meeting Swaminathan was also present. In that non-paper GOWB admitted that the total production of foodgrains would be less than the official figure during the years 1979-80 to 1985-86 (excepting 1981-82) if the estimates of yield figures furnished by BAES were accepted by DOA. Secondly, while announcing that BAES was now entrusted, in partial modification of the procedure laying down the sole involvement of amins of the Land Revenue Department as practised since 1986-87, with the task of preparation of sampling frames of crop cutting experiments, GOWB reported through the same non-paper that the proportion of experiments performed by BAES for aus crop (early Kharif rice) in the originally intended sample plots increased from an inadequate 59 per cent in 1993-94 to 80 per cent in 1994-95. It was also expected by GOWB that during the aman season of 1994-95 this percentage would rise to about 90. GOWB was however totally silent about DOA's percentages. *EPW* readers may now themselves form a fair idea of the depth of the iceberg hidden under-water. In the pre-1986-87 era it was all open, which state of affairs helped Boyce build up his revised series of crop data for the 1960s and 1970s.

Regarding the post-1985-86 period, even if the BAES production series are available, I would like to record this note of caution for researchers: that the figures are unlikely to reflect reality because of the sample of crop cutting experiments being affected by large-scale substitution as admitted by the government.

Now a few words from my side. The first is the related point of upwardly biased estimation of yield from crop cutting samples stained by large-scale substitution. Here the crop wheat is discussed. In the report of the Agriculture Census 1985-86 of West Bengal (which was published in 1993 and came to my notice much later) it is given that 25.55 per cent of WB's wheat crop area in the year was unirrigated. DOA however reported in WB's *Economic Review* that 100 per cent wheat area came under HYV. If both the figures reflect realities, it would imply that HYV wheat could be sown on unirrigated plots as well. It may reasonably be presumed that such crops would be harvested earlier and their yield would be less than that of irrigated HYV. In such a situation there was every likelihood of unirrigated low-yielding wheat crop being missed during crop cutting experiments and substituted by the late ripening irrigated crop giving higher yields. In that case, wheat yield as estimated from samples composed of a substantial number of substitute experiments on late crops would be upwardly biased. I regret I did not envisage such a situation for wheat earlier.

As an example of 'agency-bras' (engineered by departmental motivation) in my last note (*EPW*, November 19, 1994) the official figure of 6.5 lakh tonnes of meat production for 1987-88 was shown to far exceed the credibility limit. For the interested readers I would like to state that it has

now been scaled down to 4 lakh tonnes for 1993-94 in the WB's *Economic Review*, 1994-95. Who should be (dis)credited for such a sharp decline in the state's meat production (statistics)? Anyway, it is good that the bloated belly has burst in six years' time. Incidentally, would someone in GOWB tell us about the basis of such grotesque (food) figures of West Bengal?

Peace in Punjab

HERE today, gone tomorrow.
All his minions have wept in sorrow.
Beant Singh, got the fatal sting-
Despite that strong security ring.
Oh! Death, you can be justly proud,
Of victims, Punjab gives you a crowd.
Punjabis love war all the time,
At all places, in every clime
Our hearts were big, now, our Egos are taller,
Here, none is equal, everybody else is smaller.
Lalas are the butt of jokes among Martial Races;
At poor Harijans, Agriculturist Tribes make faces.
Young men dance to our martial tradition,
And forces chop them off for the Nation.
Akalis quarrel for a Sikh Nest,
Congress fights only to look the best.
BJP squirms as here it does not count,
Commies send sermons from their Red Mount.
Green Revolution has blood flowing-
Coffers are full, yet, misery is growing.
Injury incites anger, our preachers say.
In such a land, can Peace ever stay?

The Rogue Sector

DIVERSIFICATION of the financial system has received a tremendous impetus in the post-liberalisation period. The growth of non-banking financial companies (NBFCs) and of the deposit-accepting activities of non-financial (essentially manufacturing, trading and processing) companies has been especially spectacular. After the report of the Joint Parliamentary Committee (JPC) on irregularities in securities and banking transactions, the authorities have also taken brisk action to regulate the activities of NBFCs. So the situation is one of a tug-of-war between the regulatory authorities, the Reserve Bank of India specifically, and the NBFCs. The JPC was very categorical that the NBFCs had "played a dubious role in the scam". It drew attention to how over a period of years an entirely new sector of financial activity was allowed to grow and flourish without any thought being given to the deleterious consequences of such activity and without recognising the limitations of the RBI Act in dealing with these consequences. Subsidiaries of public sector banks showed considerable ingenuity in these dubious games.

The series of measures taken by the RBI, particularly after the submission of the A C Shah working group report on financial companies which was itself a sequel to the JPC report, have nevertheless been quite substantial. Earlier, only the deposit-acceptance activities of NBFCs were being regulated under Chapter III B of the Reserve Bank of India Act, specially introduced in 1984. As for informal credit agencies, in 1982 a legislation to regulate conventional chits, namely, the Chit Funds Act, 1982, was passed, which the various states have adopted. Earlier, an act of parliament had banned the conduct of prize chits, savings schemes and money circulation schemes; these benefited primarily their promoters and did not serve any social purpose and hence they were banned on the recommendation of the James Raj committee (1974). The banking laws amendment of 1984 also introduced a new Chapter III C in the RBI Act titled as 'Prohibition of Acceptance of Deposits by Unincorporated Enterprises'. In terms of its provisions, the number of depositors from whom deposits could be accepted was placed at 25 in respect of individuals and at 25 depositors per partner, subject to a ceiling of 250 depositors per firm/association. The restriction was on the number of depositors and not on the amount of deposits so as to protect small and unwary depositors. Both the regulations on chit funds and on deposit acceptance by unincorporated enterprises were challenged before the Supreme Court but the court upheld them as reasonable and constitutionally valid. The enforcement of these two laws is supervised by the state governments and

there have been reports of slackness on the part of the latter with demands that some of the powers be vested with the RBI.

The RBI governor and government spokespersons have spoken recently of amendment of the RBI Act towards this end. More significantly, additional powers need to be conferred on the RBI so that not only deposit-acceptance but also the assets side of the NBFCs' balance sheets are brought under the RBI's overall regulation and supervision.

Even before the enactment of new legislation, the RBI has introduced a series of regulations to ensure a degree of financial discipline among NBFCs. Apart from the stipulations regarding the duration of deposits, maximum rates of interest (14 per cent at present) and maintenance of minimum liquid assets (restored to 15 per cent of deposits), the RBI has issued detailed guidelines prescribing prudential norms, similar to those for commercial banks, for NBFCs and residuary non-banking financial companies covering income recognition, accounting standards, capital adequacy (8 per cent risk-weighted) and concentration of credit and investments (generally not more than 15 per cent of net owned funds to a single party or 25 per cent to a group). A major recommendation of the A C Shah committee, which has been accepted, relates to the requirement for all financial companies including residuary companies, with net owned funds (NOFs) of Rs 50 lakh and over to register themselves with the Reserve Bank. The working group also suggested that such companies should get themselves rated for their fixed deposits by one of the three recognised credit rating agencies. In return and as a liberalisation measure, NBFCs registered with the RBI would be allowed higher limits on acceptance of deposits equal to 100 per cent of their NOFs against the then existing limit of 25 per cent and 15 per cent of NOFs from the public and from shareholders, respectively. Companies not registered with the RBI or failing to get the minimum credit rating would have to bring down their deposits (including inter-corporate deposits and borrowings) to the 25 per cent and 15 per cent levels.

More noteworthy is the restriction placed on lending by commercial banks and financial institutions to NBFCs. In September 1994 the limit for bank borrowings for equipment leasing and hire-purchase companies not having 75 per cent or more of their assets or 75 per cent or more of gross income from these two activities was reduced from four times their NOF to three times; the other major equipment leasing and higher-purchases companies continued to enjoy the four times limit. For investment and loan companies, the limit was reduced from three to two times the NOF. In April this year all these limits were further reduced by one multiple each of

the NOF. In September 1994 commercial banks/financial institutions were prohibited from granting bridge loans or interim finance to NBFCs against capital/debenture issues. In April this year the ban was extended to all companies (including finance companies). The restrictions on banks' and other institutional lending to finance companies is a circuitous way of regulating the latter's lending activities. At present there are no legal provisions for regulating the assets side of their balance sheets. Hence the case for enactment of the draft bill prepared by the RBI on the recommendations of the A C Shah working group.

The monetary authorities' anxiety over the rapid growth of NBFCs is understandable. The aggregate deposits (including bank borrowings) of just 12,350 non-banking (financial and non-financial) companies shot up from Rs 1,50,227 crore at the end of March 1993 to Rs 2,10,979 crore at end-March 1994, a rise of Rs 60,752 crore or 40.4 per cent. In that year non-food bank credit had expanded by only Rs 37,797 crore. Aggregate deposits of just the financial companies rose from Rs 43,447 crore to Rs 58,702 crore, a rise of Rs 15,255 crore or 35 per cent. At a recent meeting with the Confederation of Indian Industries (CII), the RBI governor revealed that, despite the various restraints, credit limits sanctioned by banks to leasing and hire-purchase companies had gone up by Rs 915 crore during April 1 to September 2, 1995 against a rise of Rs 391 crore in the corresponding period of last year.

Some of the major aspects of the growth of the NBFCs have been brought out by a recent study by the ICICI on the financial performance of 150 non-banking financial companies in the private sector. Total assets of these companies went up from Rs 18,301 crore at the end of 1991-92 to Rs 28,808 crore at the end of 1993-94, a compound growth of 25.5 per cent per annum. Apart from investments made in fixed assets, the NBFCs' clout in the financial market is evident from the increase in their cash and bank balances from Rs 752 crore to Rs 1,551 crore (106 per cent), in their investments from Rs 1,142 crore to Rs 2,175 crore (90 per cent) and in trade bills purchased from Rs 608 crore to Rs 1,992 crore (216 per cent). By comparison, their loans and advances have risen by only 36 per cent from Rs 5,684 crore to Rs 7,675 crore in two years. On the liabilities side, the largest increase has occurred under the head 'unsecured loans and deposits' from Rs 4,999 crore to Rs 8,640 crore, a rise of 72.8 per cent in two years. Borrowings from banks for working capital rose by 43 per cent, from Rs 808 crore to Rs 1,156 crore; in addition, long-term borrowings from banks and financial institutions rose by 38 per cent from Rs 2,329 crore to Rs 3,210 crore. The profitability of the sample finance

companies studied by the ICICI also stands out. Gross profits galloped from Rs 997 crore in 1991-92 to Rs 2,077 crore in 1993-94 (by 108 per cent), profits before tax from Rs 520 crore to Rs 1,223 crore (135 per cent) and profits after tax from Rs 412 crore to Rs 1,061 crore (157 per cent). Significantly, tax provision as percentage of profits before tax declined from 20.2 per cent in 1991-92 to 15.2 per cent in 1992-93 and to 13.3 per cent in 1993-94. The present tax laws permit what the ICICI study calls 'good tax planning' by claiming high depreciation on leased assets. If a minimum taxation of even 25 per cent were imposed on these companies, the exchequer would have earned Rs 306 crore against the Rs 162.50 crore actually provided by the 150 finance companies. Unless the deployment of funds by the finance companies is regulated, their clout over the economic system, particularly through playing the equity and bonds markets and the real estate market, may assume dangerous proportions. For this the inadequacy of the powers vested with the RBI and of the monitoring arrangements will be to blame.

POLITICS

Cracks in BJP

THE cracks in the BJP in Gujarat, Uttar Pradesh, Madhya Pradesh and Delhi are a slap in the face of the party's arrogant claim of offering stable governments to its voters and an image of a disciplined party capable of delivering the goods. The Gujarat developments in particular reveal that its leaders and legislators are as bad as other politicians when it comes to matters like squabbling over the spoils of office. Notwithstanding the strenuous efforts by the RSS brains trust to bind together the different affiliates of the 'Sangh parivar' into a monolithic family around a spurious ideology called 'Hindutva', at the ground level the lure of the more attractive booty available from the present political system appears to prevail over whatever ideological commitments the BJP legislators might have.

The BJP leaders are trapped on the one hand by their pretentious self-projection as the rulers of India from next year onwards, and on the other by their attempts to be over-smart in using militant 'Hindutva' to gain popularity. Given the credentials of the BJP legislators in many states – a large number of them found to be a part of the underworld, just like their counterparts in the other political parties – it is becoming difficult for the BJP national leadership to live up to the image of a clean party that it had been trying to build up all these years. While the open revolt by Shankersinh Waghela in Gujarat and the acrimonious exchanges in public between the two factions of the party there are the extreme

manifestation of the rot that has set in in the organisation, rumblings within the BJP ranks and state leaders in Uttar Pradesh, Madhya Pradesh and Delhi are premonitions of a Gujarat-type humiliation that is in store for the Advanis and Murli Manohar Joshis who had been patting each other on the back in a self-indulgent fantasy of ruling India.

In their ambition to capture power, the BJP leaders were bound to open their doors to all sorts of characters – political careerists, criminals, mercenaries, brokers who could ensure them votes, either through muscle-power or economic manipulation. Even their own trusted leaders in the states, those trained in the rigorous RSS norms, have apparently fallen for the lure of the lucre, as evident from the charges of corruption against BJP ministers and MLAs. Like many other political parties which started from a firm commitment to moral principles and were later dragged down into the mire of corruption and criminality by the compulsions embedded in the Indian political system, the BJP also is going through the same process. We are thus entertained with the amusing spectacle of its leaders defending their decision to lend support to the BSP in a bid to overthrow Mulayam Singh Yadav's government in UP, and getting peeved when the Congress Party adopts the same tactics in Gujarat to oust the BJP government there by supporting the BJP rebels.

In order to propagate militant 'Hindutva', the BJP depended on muscle power and outfits like the Bajrang Dal attracted goons from all over the country. These elements which were used against Muslims and secular forces soon after the demolition of the Babri masjid are now being employed by one faction against another within the BJP. In Delhi some time ago organisational elections in the party's Mehrauli district unit had to be put off because of pitched battles between followers of two rival candidates. In Maharashtra, the BJP is realising to its chagrin that when it comes to muscle power, the Shiv Sena can go one better. Fears of reprisal restrain the BJP leaders and workers from publicly protesting against the humiliation that they suffer at the hands of the Sena. But such abject surrender is creating rumblings of muffled protest against the leadership among the ranks, as in UP again where stalwarts like Kalyan Singh are being snubbed almost every day by Mayawati and Kanshi Ram, while the national leaders remain silent spectators to the duo's campaign of ridicule against Ram – the darling of BJP's ideology of 'Hindutva'. The simmering discontent among the ranks in UP exploded recently during elections to the city and district units of the party in the state when, as in Delhi, violent clashes broke out between supporters of rival factions.

One can, however, discover a silver lining in the crisis of the BJP. If nothing else, at

least the great leveller in the Indian political system – the trinity of corruption, criminalisation and internecine feuds – has finally caught up with the BJP. That is the only hope for the decimation of what threatens to be a malignant tumour in Indian society.

MAHARASHTRA

Divide and Rule

THE BJP-Shiv Sena government has announced that it would withdraw the 1,100 cases, filed under the Prevention of Atrocities Act, in connection with the agitation for renaming the Marathawada University. By shrewdly segregating the issue of renaming from others on which cases have been filed under the anti-atrocities act in the state the government has targeted the neo-Buddhist segment amongst the dalits. With the elections round the corner, this move aims to keep Marathawada polarised.

The neo-Buddhists, who were in the forefront of the movement for renaming the Marathawada University as Dr Babasaheb Ambedkar University, were selectively hunted, their hutments burnt, and rendered homeless in the violence the dominant castes unleashed in Marathawada in 1978. The issue remained unresolved for several years. With the enactment of the anti-atrocities act in 1989 there was a sudden increase in the number of cases filed by the dalits. But it is wrong to presume that this increase is solely because the dalits, especially the neo-Buddhists, decided to take revenge on the 'savarnas', an impression which the BJP-SS government is avidly circulating.

In fact, throughout the 1980s, Marathawada witnessed several agitations demanding the regularisation of encroached lands in the names of dalits. The land ownership pattern in Marathawada is highly skewed with a sizeable number of landlords owning land between 50-1,000 acres and an ever increasing number of dalits joining the ranks of landless labourers. When the dalits encroached on government fallow pasture lands on the outskirts of the villages and started to till them, there was severe shortage of agricultural labourers for the landed castes, and as a consequence, agricultural wages shot up. Many clashes occurred between the dominant castes and the dalits. The dalits were boycotted, denied groceries and agricultural implements, cattle were let loose on their standing crops and the crops destroyed. Many gram panchayats, dominated by landed castes, passed resolutions transferring the pasture lands to social forestry departments. In 1978 the Maharashtra government, then under the chief ministership of Sharad Pawar and the Progressive Democratic Front, passed a resolution regularising encroached lands till March 31, 1978. But the follow-up suffered neglect – encroached lands were

not clearly delimited nor were appropriate maps issued. The dalits, bereft of vital documents, especially caste certificate, were unable to claim their rights. Hence, even though a similar resolution was passed by the Sudhakarrao Naik government in 1991, the birth centenary year of Babasaheb Ambedkar, matters seemed to have hardly improved. In 1994, the 4,132 cases filed under the anti-atrocities act, most were of rape, murder, arson, etc, due to the animosity over the land issue, remained pending in the courts of Maharashtra. As did the 1,753 cases filed under the Protection of Civil Rights Act, 1955, remained pending. Maharashtra is one of the many states which has not instituted special courts under the anti-atrocities act to expedite cases. Till now, out of 3,606 cases filed in Marathawada under the anti-atrocities act, only in 17 per cent has the accused been convicted. Between 1976 and 1993 the accused have been released in 603 out of 907 cases in the Aurangabad division, giving the lie to the BJP-SS government's claim that the cases were filed with the intention to spite the upper castes.

Besides withdrawing the 1,100 cases, the BJP-SS government has also recommended the central government to dilute the severity of the penalties prescribed in the act. But what is the ground reality in Marathawada? A survey conducted by Nirmala Niketan in 95 villages of four districts of Marathawada, namely, Latur, Nanded, Osmanabad and Beed, shows that dalits are subject to harsh treatment even after 48 years of independence. Even today the dalits are barred from 80 per cent of temples and 85 per cent of upper caste houses. In many villages dalits are served tea in separate cups by hoteliers and there are separate dinner sittings for dalits at the marriage ceremonies of the upper castes. In every village surveyed there were separate burial grounds for dalits and the upper castes and in more than half the villages dalits still hold 'polluting' occupations such as scavenging and removing carcasses. In such a feudal set up, it is but natural that the dalits, especially the neo-Buddhists, should become targets of the upper caste ire when they started to openly defy and challenge the village level authority. In the riots that rocked Marathawada in 1978, those neo-Buddhist families which had contested the elections or had got members elected to the post of sarpanch, had participated in the attempts to draw water from public wells, had taken out processions on 'Ambedkar jayanti', had given up the demeaning traditional occupations, or earned enough wealth to purchase land, were assaulted and had to migrate to the cities. In the anti-renaming riots of 1978, Pochiram Kamble was lynched to death in Temburni and his avenging brother, Chandar Kamble, was also eliminated. In 1991 Ambadas Savane, a kotwal, was stoned to

death for seeking shelter in a temple during rains in Deshmukh Pimpri in Parbhani district. In the same year, Satawa Kamble and his two sons were hacked to death in Gothala in Latur district in connection with an inter-family feud. Under such oppressive conditions, the dalits found the anti-atrocities act an effective tool in stemming upper caste tyranny. The upper castes were put on the defensive with many seeking out of court settlements. Hence, the recommendation of the state government to modify provisions in the act is discriminatory. Instead of further arming the weak, this step intends to subject them to worse travails.

The recent assembly elections saw Shiv Sena, which has fomented hatred for the dalits among the caste Hindus, articulating the anger of the landed, aristocratic Marathas of Marathawada at the renaming of the university in 1994. It was the elected group of rebel Congress leaders from Marathawada who extended support to the minority government of the BJP-SS. The threat of Divakar Raote to go on hunger strike if the assurances given to the Marathas of Marathawada were not implemented, was staged to give the impression that the issue had popular support. In fact the threat was aimed to rally together other supporting rebel Congress MLAs from Marathawada and isolate the disgruntled Ashok Patil Dongaonkar. But it is shameful that the major opposition party in the state, the Congress, has not come out strongly against the government's decision. Embroiled in internal rivalry and partly out of an intention not to alienate the caste Hindu votes of Marathawada, the state Congress leadership has shown cowardice and opportunism. Only the republican leaders have voiced their protests, the dalits being their constituency. But the overall message of the BJP-SS government is clear: As with Muslims, it does not give a damn for the neo-Buddhists, neither of whom form the electoral base of the ruling coalition.

WASTE PACT

Local vs Global

THE Third Conference of Parties of the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal (COP III) has unanimously adopted what has been termed the Basel Ban proposal sponsored by the Nordic countries which prohibits transboundary trade in all wastes including those meant for recycling. India was forced to reverse its earlier decision to vote for the alternative draft proposed by the OECD which made a distinction between disposable wastes and recyclable wastes. However, the amendment as passed is a considerably watered down version of the original draft.

India's capitulation followed the decision of the European countries, forced to accommodate green political opinion, to support the Nordic draft. The diluted amendment offers several loopholes which India could exploit in order to ensure the continued import of 'recyclable' wastes.

The amendment is a follow-up to the decision taken at COP II in March 1994 – Decision II/12 – which was a response to the request made by G-77 countries for greater controls on the movement of hazardous wastes especially to third world countries. This was based on growing evidence that Asian and African countries were being used as dumping grounds for hazardous wastes on the pretext that these were for recycling. Decision II/12 had two major components: the movement of disposable wastes from OECD countries to non-OECD countries be banned with immediate effect; while the movement of recyclable wastes be prohibited from January 1, 1998.

India's argument has been, and is, that the recycling industry which depends on the import of wastes employs a large workforce and is a significant part of the industrial sector, and a ban on waste imports would put this sector in jeopardy. And yet, there is available no real estimate of either the workforce or the spread of such industry. India imports metal wastes, zinc ash, lead dross, mineral tailings, etc. The original Basel Convention's criteria for allowing the import of such wastes was based on a tacit acceptance of the needs of such industries in third world countries. While in industrial countries the process of recovery would be too high to be viable, in poorer countries, with the availability of cheap labour, these wastes could be fully utilised, provided there were adequate pollution controls. What has been ignored, however, is the fact that most third world countries have very poor and ineffective mechanisms for controlling and monitoring pollution. In India for instance, although there exists codified rules for the handling of hazardous wastes, most recycling industries, a majority of which are in the organised sector, do not conform to these rules. And nor are there mechanisms which can track down and punish offenders.

On the eve of COP III, a group of environmentalists led by Greenpeace released a report about the lack of controls for waste disposal and handling in a state-sector 'secondary' zinc producer, Bharat Zinc. Whether these allegations are true or not, the point is that the department concerned has little control over these matters, even in the organised sector, leave alone the thousands of small producers. This, in fact, is the problem with regard to global environmental protection mechanisms. While third world countries sign conventions and become parties to agreements, the only way they can keep the promises they

make is in fact, to kill the unorganised sectors of industry. And yet, with the acceptance of structural adjustment programmes, production will be increasingly shifted to the unorganised sector. What will happen in effect is that those requirements of international agreements which will affect transnational movements will be better monitored, while those that have an impact at the local level – local consumers or workers or the environment – will be neglected. A case in point is the azo dyes issue (*EPW*, July 15). Another issue is the environment ministry's decision to prohibit the setting up of industries which would manufacture ozone depleting substances, while doing nothing about large multinational companies manufacturing hazardous substances. Moreover, when the technology changeover takes place, India would become an importing country, since it does not manufacture adequate quantities of alternative chemicals. Thus, unless there is a concomitant commitment on the part of third world governments to protect their local environments and ensure the security and livelihoods of their people, the global environment movement may ironically enough jeopardise lives and livelihoods in the developing world.

NUCLEAR TESTS

Multi-hued Protest

CHIRAC's ambition of gaining popular support by pursuing what is now seen, especially in Europe, to be a wholly irrelevant goal of securing French sovereignty by creating and maintaining a nuclear defence capability is getting him into deep trouble, both at home and abroad. Sheer pig-headedness has now resulted in a second more powerful detonation in the Mururoa atoll in the South Pacific. Quite apart from the widespread protest in Europe, Australia, New Zealand and of course the South Pacific islands, an opinion poll has shown that over 78 per cent of the French are against the development of a new generation of nuclear weapons for which the tests are deemed necessary. Interestingly, more than 1,200 French scientists and 1,000 others from Europe have jointly issued a letter in which they have pointed out that there are alternative ways of testing even if such new systems were thought to be necessary.

It is entirely possible that Chirac in deciding to resume testing after a gap of eight years quite misinterpreted the lull in the peace movements which had been so vocal during the cold war years in Europe and elsewhere. The fact that there is hardly an environment movement in France and that the country has been going ahead with the largest nuclear energy programme in the world with little protest probably contributed to the lack of appreciation of the new

concepts which have emerged in the wake of the new international order. With the legitimisation of environmental concerns in the form of international conferences, conventions and agreements, France could certainly not have tested its devices within Europe. However, whereas in another time and age, the testing of nuclear devices in a colony far removed from Europe would have been acceptable, today it is not. And not the least of the reasons is the protest from the big nations neighbouring the Mururoa atoll, Australia and New Zealand. A significant factor for the continued and growing protest has been the emergence of what is being termed the concept of environmental sovereignty which places global concerns over national. Thus the fact that the atoll sinks an inch with every explosion and that the radiation released by the tests are trapped, safely for now, within the geological formations with no future guarantees against their release, are sufficient reasons for protests not just in the South Pacific areas but in Europe and the US as well. While, undoubtedly, narrower concerns prevail among a section of the protestors and the governments demanding that the French tests be abandoned, a broad enough consensus has clearly emerged which is largely green, not necessarily red, but definitely anti-nuclear.

Another development has also contributed to the protests: the independence movement in French Tahiti has linked the stopping of the tests to the granting of independence to French colonies in the region. The argument, which made a forceful impact last month, is that unless France grants freedom to these colonies, there will be no way of controlling the destruction of the region through its use as a testing ground. The recent US decision to participate in the creation of a South Pacific Nuclear Free Zone which will ensure that the signatory nations will refrain from transporting, testing and even using the threat of nuclear weapons against countries in the region will laterally strengthen the movement. Interestingly, Australia and New Zealand have, when accused by France of supporting the independence movement and wanting French interests out of the region, rather promptly denied the charge. While both have taken strong action against France, and it is likely that the 50th session of the UN General Assembly may see the passage of a resolution protesting against the French tests, they have more limited objectives – to prevent the destruction of the South Pacific area, which is bound to affect them. Ironically, and rather short-sightedly, India has refrained from supporting the protest. At the IAEA meet just concluded, it did not sign a resolution protesting against the French resumption of the tests, confining its statement to a global concern for nuclear proliferation.

MAHINDRA & MAHINDRA

New Ventures

THE company closed the financial year ended March 1995 with a sales turnover of Rs 1,707 crore, up by 20 per cent from Rs 1,419 crore achieved in the previous year. Other income rose to Rs 96 crore from Rs 64 crore, an important component being dividend income which stood at Rs 18 crore against Rs 3 crore in the previous year. Interest costs came down from Rs 56 crore to Rs 45 crore, a fall of 20 per cent. Non-operating profit was Rs 5 crore against a loss of Rs 13 crore in the previous year. The company achieved a gross profit of Rs 222 crore, up from Rs 118 crore in the previous year, a rise of 88 per cent. The effect of a fall in the provision for depreciation by 4 per cent was nullified by a rise in provision for tax which rose from Rs 15 crore to Rs 62 crore. Nevertheless the company ended up comfortably with a net profit of Rs 117 crore up from Rs 68 crore, a rise of 72 per cent.

During the year under review, the company produced 47,638 vehicles compared to 47,110 vehicles in the previous year. Sales stood at 49,108 vehicles against 46,251 in the previous year, registering a growth of 6.18 per cent in volume terms over the previous year. Sales of spare parts registered an increase of 25.06 per cent from Rs 47.64 crore to Rs 59.58 crore. The company hopes to introduce a wider range of vehicles, some of which are to be introduced in the current year.

An increase of 15 per cent in production from 8,877 MT to 10,216 MT and an increase of 15.6 per cent in sales marked the performance of the metal pressing unit. With plans to focus more on the core business of manufacturing cars, the company has decided to transfer the metal pressing unit at Kanhe to a new entity, Mahindra Stampings, in which M&M will hold about Rs 25 crore equity.

Easy availability of bank finance, support from NABARD, good monsoons and better prices saw improved performance by the tractor division. Industry sales increased by 19 per cent, as 1,64,272 tractors were sold against 1,38,060 in the previous year. The company's tractor sales increased from 32,875 tractors to 41,006, an increase of 24.7 per cent. The company's market share rose from 23.8 per cent to 25 per cent, enabling the company to retain its position as market leader for the 12th consecutive year. The sale of spare parts, kits, attachments and implements was Rs 43.47 crore against Rs 37.27 crore, a rise of 16.6 per cent.

The year saw the company capture several export markets, including in African countries like Kenya, Namibia, Botswana,

Mozambique, Zaire and Uganda. Exports to Nepal and Sri Lanka also went up. Tractor exports stood at 857 units against 141 units last year. Exports to the US increased to 536 units against 52 in the previous year. During the year a new company, Mahindra USA, was established in Texas, with the objective of increasing tractor sales in the US. Moving ahead with its export drive, the company is setting up two assembly units, one in Africa and the other in Slovakia. The company, which entered the African market with Mahindra utility vehicles and tractors in early 1994, has exported 1,300 units till date and its decision to set up a plant in Africa reflects this encouraging response. The assembly unit is to be in place in four months and will assemble 250 vehicles per month from components sourced from M&M in India.

The company has entered into a joint venture to manufacture and distribute a range of passenger cars in the country. To begin with it proposes to undertake the manufacture of two ranges of passenger cars, the Ford Escort and the Ford Fiesta, with an initial capacity of 100,000 cars per annum. Later on manufacturing will be expanded to include the entire range of Ford vehicles. Manufacturing operations are expected to begin in May next year. The cost of the project is estimated to be Rs 2,000 crore. The first phase envisages operations being carried out at the company's existing capacity at Nashik using imported completely knocked down (CKD) packs, starting with 20 per cent indigenously procured components. Later production of other Ford vehicles will be undertaken at a different site which will be developed into a fully integrated automotive plant at an estimated cost of Rs 1,500 to Rs 2,100 crore. M&M and Ford will subscribe equally to the initial capital. To support this plan, the plant at Nashik is to acquire a new paint facility, new tooling, assembly lines and power distribution systems. The Indian-built Ford vehicles will be sold by Mahindra Ford India under the Ford brand. The company is planning to enter the area of infrastructure development, trade and financial services, telecom and software. In the field of telecommunications, the company has tied up with British Telecommunication (BT) of UK, to form Mahindra British Telecommunications. Besides automobiles, the company is focusing on property development, hotels and ancillary manufacture. The company has promoted a subsidiary, Mahindra Realty and Infrastructure Developers (MRIDL), which will carry out all activities and ongoing projects of the property development division. In December 1994, Mahindra Nissan Allwyn was merged with Mahindra & Mahindra, the parent company.

GODREJ SOAPS

Rise in Sales

The story of Godrej Soaps begins in 1930, with the simple idea of production of quality soaps from vegetable oils. Today it is known as India's leading consumer product company. The company operates from two plants, one at Vikhroli in Bombay set up in 1964 and the other at Malanpur in Madhya Pradesh set up in 1991. The varied products range includes cosmetics like talcum powder, hair dyes, shaving creams, diagnostic products and edible and non-edible oils.

The company closed the year ended March 1995 with net sales of Rs 527 crore, up by 42 per cent, against Rs 372 crore last year. Other income fell from Rs 27 crore to Rs 11 crore, primarily due to a fall in interest income from Rs 15 crore to Rs 8 crore. Total income rose by 41 per cent from Rs 399 crore to Rs 561 crore. An increase in the provision for depreciation was offset by a decline in provision for tax, leaving the company with a net profit of Rs 27 crore as against Rs 25 crore in the previous year. A dividend of 16 per cent has been recommended by the directors.

Exports for the year under review stood at Rs 23 crore, up from Rs 11 crore in the previous year. Imports moved up from Rs 23 crore in the previous year to Rs 85 crore. In deviating from the usual practice of merging a loss-making unit with a profit-making one, the Godrej group went in for a reverse merger and merged the profit-making Godrej Soaps with the loss-making Gujarat-Godrej Innovative Chemicals in April 1994. The name of the new company is Godrej Soaps. The reason was that in the case of a normal merger GGICL's losses of Rs 96 crore would remain where they are and, combined with GSL's profit of Rs 27 crore, the net effect would be only mounting losses for the company. On the other hand, a reversal of the merger allows a write down of the loss-making company's capital to the extent of losses accumulated. Thus GGICL's Rs 96 crore of piled up losses would be deducted from Rs 104 crore of its share capital, leaving a balance of Rs 8 crore as the reduced share capital, which could be added to GSL's existing share capital.

During the year under review, the company acquired a majority share holding in Transelektra Domestic Products, the largest manufacturer of mosquito mats in the world. TDPL has a market share of more than 50 per cent in the household insecticides market in India. TDPL has manufacturing facilities at Madras, Pondicherry and Vasai, apart from branches all over India. The company has acquired another mosquito mat

manufacturer, Jet Homecare Products, effective last month at an investment of Rs 30 crore. The year under review saw the strengthening of the company's marketing alliance with Procter and Gamble. The joint venture set up in March 1993 called Procter and Gamble Godrej (PGG) is owned by P&G and Godrej with the former having a 51 per cent share and the latter holding the rest. Under the agreement, Godrej Soaps sold its business of marketing, distribution and sale of toilet soaps, detergents, trademarks, technology and goodwill to Procter & Gamble Godrej for Rs 400 million.

In April this year the company entered into a joint venture and technical assistance agreements with Siat SA, a Belgian company, for the oil palm plantations business of the company in Andhra Pradesh. Through Godrej Oil Palm Konkani the company is to set up palm oil mills and processing factories for downstream projects. The Belgian company is to have a 20 per cent stake with 80 per cent being held by Godrej Soaps and group companies. In the initial phase the plant is to have a crushing capacity of 10 tonnes per hour of fresh fruit. The first phase would take around 16 months to complete, with the plant likely to be commissioned in March 1997. In the second phase, likely to start in March 1999, the company will invest a further Rs 5 crore to increase the capacity to 20 tph. The company is setting up a third plant in Andhra Pradesh to manufacture soaps, increasing its capacity from 60,000 tonnes to 80,000 tonnes by 1997.

INDO GULF FERTILISERS

Copper Smelter Project

Despite government control over the fertiliser industry and a temporary shut down due to a combination of overflowing stocks and shortage of raw materials such as coal and rock phosphate, brought about by a severe scarcity of transportation rakes, Indo Gulf Fertilisers and Chemicals Corporation, an Aditya Birla group company, has put up a satisfactory performance. The company notched up sales of Rs 435 crore, up from Rs 409 crore. While total income rose by a modest 14 per cent, operating profit increased by 22 per cent. The company successfully reduced its interest costs from Rs 43 crore to Rs 31 crore. Provision for depreciation rose by 10 per cent. The company ended up with a net profit of Rs 169 crore against Rs 125 crore. A dividend of 15 per cent has been recommended by the directors.

The company spent Rs 54 crore on power and fuel as against Rs 39 crore last year. Tight supply of natural gas led the company to use naphtha, a costlier alternative. Consumption of nitrogenous fertilisers has grown by 7 per cent in the last 10 years. Despite a few large urea plants having started production in the last few years, demand far

outstrips supply and estimated urea imports in 1993-94 and 1994-95 have been around 2.84 million tonnes and 3 million tonnes respectively. With the international price of urea remaining firm on account of high demand and short supply, the cost of imported urea works out to Rs 8,500 per tonne against Rs 5,500 per tonne for urea produced domestically. The company's production of urea increased by 14 per cent to 7.84 lakh tonnes in 1994-95 compared to 6.85 lakh tonnes in the previous year. The installed capacity of ammonia and urea is 1,350 metric tonnes per day and 2,200 metric tonnes per day, respectively.

The company has chosen Haldor Topsoe, the original technology suppliers, as consultants. Revitalising operations and improving energy consumption will be the thrust of the upgradation plans. The company has decided not to expand its urea capacity in the face of difficulties in the availability of natural gas and hence has diversified into the core sectors of paper and copper. The company is planning to invest around Rs 2,900 crore in these two projects over the next three years.

Expecting a significant rise in copper consumption in the country, the company is setting up a 1 lakh tpa copper smelter plant at Dahej in Gujarat at a cost of Rs 1,550 crore, with a built-in provision to expand capacity to 1.5 lakh tpa. Every tonne of copper produced generates 3 tonnes of sulphuric acid which is mainly consumed for phosphatic fertilisers. The project will be set up on the flash smelting technology of Outokumpu, Finland, and is expected to go on stream in the last quarter of 1997.

The present per capita consumption of paper in India is 3.2 kg against a global average of 45 kg. It is expected that the demand for paper and newsprint will increase to around 4.9 million tpa by 2000 AD as against a production then of only 3.5 million tpa, even after taking expansions and new capacities into account. The company is setting up a plant at Bijnor in Uttar Pradesh at an estimated cost of Rs 1,350 crore and PT Indo Bharat Rayon of Indonesia is participating in the equity capital to the tune of Rs 120 crore. The sugar mill will have a capacity of 5,000 tonnes crushed per day (tcd) and will provide a substantial part of the bagasse required for the paper plant. The company is planning to enter the power sector and to this effect is planning to invest Rs 35 crore in the equity of two projects, one at Rosa in Uttar Pradesh with a capacity of 750 MW and another at Bina in Madhya Pradesh with a capacity of 1,000 MW. The power projects of the company will be pursued through two of its recently formed associate companies, Rosa Power and Bina Power. The company is also entering the telecommunication business by co-promoting Birla Telecom and Birla Communications to provide cellular mobile telephone services.

CURRENT STATISTICS

EPW Research Foundation

In the first two months of 1995-96, industrial output rose by 14.2 per cent as against 7.4 per cent last year. Acceleration in the growth of foreign trade is continuing with import growth (37.4 per cent) outstripping export growth (28.3 per cent) and thus widening the trade deficit further to about \$2 billion during April-August 1995. While deposit growth remains sluggish with over-the-month rise of Rs 2,045 crore, non-food advances have risen by Rs 4,048 crore in the same period. Liquidity pressure has begun to be felt in the money market and external sector pressures on the rupee's exchange rate. Apart from high call money rates, yields on 91-day and 364-day T-Bills have edged up in their primary floatations. The havalra rate (Dubai) shot up to a new high of Rs 36.15 to a US dollar in the last week of September, following the sharp depreciation of the rupee in the domestic forex market.

Informal Censorship

A G Noorani

Books, journals and pamphlets are being subjected to an informal censorship by various authorities in the smaller towns and areas outside the metros.

IF the fundamental right to freedom of speech and expression embodied in article 19(1) (a) of the Constitution is to have any meaning it must be respected by all authorities of the state, as defined in article 12: right up from "all (local or other) authorities" to parliament and the government of India. They cannot violate this or for that matter other rights with the confidence that not many can move high courts by writs.

Likewise, if civil liberties bodies are to perform their roles properly then concern must not be limited to issues of high publicity value to their leaders. They must promptly register their protests no sooner they read or hear of the violation of civil liberties. *The Hindu* is published all over in the south and in Gurgaon ensuring its distribution in New Delhi. Why, then, the silence on the report in its issue of August 23 by its correspondent K Raghunathan on officialdom's strange behaviour towards a countryside weekly in the Nilgiris, *Downtown Chronicle*. According to the report a former chairman of the Atomic Energy Commission, M R Srinivasan, contributed a couple of articles on birds to the weekly and "the administration is out to cage him". The magazine deals with issues of local relevance only.

Among them is the Tamil Nadu government's proposal to spend Rs 30 crore on the beautification of the lake in Ooty. The journal suggested that the residents should be involved in the project. Likewise on a new approach road which would affect the ecology of the region. The report says:

Dr Srinivasan is among 20 persons including the editor of the magazine who have been hauled over the coals by the administration for write-ups which in its opinion were distorted. They had been issued with show cause notices and summons to appear before the subdivisional magistrate who, Dr Srinivasan said, had adjourned the hearing so far thrice and had also rejected their vakalats filed through lawyers. "We travelled down to Coonoor only to see the magistrate's office closed." They were informed of the postponement of the case by the clerk on duty

What is worse, the authorities had threatened to cancel the registration of the magazine. This is a sure case of harassment of responsible citizens on completely untenable grounds. I understand that the district administration had in the past also indulged in intimidating people through the mechanism of frequent appearances before the sub-divisional magistrate and adjournment without hearing. Charging the administration with acting in an extremely highhanded and arbitrary manner, he said the rules and regulations enacted in the colonial era were being used to muzzle the freedom of the press. Even according to the repressive act, only the printer and the editor were liable for action and not contributors of articles and the staff of the newspaper or the journal. Dr Srinivasan said that the editor of the magazine would be moving the High Court to seek legal redressal. The kind of harassment the *Downtown Chronicle* had been subjected to would not have happened in any of the big cities because the media was already sufficiently strong and well established.

On this he has been proved wrong as Hasan Suroor's report in *The Hindu* of September 9 proves. He reports that as well as holding up consignments of books, customs authorities even venture to exercise control over 'goods' cleared; that is books on the shelves of bookshops. Book-sellers have received notices from customs authorities directing them not to sell Salman Rushdie's new novel *The Moor's Last Sigh*. The book has already been widely received and sold.

According to Hasan Suroor book sellers in "the comparatively smaller places Vijayawada, Bhopal, Indore among others" have been targeted, leaving the 'metros' free. Publishing circles call it an 'informal ban'. Bhopal is a state capital, however. For over a year there has been an informal ban on Alastair Lamb's book *Birth of a Tragedy: Kashmir 1947*. It is based on archival material and demolishes many a myth. Paula Newberg's slim pamphlet on Kashmir was released. It could do no harm to our myths on Kashmir. But not Lamb's book. Not one civil liberties' organisation or one of our civil libertarians who love the public limelight has voiced any protest. It would presumably be unpatriotic to do so. The book has been subjected to an 'informal' but highly effective ban. Book sellers I spoke to in New Delhi had the same story to tell - they were businessmen, not agitators, so are the importers. But what business are our civil libertarians engaged in?

CWDS invites application for Faculty Positions at the level of Senior/Junior Fellows in the scales equivalent to Professor/Reader/Lecturer.

Essential Qualification: First or high second class Masters degree in Economics, History, Politics, Sociology, Law with Doctoral degree or equivalent published work/evidence of proven research capability.

Desirable: Experience of research and/or action or involvement in issues relating to women and development, or the rights of the child, and environmental studies.

Last Date of Receipt of Application: 31-10-1995

Apply with full details to

The Director,
Centre for Women's Development Studies,
25 Bhai Vir Singh Marg,
New Delhi-110001.

Slum Rehabilitation: 40 Lakh Free Lunches?

Shirish B Patel

The Maharashtra government has accepted that slum-dwellers are an essential part of the city and that they deserve to enter the formal housing sector. The land on which they happen to be is to be transferred to them, as something they own, and 'pucca' buildings are to be built for them by builders anxious to make profits out of the free-sale component that is offered as an incentive. A careful examination of the scheme makes it clear however, that implementing it is not a matter of really serious concern for the government. A few free lunches there may be, but nowhere near 40 lakhs.

IN about August 1990 Shiv Sena chief Bal Thackeray presented a proposal to Maharashtra's chief minister Sharad Pawar suggesting that reconstruction of slums in Bombay as pucca multi-storeyed buildings be permitted on the understanding that on the same plot, not counting the built-up area of these buildings, the full available FSI¹ (1.33 in the island city, 1.0 in the suburbs) would be permitted as additional construction for sale in the market. Profits from the open-market sales would finance the multi-storeyed slum reconstruction.

That proposal became part of the BJP-Shiv Sena's election manifesto. Now that they are in power, this statement of policy has been translated into what government considers an implementable action plan. This was published in July 1995 as the 'Programme for the Rehabilitation of Slum and Hutment Dwellers in Brihan Mumbai', prepared by a Study Group under the chairmanship of Dinesh K. Alzalpurkar.

In outline, the scheme is as follows. All slum pockets in the city, and all households living in them, will first be identified. Electoral rolls will be used to separate genuine from bogus claimants. Each household, regardless of size, will be entitled to a flat of 225 sq ft carpet area in a multi-storeyed building built on the same plot, with or without lifts as determined by the site dimensions and building regulations. In proportion to the built-up area of rehabilitation, determined by the number of families and the prescribed area per flat, an additional construction for 'free-sale' will be permitted. This free-sale area will be 75 per cent of the rehabilitation area in the island city, 100 per cent in the suburbs, and 133 per cent in Dharavi. The limit of construction on the slum pocket will be 2.5 times the land area, and the free-sale area must first be consumed on the same slum pocket, except in Dharavi where this requirement does not apply. Any residual free-sale area available thereafter can be used as a TDR² in any permitted 'receiving

area'. Many plots in the suburbs, where the FSI has been 1.0 for many years, are potential 'receiving areas', since they are permitted an additional 0.4 FSI for TDRs deriving from lands surrendered elsewhere for public amenities, and a further 0.4 FSI for TDRs deriving from the present slum programme (and, incidentally, another 0.2 FSI for land surrendered for a road or other amenity cutting into the plot receiving the TDR).

To give an example, suppose the count of families on a one hectare (10,000 sq m) plot is 600. A carpet area of 20.9 sq m (225 sq ft), which excludes wall thicknesses and common areas, with excellent and economical design might translate into 28 sq m of built-up area per flat, 600 families each with 28 sq m built up area yields a total built-up area of $600 \times 28 = 16,800$ sq m, or 1.68 times the plot area. In the suburbs, the free-sale area allowed will then be another 1.68 times the plot area (another 16,800 sq m), or a built-up total of 3.36 of the plot area, or 33,600 sq m. Of this, a factor of 2.5 or 25,000 sq m in this case must be built on the same plot, and since 16,000 sq m is the area used for slum rehabilitation, this leaves a free-sale area on the plot of 9,000 sq m. The balance $33,600 - 25,000 = 8,600$ sq m left over can be constructed and sold elsewhere in the suburbs.

There is, incidentally, no upper limit on the reconstruction area on a plot. If the number of families living on a one hectare plot is 900, and this is by no means inconceivable, the rehabilitation component on a plot could well be 2.5 times the plot area. The free-sale area would then be a further 2.5 times the plot area, all of it to be consumed somewhere else, since on no plot can the built-up area exceed the factor of 2.5.

A new Slum Development Authority (SDA) will be set up to manage this programme. The actual construction will be by the city's developers and builders, who, it is presumed, will be sufficiently excited by the prospect of the free-sale component

to want to undertake the construction of the rehabilitation blocks. The SDA's main tasks will be to determine how many and which are the qualifying households in each slum pocket; whether certain obviously high-profit pockets need to be 'linked' with other very low-profit ones so that both are taken up by the same developer or not at all; since the ownership of land, or at least a long lease on it, is to be transferred to a slum-dwellers' co-operative, negotiating a price with the existing land-owners, using the threat of acquisition to oblige them to be reasonable; convincing the central government that its lands which are encroached upon should be handed over to the slum-dwellers; ensuring that flats given to slum-dwellers under this scheme are not transferred to anyone else for 10 years, that transferees thereafter pay a transfer fee that is so high that purchasing a rehab flat is prohibitively costly; and that there are no new slum encroachments in Bombay. These are onerous responsibilities, so the SDA will be headed by an officer of the rank of principal secretary.

The extracts that follow have been taken from the report. Comments follow each set of extracts.

*

The slums and hutment-dwellers of unauthorised structures form an integral part of this vibrant metropolis. All of them undoubtedly have a share in the growth, status and prosperity of this great city.³

Slum-dwellers have not willingly chosen their shanty structures and unhygienic environment but have been driven to this option sheerly [sic] due to compelling circumstances as they were thrown out of the formal housing sector, the latter being unaffordable and much beyond their income levels. It is imperative to enhance their standard of living and for which an authorised dwelling unit is a first step in the right direction.⁴

What a remarkable turn-around in official attitudes. Until now slum-dwellers were considered to be unauthorised, illegal occupants of others' property. Their 'encroachments' were regarded as a blight on the city, to be cleared by bulldozer at the earliest opportunity. In their toilet-free areas, their morning predilections for open-air performances were regarded as a degradation and a shame to all, as if they had any real choice.

From all this, to being acknowledged as contributors to the city's prosperity! A position won, let us be clear, by the weight of their voting numbers. But still, to now have an acknowledged right to housing in the city, with water supply and sanitation! Even if the programme is a failure in every other way, as long as this right survives, and future policies are based on it, much will have been achieved. And there is more.

Even though it is agreed that there is no free lunch and that of goods free of cost to the public is frowned upon, it should also be considered that the economic principles start operating only after the bare essentials such

as food, clothes and shelter are provided. Hence, the joint manifesto of the present government of Maharashtra has incorporated the provision of free delivery of houses for 40 lakh slum-dwellers in Brihan Mumbai.

This is not as dreadful as it sounds. That the laws of economics can be temporarily suspended in a worthy cause, by government fiat, is not what is intended. What is meant, and this becomes clear from the rest of the report, is that the 'free lunch' of slum-dwellers is to be paid for by the better-heeled residents of the city.

The report does not say so in so many words, but this is fair enough, since it is the whole city in general, and the better off in particular, who ultimately benefit from the low-cost services provided by slum-dwellers. All these past decades, employers have been free to create jobs in the city, whether in manufacturing or services, recreation, tourism, restauranting, or offices of any kind. Indeed, they have been encouraged to create more jobs, to move here rather than elsewhere in India. None of these employers has to bother in the least about where his new staff are lodged. Government also has made no effort either to provide low-income housing, or to provide serviced land on which poor people could build their own tenements. Such land, if made available, needs to be scattered all over the city, so that poor people are reasonably close to where they work. As the report says elsewhere:

About 65 per cent of the household income in hutments is spent on food and it is only the remaining 35 per cent which, on an average, is available for other necessities like housing, health, education, etc. This is grossly inadequate to meet these necessities. Therefore, slum and hutment dwellers select locations which are close to their places of work to save on transport or secure employment opportunities or places of work at close distance.

It is the creation of jobs, menial and not so menial, that attracts people to the city. If neither the employer nor government is concerned with housing the job-holders, where do they live? They squat illegally, they encroach, they manage somehow. If government now proposes that the high prices the middle and higher income groups are paying for their flats should become a source of funding to resettle slum-dwellers, this seems perfectly reasonable and sound in principle.

So we have several admirable departures from past practice: first, the acknowledgement that the poor have a right to be accommodated in the city, instead of being under the constant threat, as they were until now, of summary deportation. Second, the recognition, albeit dimly perceived, that the right to build on a plot is a remarkable commodity, and can be a significant source of funding. And third, we have a rare attempt to address a problem in its full scope, instead of tinkering with it through government agencies like MHADA and CIDCO: an attempt to harness the construction capacity, finance and enterprise of a host of builders.

This said, we must recognise that the

scheme has too many flaws, and is quite unlikely to succeed in anything other than a marginal way.

*

1990... the number of families who live in hutments and slums of kachha structures with unhygienic conditions was estimated to be around 8.05 lakhs. Number of persons: around 40 lakhs.

there are 2,335 pockets having 9,02,015 structures. The square footage of construction involved will be 265 lakhs (excluding the construction of the free sale component). This on a reasonable basis will involve an outlay of 15,900 crores of rupees excluding the cost of construction of the square meterage required for free sale component.

The present level of the combined effort in the field of construction of houses in Mumbai by all the agencies involved in this work, like Maharashtra Housing Authority, developers, builders, individuals and other house building institutions, does not go beyond 35,000-40,000 tenements per year. Construction of 9.02 + 10 per cent lakh dwelling units for slum and hutment-dwellers and about 1 to 1.5 lakh transit tenements totalling 11 lakh units in a phased manner would amount to 2 to 2.5 lakh tenements per year (duration of programme 5 to 6 years).

The five to six years for programme duration is one of those airy figures, seen in much of our approach to planning, that has nothing to do with reality. Is it based on the time a civil servant expects to spend in charge of this project, before being transferred elsewhere? Or is it based on the interval between elections? Or is it that we cannot think beyond five-year plans? Or is it the administrator's nose sniffing out what his political master wants to hear?

Whatever it is, there seems to be no recognition that construction is an industry. As in any other industry, there is a time lag between a decision to enlarge capacity and the achieving of that capacity. Capacity enlargement has to be managed, it does not happen of itself.

There is no way an industry producing 35,000 to 40,000 tenements a year can expand several-fold to deliver 2 to 2.5 lakh tenements a year, starting next year. Construction material supplies, the number of construction workers, and the number of construction managers all have to grow many times above their present levels. The hardest numbers to grow are the workers and managers. Since the report does not address this issue in any serious way, are we to take it the programme is not really serious about its implementation? Is this all a pre-election stunt? A bewitching dream that will evaporate within minutes of our waking up?

*

the massive housing effort that is required to be undertaken will call for adoption of modern construction technology, use of prefabricated material.

Adoption of Prefab Technology... all that needs to be done is to identify and earmark the areas for setting up prefabricated production units. At present such earmarking has not been done and therefore appropriate reservations in the Development Plan need to be made.

How extraordinary to believe that earmarking reservations is all this is needed to bring about a revolution in the construction industry. All of us exaggerate the importance of our own professions to the world, and bureaucracy is entitled to be no exception. But to believe that an industry can be transformed by making reservations!

The fact is that prefabricated construction has been a non-competitive option in this country for many decades for two reasons: first, prefabricated products are subject to excise, whereas exactly the same components cast *in situ* are not; and second, a prefabricated factory is likely to have a union to contend with, and consequently higher wages, whereas a construction site escapes these constraints. It is true that prefabricated construction would bring about improved quality. Reduced costs is more doubtful. What you gain by prefabricating you often lose on transportation, and the cost of cranes needed for handling. The major gain, apart from quality, would be in construction capacity. This could be significantly enhanced, without a corresponding rise in numbers of construction workers and managers. It is an option worth pursuing, but removing the obstacles of excise and unions would be no mean achievement for any civil servant.

*

The Group, therefore, recommends as follows:

(1) All the persons living in a dwelling unit of whatever size, will be allotted, for all the persons irrespective of how large the household is a dwelling unit of 225 sq ft of carpet area free of cost.

(2) Commercial area like shops, restaurants, clinics, professional offices, official premises, etc., will be given built up floor space equal to the existing area or measuring 225 sq ft of carpet area, whichever is less. Free of cost.

(3) If the existing commercial area exceeds 225 sq ft of carpet area, then the floor space above 225 sq ft, subject to the maximum being equal to the existing area, be allotted by charging at prevalent market rates.

Pavement-Dwellers: occupation of footpaths is an encroachment not different in character from those occupying other lands on which public amenities exist or are planned.

Giving everyone (including pavement-dwellers) a dwelling unit of 225 sq ft carpet area regardless of household size is a neat-looking simplification, but one wonders whether it will not raise insurmountable resentments, and resistance, on that account, to the scheme from among the beneficiaries themselves. Hutments vary a great deal in size, the smallest being probably around 50 sq ft, more or less a tent one crawls into. The larger ones can be like permanent constructions. Some huts are recent, others have been where they are for decades. Under this programme's dispensation, all are equal. The only unequal ones are those who move to the city after January 1, 1995.

There is an innate sense of justice in people, including the poorest among them, which will cause them to resist an unjust scheme. Perhaps the idea is to win them over by

offering them 225 sq ft carpet area, which is much beyond what any one of them presently has. But a sense of being unfairly done by is built into the scheme, and who knows what complications this can cause in future. In any case, can you really equate a pavement-dweller who does not have a roof over his head with someone who lives in a more or less pucca hut? Or someone who lives in 50 sq ft with a plastic sheet over his head with someone whose tin shed is five times that area? Or a newly arrived pavement-dweller with someone who has had a more or less permanent hut for decades? This sounds so bizarre that one must conclude either that the scheme has not been properly thought through, or, once again, that implementation is not really intended.

When will we get away from our patronising approach to development? Where a ruling group decides what's best for the people, instead of letting them decide this for themselves? The 225 sq ft of carpet area is a 'minimum' dating from Nehru's days, when for a family to live in anything smaller was considered 'inhuman'. This led to programmes of constructing only permanent structures for low-income housing. Given the funds available, these were able to meet only a tiny fraction of the demand. Meanwhile, slums continued to grow and were denied water supply and sanitation because they were 'illegal' (since there was no possibility of their being anything else), and to do anything for them other than a pucca building with 225 sq ft flats would be 'inhuman'. This approach has gradually changed over the years, mainly because of pressure from the World Bank, and several slum improvement schemes are now complete or in progress. But while the approach may have changed, attitudes obviously have not. Our rulers find it just as hard as ever to really help the poor. Set aside for a moment the avowed intentions of the present programme, and look at what the report has to say:

Previous experience whenever slum upgradation or resettlement of slums was undertaken slum-dwellers prefer the slum improvement programme...since the government is now considering the full resettlement of slum-dwellers on a comprehensive basis, the necessity and need for continuing the slum improvement programme does not survive should be tapered off.¹⁴

In other words, a programme that the slum-dwellers want more of is to be discontinued and replaced by another which a superior group has decided is better for them. Why not give slum-dwellers the choice of deciding which they prefer? If the new programme is so much better, surely they will opt for it themselves?

*

...demand for water and for augmentation of sewage disposal facilities would go up substantially from their present levels.¹⁵

From standing in line for hours for a few handas of water, we are being offered a

situation within five or six years where every one of 8 lakh families has a tap and a toilet inside their own-home. The report says:

Existing network of water lines, sewage disposal system, storm water drains and treatment of sewage disposal will have to be strengthened. This will call for augmentation in the availability of drinking water as well as stepping up the present levels of sewage treatment and disposal system. Municipal Corporation will be the executing agency.¹⁶

How this might be funded has been suggested in the report. But how is this to be achieved within the envisaged time span? Are we being at all serious?

*

Measures to Prevent Further Encroachment on Lands. This is by far the most crucial issue equal in importance to the entire slum redevelopment programme. Past experience... preventing further encroachments was not given its due importance... unauthorised encroachment has gone on unabated... firm effective steps... need to be taken to prevent unauthorised encroachments... Mere draconian measures may not help but if such strong effective measures are supplemented by... making available affordable shelter then the firm and effective measures will be justified and legally defensible. The positive measures would be to make affordable housing stock specially rental housing stock available... restrictions of Rent Control Act have been a major factor in completely drying up of the rental housing stock in the market... rights of those who are already tenants is sensitive and therefore that aspect can be left out. But we could take a pragmatic view of future tenancies... standard rent need not be applied to future constructions.¹⁷

So now that the existing 40 lakh slum-dwellers have been settled in permanent homes, the plan is that the newly arrived will move into newly built rented accommodation where the Rent Act does not apply. Who will build this accommodation? Where? On land available at what price? With land prices as they are in Bombay, how could commercial rentals possibly be affordable by the poor? This problem, like many others, has simply been glossed over in the report.

*

About 60 per cent of the slums are on private lands and 40 per cent are on government and publicly owned lands.¹⁸

Transfer of ownership of the land on which the slum-dwellers will be rehabilitated is an important aspect of the programme. This will ensure their legal title to the land and consequently passing of that title by heirship. The Group therefore recommends:

(1) The legal title and ownership of the land on which redevelopment has taken place be transferred by way of lease to the co-operative housing societies or organisations of the slum-dwellers.

(2) ... in practice private lands will be purchased... by the developing agency... land be transferred to the Co-operative Housing Society on freehold basis.

(3) Lands occupied by slums and hutment colonies owned by organisations under the control of central or state government be given

on lease. A letter of intent to lease the relevant and required portion of land be issued to the Co-operative Housing Society of slum-dwellers immediately for its registration. This will give considerable authority to the Co-operative Society to choose the developing agency, appoint an architect or appoint a contractor. (4) The lease should be for thirty years and with a renewal clause. The renewal should be automatic except then there is a breach in the use of the land.¹⁹

All this is admirable. That the ownership of the land on which a slum stands should be transferred to a slum-dwellers' co-operative is beyond the wildest dreams of all the social service organisations that have been working for years within slums - all they have been asking for is security of tenure, with an assurance that the occupants will not be bulldozed off the land at the whim of one agency or another. But there is a catch. This is that the transfer will take place only on completion of the scheme of slum multi-storeyed reconstruction. You cannot continue to live in ground-floor dwellings, however much you improve them, and expect to own the land.

Whyever not? Experience all over the world has made it amply clear that with ownership comes responsibility, a desire to improve one's dwelling and the surroundings, a desire for cleaner, healthier surroundings and a willingness to find the money to do this by one means or another. So why hold back until reconstruction is finished? Why not transfer ownership to the co-operatives at once, and let the development follow, at whatever pace market demand permits? Meanwhile, the improvement in water supply and sewerage facilities could take place at whatever speed the municipal corporation is able to achieve.

The middle classes are well known for wanting to keep those below them firmly in their place. If transferring ownership of land to slum-dwellers is a genuine intention it could be quickly done, starting with state government lands. As an election winner it would surely be more effective than promised reconstruction. So why not do it? Unless of course you intend to stop at promises.

*

The Group therefore recommends

(1) Making a legal provision for non-transferability.

(2) Granting permission in genuine cases by the Slum Rehabilitation Authority after a period of 10 years, and

(3) Evolving a scheme of having a strong economic disincentive based on collection of a large percentage of unearned income. The portion of unearned income to be collected would be on the lower side in genuine cases.²⁰

Non-transferability is considered a central feature of the programme. This arises from the fear that a slum-dweller will sell his newly reconstructed flat and move into another slum. But to whom will he sell it? Another slum-dweller surely, or a middle-income person who has no better accommodation on offer. If it is to another

slum-dweller, then what difference does it make which slum-dweller lives in the multi-storied building and which one in the slum? And if it is to a middle-income person, and you are rehousing all 40 lakh slum-dwellers, there is clearly something wrong with your scheme because you've ignored the middle-income man's problems.

*

...estimate of the monthly outgoings. Tenement holder without a lift will on an average basis have to spend Rs 465 per month of which Rs 350 will go as municipal taxes. From the present level which is not more than Rs 20 per month... service charges levied by the municipal corporation for providing the civic amenities. With a view to giving relief, municipal taxes could be levied in a telescopic manner... 50 per cent of the municipal taxes are levied in the first 10 years. Next 10 years. 70 per cent.²¹

The slum-dweller in his 225 sq ft flat somewhere in the far suburbs will be paying as much municipal tax as someone in a vast and elegant old-rent apartment in south Bombay. There is an urgent need to reform the basis for municipal taxation. Because it is based on 'rateable value', rather than the current market value of a property, it is unfairly biased against new construction. Older buildings, no matter how expensive the locality in which they are, pay very low taxes. Here also, as in so many other instances, this report, instead of addressing the root of the problem, seeks out facile solutions that are unsatisfactory to all.

*

...dwelling units for hutment-dwellers meaning thereby 2.16 cr sq metres of construction. In addition, the saleable component will involve construction of 2.0 cr sq metres of floor space.²² The corner-stone of the programme would be raising of finances from the market through the availability of additional/surplus FSI.²³

Now here is the nub of the matter. Government has accepted that slum-dwellers are an essential part of the city, and that they deserve to enter the formal housing sector. The land on which they happen to be will be transferred to them, as something they own, and whose inheritance they can pass on. And pucca buildings will be built for them by builders anxious to make profits out of the free-sale component that is offered as an incentive.

Two questions arise. First, would a builder be really attracted by this proposition? And second, is there a market for all the new construction?

Let us be clear that the prime source of the money builders have made in recent years in Bombay has been not ownership of land, but scarcity. Demand has overwhelmingly exceeded supply. That previous political leaders have connived at inducing this scarcity can hardly be doubted. The Urban Land Ceiling Act has been a most handy tool. Are builders not well aware that it is scarcity that sustains their profits? Government officers have announced recently that the implementation of this

programme will bring down accommodation prices. Most of us would welcome that. But do the builders want it? After all, they are the key players in this programme, the source of all funding. And if they are unenthusiastic, what happens to the programme?

We should also ask ourselves what 4.16 crore sq metres of new residential construction means for the city. Let us set aside for a moment the horrendous problems of infrastructure that this would impose on the city. Reliable numbers seem to be impossible to come by, but at a rough guess an additional 4.16 crore sq metres would double the built-up residential floor space in the city and suburbs. Half of this would be slum rehabilitation. The other half would be the free-sale component, and this free-sale component would amount to about half of the existing built-up residential floor area in the city and suburbs. Is there really a market for so much new floor space? It is a serious lacuna in the report that it makes no projection of demand for high- and middle-income housing to show that the free-sale component could indeed be sold at prices high enough to support the cost of constructing the rehab buildings.

Consider the numbers that are available. Bombay's population grew from 82 lakhs in 1981 to 99 lakhs in 1991, an annual increase of about 17 lakhs people, or about 34,000 households. The legal supply of housing during this time has been 22,000-25,000 dwelling units per year. Compare this with the plan to build 8 lakh units for slum rehabilitation in the next 5 years. For every 100 sq m of built-up slum reconstruction, there will be another 100 sq m of middle- or high-income housing. We might say that 5 slum-dweller units result in 2 middle-income units. In that case, 8 lakh slum-dweller units would produce a corresponding 3 lakh middle-income units, or about 60,000 additional such units a year,

over and above the 22,000-25,000 units already being added annually. Would there be a demand for so much construction? What happens to prices, and the differential that is supposed to finance the slum reconstruction?

Once again, one is left with the impression that implementing the programme is not a matter of really serious concern. Some schemes will undoubtedly begin, in high-profit slum pockets, some smart builders will make their money, and who can grudge them that, and some slum-dwellers will undoubtedly find themselves in pucca multi-storied buildings instead of their earlier huts. And that will be that. A few free lunches there may be, but nowhere near 40 lakhs.

Notes

- 1 FSI or Floor Space Index, is the ratio of built-up area to plot area
- 2 TDR is Transferable Development Rights, essentially permission to build the area under the TDR on another plot elsewhere in the suburbs.

Building Castles in Air

Housing Scheme for Bombay's Slum-Dwellers

Gurbir Singh
P K Das

The Afzalpurkar report on housing of Bombay's 40 lakh slum-dwellers fails to take its implications to their logical conclusions. With procedures of transit accommodation not clearly worked out and no commitment on the part of the state towards infrastructural development, the scheme has generated a lukewarm response among the builders and may face opposition from the slum-dwellers themselves.

WILD promises and populist, unimplementable schemes have become a hallmark of electoral politics over the years. But the con of free houses being promised to the 40 lakh slum-dwellers of Bombay by the Shiv Sena-BJP government takes the cake. At first, it came as another of those Bal Thackeray pre-election rantings. Nobody took it seriously. But after assuming power, the SS-BJP government appointed a study group headed by D K Afzalpurkar, senior IAS officer and chairman of the Bombay Port Trust, to propose a scheme for providing free houses to slum-dwellers. In little over two months, on July 21, the study group produced its recommendations. And, the state government, without much ado, has announced that it has accepted what has come to be known as the Afzalpurkar report. In keeping with the culture of using auspicious occasions to launch schemes, Bal Thackeray has declared the Slum Rehousing Scheme (SRS) open on Dussera - October 3. (Memory is short, but let us recall that Sharad Pawar's now derailed earthquake reconstruction scheme also started on Dussera day, 1993).

Slum groups and voluntary organisations, who have organised debates on the Afzalpurkar report, have been sceptical about its implementation. But the repeated announcements by the state government affirming the government's intention of implementing the scheme, has sent the expectations of Bombay's nearly 60 lakh slum population skyrocketing. Notwithstanding the scepticism among housing rights organisations and the media, a large section of slum-dwellers genuinely feel that within a short time they will be proud owners of apartments in multi-storey buildings. Woe betide Bal Thackeray if these aspirations are dashed!

HISTORY OF FAILED SCHEMES

This is not the first scheme to rid Bombay of its slums. And it is unlikely that it will be the last. The 'philosophy' of 'cross-subsidy' - that the builders can be made to

subsidise slum development if they are given additional FSI on slum plots as an incentive in order to increase the margin of profits - is at the root of the new SRS. This was also the basis of Sharad Pawar's Slum Redevelopment Scheme (SRD scheme) which was launched with much fanfare in 1991. In fact, the Afzalpurkar recommendations are nothing but a souped up version of the earlier Sharad Pawar's SRD scheme.

Bombay's population over the decades has leapt from a mere 8.13 lakhs in 1901 to nearly 130 lakhs currently. Slums were virtually unknown in 1961, constituting only 10 per cent of the population then. Today, Bombay is a virtual slum city with 55 per cent of its population living in shanty tenements as 'encroachers' on government and private lands. This does not include another 25 per cent of the city's population living in squalid and dilapidated buildings, where conditions are often worse than slums.

In the first two decades after independence, the official approach towards slums was to clear the hutments and rehouse slum-dwellers in permanent structures. An amendment, Section 354 A was introduced in the Bombay Municipal Corporation (BMC) Act to make this legally possible. The cost of constructing a permanent tenement was fixed at Rs 8,000 in 1954, with the union government and the BMC sharing the costs equally. By the end of the 1960s, with the union government refusing to enhance its Rs 4,000 per hut subsidy, and slum structures growing in leaps and bounds, slum clearance as a policy met its demise. The government realised that as conditions in rural areas became more wretched and industrial expansion in the cities attracted people in search of livelihood, migration into the city would spawn slums at a rate beyond the capacity of the slum clearance programme. Thus, slums would have to be tolerated, and the official policy veered around to 'improving' slums rather than 'clearing' them.

The BMC launched its Slum Improvement Programme (SIP) in 1970. The programme envisaged providing basic civic amenities

such as water supply, toilets, roads, drainage and street lights for slum-dwellers. The union government allocated the meagre sum of Rs 2 crore in 1972 for the purpose. A separate machinery, the Maharashtra Slum Improvement Board, was set by the state government in 1974 to co-ordinate this work. When the Maharashtra Housing and Area Development Authority (MHADA) was set up in 1977, the slum board was merged with MHADA.

A BMC report, written a few years ago by the deputy municipal commissioner (slums), K G Pai, estimated the housing stock necessary for clearing slums in Bombay at 10 lakh tenements. Taking a construction cost of Rs 350 per sq ft, and providing for 150 sq ft carpet area per tenement, the report projected the rehousing cost for Bombay's slum-dwellers at Rs 7,000 crore. In this light, the meagre total of Rs 70 crore spent over two decades on the Slum Improvement Programme shows the casual attitude on the part of the planners to improve the lot of slum-dwellers. The BMC report points out that even basic slum improvement measures would require a minimum of Rs 150 crore a year, and goes on to admit that a whopping 30 lakh slum-dwellers have not been touched by the so-called slum improvement programme.

So far the state government's method of tackling the problem of burgeoning slums has been by wearing the blinkers of 'cut-off' dates. At first, the government defined a 'legitimate slum' - one that was recognised under the Maharashtra Slums Improvement Act, and thus qualified for basic civic amenities and protected against demolitions - as one whose residents were enumerated in 1976, and were provided photopasses. The cut-off date was thereafter extended to 1980, and later, after widespread agitation in 1987, to those figuring in the voters list of 1985. As things stand today, slums which have come up after 1985 do not exist for the state government and the BMC. By this method, 50 per cent of the reality has been wished away.

After the failure of the SIP the state government in 1985 launched the Slum Upgradation Programme (SUP), in collaboration with the World Bank and the BMC. This programme sought to transfer the bulk of the burden of development on the slum-dwellers themselves. While providing some civic amenities, the programme envisaged slum housing co-operatives undertaking slum development in exchange for transfer of land tenure and housing loans to the slum co-operatives. A modest target of one lakh tenements - one-tenth of the total slums in the city - was projected for coverage under the scheme. However, till 1993, only 22,000 households have been covered, and the programme has been virtually given up as a failure.

SHARAD PAWAR'S SRD SCHEME

The government's answer to this string of failures was not greater involvement in the field of housing for the poor, but to withdraw and give the field to the builders and private developers. Significantly, Sharad Pawar's builder-propelled SRD Scheme came in March 1991 in consonance with the unfolding of the New Economic Policy by the newly-installed Narasimha Rao government. Privatisation and withdrawal of government subsidies, the watchwords of the NEP, was sought to be applied with a vengeance to the housing sector too. By that time, Sharad Pawar, as the chief minister of Maharashtra, had also unveiled his plans to convert the city into another Singapore -- of slowly shifting out or shutting manufacturing activity starting with the city's 60 textile mills, converting factory lands into lucrative real estate, and making Bombay primarily a commercial and financial centre of the country. Slums, therefore, did not fit into these grandiose plans. Significantly, the first slums targeted for eviction, bearing the approval of the union transport minister, Gulam Nabi Azad, were those surrounding the Sahar airport.

Under the new development control regulations, introduced for the city in March 1991, private developers were invited to rehouse slums in small flats of a minimum of 180 sq ft carpet area. In return, the developer would be granted an FSI of 2.5 on slum plots instead of the 1.0 FSI prevailing in the suburbs, and 1.33 in the island city. (Floor-space index (FSI) determines how high a building can be built, and is directly proportional to the size of the plot. For example, an FSI of 1.0 on a 1,000 sq metre plot means that the total floor space constructed in the building should not exceed 1,000 sq m.) After constructing the slum rehabilitation units on a given plot, the developer was free to construct flats and shops for commercial sale, and the government envisaged that part of the profit would go to 'cross-subsidise' the slum houses. Slum-dwellers were also required to pay the builder a minimum of Rs 15,000 of the projected Rs 75,000 cost of a 180 sq ft tenement. This scheme signalled the virtual withdrawal of the government from its social responsibility in the sphere of housing.

The scheme was a non-starter from the beginning. Builders were sceptical, especially the big houses, of getting into wrangles with the slum-dwellers, and preferred to work on unencroached plots with clear titles even though the land costs were astronomical. Those builders who had plans passed under the scheme found they could not start work in the absence of transit accommodation for the slum-dwellers. And the slum-dwellers were rightly reluctant to give possession of their plots in the absence of the builder

providing alternative accommodation. As a result, in a majority of the schemes approved, even till today, not a single brick has been laid. Statistics released by the state government are a glaring revelation. Only 160 schemes were submitted to the government for approval in the nearly four years of existence of the SRD scheme. Of these, the government accorded approval to 89 schemes involving a total of 17,600 dwelling units. However, only four of these 89 projects have taken off and are anywhere near implementation.

THE AFZALPURKAR SCHEME

The Afzalpurkar recommendations have recognised some of the lacunae in Sharad Pawar's SRD scheme, and, while adopting the same approach of 'cross-subsidy', has tried to make a few improvements. In a major departure from the previous SRD scheme, it has made eligibility to the scheme open to all slum-dwellers who figure in the electoral rolls of January 1995. The previous scheme had adopted the 1985 voters list as the cut-off date, thus, effectively leaving out half of the city's slum population. It has also extended the status of 'slums' to the nearly eight lakh pavement-dwellers of Bombay, thus also making them eligible for housing under the scheme (Chapter 20).

The new scheme also seeks to give a better deal to the slum-dwellers by increasing the minimum carpet area to be provided for rehabilitation from 180 sq ft to 225 sq ft, and does away with the requirement of Rs 15,000 to be paid by slum-dwellers to the developing agency. Houses under the new scheme are to be totally free.

Furthermore, it has strongly advocated rehousing slums on site *in situ* and if the residents have to be shifted in case the plot is reserved for an essential public project, or in the case of pavement-dwellers who have to be moved to 'virgin lands', the new location should be within 10 km of the old site. Making these recommendations in Chapter 7, the Afzalpurkar committee envisages that about 80 per cent of the slums can be developed *in situ*. Besides essential reservations in the developmental plan, the committee seems to have overlooked that a large number of slums are situated right on the sea coast, on hillslopes, in the landing and take-off tracks of airplanes and below high tension wires, etc, where building permission cannot be granted under development control rules. Together with pavement-dwellers, the number of slums which will require to be shifted to 'virgin lands' would be as high as 40 per cent. The report is silent as to where and how these 'virgin lands' are going to be made available.

Private developers and builders will be the engine of development for this housing scheme. There will be no financial

contribution or any other assets by the government, which is required to play only a monitoring role. For a scheme that is tailor made for builders, it is ironic that the word 'builder' does not figure anywhere in the report. Instead, the euphemism -- 'developing agency' -- is preferred.

The scheme, which seeks to attract builders to develop slum housing, in return for incentives, has broadly kept to the same formula as the Sharad Pawar's SRD scheme. However, while keeping to the 2.5 FSI principle on slum lands, the Afzalpurkar scheme offers a varied incentive of free-sale component depending on the location of the slum concerned. For the island city, for every 10 sq ft of rehabilitation component constructed by the builder, he is offered a free-sale component of 7.5 sq ft. For the suburbs, the ratio of rehab and free-sale component is equal, while for heavily congested Dharavi, for every 10 sq ft of rehab component, the builder is offered a free sale component of 13.3 sq ft (see table below).

The recommendations have proposed the setting up of a central monitoring and clearing agency, called the Slum Development Authority, which will consider and accord permission to applicants, grant concessions if necessary to the developers, monitor the construction and allotment, and co-ordinate between different government departments. Amendments to the Bombay Municipal Corporation Act and other legislation has been proposed to give this authority sufficient teeth.

To circumvent the problem of transit accommodation faced by the old SRD scheme, the Afzalpurkar recommendations has a special chapter (Chapter 8) to provide incentives for creating transit accommodation. It foresees the need to set up about 1.50 lakh units for transit dwellings, and proposes that vacant government land be made available for it. It offers the same 2.5 FSI as incentive for construction of transit accommodation, as well as possession and exploitation of the accommodation by the 'developing agency' after its use as 'transit

TABLE: RATIO OF REHAB AND FREE SALE COMPONENT FOR DIVISIONS OF BOMBAY

Zone/Area	Construction of the Rehab* Component	Construction of Free Sale Component as Incentive
Island City of Mumbai		
A to G wards	10 sq feet	7.5 sq feet
Suburbs and extended suburbs	10 sq feet	10 sq feet
Difficult area... only Dharavi	10 sq feet	13.3 sq feet

* The incentive for rehabilitating pavement-dwellers has a slightly different formula.

accommodation' is over. However, in keeping with the 'philosophy' of the scheme, the state government will not have any direct hand in providing for transit accommodation, and it will be ultimately the builder's headache.

In a nutshell, the Afzalpurkar scheme has identified 2,335 slum pockets having 9,02,015 huts as the beneficiaries of the scheme. It aims to construct 11 to 11.5 lakh dwelling units (excluding the free-sale houses), amounting to about 265 lakh square metres of construction, a rough outlay of Rs 15,900 crore, and to be completed in five to six years. A tall order indeed.

LACK OF BUILDERS' INTEREST

The mathematics of the scheme makes little sense. If 10 to 12 lakh rehabilitation units for slum-dwellers are to be constructed, then another at least six lakh free-sale units will be required to cross-subsidise the rehab units. This means a gargantuan task of constructing 18 lakh dwelling units. Which means rebuilding the city all over again! The report is blissfully silent on the impact this kind of construction will have on the city's real estate prices. If nearly six lakh dwelling units for sale are released in the market, even in a phased manner, the result will be a crash in prices. This will axe the very basis of the whole scheme – the high profits to cross-subsidise slum housing.

The time frame for the project is five years. Today, the city has a construction rate of 15,000 to 20,000 units a year. Even if this doubled to 40,000 a year, it will take 45 years to complete the project!

The initial builder response has been lukewarm. Some big builders like L.C. Gandhi or Lok Group, Niranjan Hiranandani and Madhav Jog, have been ecstatic about the scheme, and have even floated corporations and public issues to finance their plans. But this group of builders is seen to be close to the Shiv Sena, and were significantly, members of the Afzalpurkar committee. But the rush of the builders for the scheme is visibly absent. This is because a large section of builders see entry into slum plots as full of avoidable imponderables. A slum plot is not a 'clear' one; it comes with its residents aligned with different political groups and shifting interests. Slum residents have been known to oppose a scheme after initially approving it. Or they may demand new terms and conditions. All this may lead to inordinate delays. Big builders are scared of fluid situations and their investments tied up. They want to build quickly, realise their profits, and move on to the next site.

Ranjit Naik, a small builder specialising in slum housing, admitted in an interview (*Asian Age*, July 11, 1995) that though about 60 of his schemes under the SRD project had been cleared, hardly any had been

implemented due to procedural bottlenecks and resistance by the slum-dwellers.

Moreover, the problem of transit accommodation – which builders cite as the previous SRD scheme's Waterloo – has hardly been overcome by the Afzalpurkar scheme. Besides offering some incentives for building transit accommodation, the problem of providing actual space and finance to build these structures has not been addressed. Without proper and accessible transit accommodation, slum-dwellers can hardly be expected to hand over their land to the builders.

For a project involving the construction of 18 lakh dwelling units, the Afzalpurkar scheme has little space dedicated for infrastructure development. Houses cannot be built in the air. They have to come with roads, lighting, drainage, transport systems *et al.* But the report is silent on who will be entrusted with this responsibility – the builders, the BMC or the Slum Development Authority?

The chapter on 'Infrastructure Development' envisages a collection of Rs 75 per sq ft of the rehabilitation component, to be divided on a 1:2 ratio between the Slum Development Authority and the BMC, respectively. Through this method, a total collection of Rs 2,050 crore is projected to finance infrastructure projects. But this kind of budgeting raises more questions than it answers. For instance, why is there no tax on the 'free sale' component for financing infrastructure projects? Second, who will ultimately be responsible for developing infrastructure under the scheme? And where will the money come from? Finally, can the development of infrastructure be left to the collections from the scheme itself? The result of this confusion, which allows the government to abdicate its responsibility in developing infrastructure, could be sheer chaos. For a housing investment of about Rs 33,000 crore (including both the rehab as well as the 'free-sale' component), the necessary infrastructure facilities, taking a low of 50 per cent of the housing investment, will cost at least Rs 16,000 crore. The maximum collection envisaged under the scheme is just about one-tenth of the figure!

Furthermore, the scheme will double the population concentrations on slum plots, which are today already hopelessly overcrowded. This, together with little provision for infrastructure development, will spell virtual environmental disaster for the city if the scheme ever comes up. The report has not even bothered to make provision for the mass migration of construction workers that the scheme will create into the city. At full swing, the projects under the scheme will more than double the existing strength of construction workers, to about three lakhs. Who will cater to their housing and other needs?

RESISTANCE FROM SLUM-DWELLERS

There is likely to be resistance from some sections of slum-dwellers too. While the 'new' slums, which have come up recently, see themselves gaining from the scheme, the 'old' slums, settled before 1980, see it as a losing proposition. Many of the 'old' residents have invested considerable money in their houses, which today are closer to 'chawls' rather than slums. Over the years they have expanded both horizontally and vertically, with most having an upper mezzanine floor. A large section of these 'old' slum-dwellings thus are larger than 250 sq ft, often with a verandah or gallery. For families occupying such dwellings, a boxed-in 225 sq ft tenement in a building would be a step back.

What has not been further realised is that a majority of the 'old' slums in the city are humming industrial estates too. While one part of a slum-dwelling is used as residential accommodation, often one floor is used to conduct some form of industrial or commercial activity. Tailoring and garment units, zari manufacture and a host of other small-scale units abound in the city's slums. This may not be possible, especially where machinery is involved, in small multi-storey apartments.

How quickly this is realised was illustrated by the example of Squatters Colony – a big slum of about 1,200 families situated at Chincholi Phata, in Bombay's suburban Malad area. The local Congress-I corporator, M I Patel, joined hands with a developer called Ambica Builders, and tried to push through a building proposal under the old SRD scheme for the nine-acre plot on which the slum was situated. Initially, a large section of the slum joined in. But then better counsel prevailed and a majority backed out. Leading the war-cry against the Congress corporator in this predominantly Muslim basti were the 300-odd families engaged in 'waraq' production in the slum. ('Waraq' is the silver foil put on sweet-meats and manufactured by extensively flattening silver by placing it between leather plates and beating it with iron lasts.) Somewhere down the line these waraq producers realised that such heavy, noise-making activity would be impossible in multi-storey buildings, and decided to oppose the scheme. They were backed by other families using their dwellings for making trinkets, buckles and cardboard boxes, all of which involve some form of machinery.

Another deterrent seen by the slum-dwellers is the high maintenance costs involved in multi-storey units. Today, a slum-dweller pays between Rs 35-50 as municipal charges. In return, the municipality provides essentials like water and garbage clearance facilities. In the horizontal structures, maintenance is an

easy affair, usually carried out cheaply by the resident family itself.

The Afzalpurkar report tries to mitigate the burden of municipal taxes by reducing the levy to 50 per cent for the first 10 years, and by 30 per cent from the 11th year onwards (Chapter 27). However, the report admits that the minimum outgo per dwelling would be Rs 565 per month for buildings without lift, and Rs 615 per unit for buildings with lift. These charges would not include major repairs required from time to time. With this kind of a maintenance and upkeep budget, which could be half the monthly salary for a large section of slum-dwellers, it is likely that many would prefer to continue to live in easy-to-repair slum-dwellings; and for those who opt for apartments, a mass distress sale and movement back to the pavements could also be a possible scenario.

The Afzalpurkar scheme has found opposition from an unusual quarter. Nilkant Khadilkar, editor of *Navakal* and an inveterate eclectic, who so far has been backing the Shiv Sena's Hindutva campaign, has turned around and is busy delivering broadsides against the state

government's rehousing scheme. His argument is that the Marathi inhabitants, comprising 25 per cent of the city's population, live in run-down, dilapidated chawls in south and central Bombay, for whom Bal Thackeray is offering no schemes. Most of the slum-dwellers are not the Marathi-backers of the Hindutva government but are migrants from other states. So you have a pro-Marathi pro-Hindutva government appeasing outsiders and Muslims (who it had promised to throw out), in preference to the local Marathi populace, mocks the sly Khadilkar

AUTHORITARIAN PROVISIONS

Chapter 22 of the recommendations provides that the consent of 70 per cent of the slum-dwellers on a particular plot for joining the scheme, as provided in the earlier SRD scheme, would stay. It, however, specifies that (unlike the earlier SRD scheme) the 30 per cent or less who oppose the scheme, would only have the choice of either compulsorily joining the majority, or facing eviction and transfer to some other undefined plot. The forcible

application of this scheme to a dissenting minority is bad enough. Worse still is the possibility of the use of muscle power to obtain the 70 per cent 'consent' that is statutorily required. This is likely to open the doors to the burgeoning real estate mafia in the city, which has not had much stake in the slum sector so far. Those who have taken note of the more-than-a-dozen killings of builders by rivals or unpaid financiers, would realise what is in store for the city's poor if the builder warlords are let in.

For instance, residents of Ganesh Moorthy Nagar, a slum in Cuffe Parade, south Bombay, who opposed a development scheme by a builder, found themselves 'kidnapped' and paraded before Raj Thackeray, nephew of the Sena supremo. They were told in ominous tones to withdraw their dissent. Currently, these slum-dwellers are busy with a civil suit, where they are seeking cancellation of their 'consent letters' as they were allegedly obtained by force and fraud. These kind of situations are going to multiply in the future.

Under the scheme, the police has been called upon to give 'pro-active support' to

Cameos in History and Culture

Looking for the Aryans

R S Sharma

Rs 50.00

The Aryan problem has been attracting fresh attention in academic, social and political arenas. This book identifies the main traits of Aryan culture and follows the spread of their cultural markers. Using the latest archaeological evidence and the earliest known Indo-European inscriptions on the social and economic features of Aryan society, the author throws fresh light on the current debate on whether or not the Aryans were the indigenous inhabitants of India.

Ancient Mesopotamian Literature

K Chaitanya

Rs 50.00

This forms part of the history of world literature compiled by Krishna Chaitanya following his researches of over two decades. This book outlines the Mesopotamian literature, and also the cultural and historical background of the Mesopotamian people, so that their literary tradition may be seen in perspective.

Orient Longman

Orient Longman Limited, 3-6-272 Himayatnagar, Hyderabad 500 029

the projects under the scheme, and play a direct role in suppressing dissenters (Chapter 17). Deputy Commissioners of Police will be designated as 'nodal agencies' for their zone to ensure there is no resistance to the projects. This will mean greater scope for harassment and intimidation by builders using the police machinery. Interestingly, at the stage of formulation of the scheme, the top brass of the city police opposed any statutory involvement pleading that law and order should not be mixed up with supervising civil projects. The chief minister, it is understood, overruled these objections.

A trailer of what is in store was seen recently in Shivaji Nagar and Harinagar, two adjacent slums situated in Bombay's communally sensitive Jogeshwari (east) area. Akroti Nirman Builders had been granted permission by the BMC to develop these two slums composed of about 800 huts in 1994. There were, however, allegations that the builder did not have the requisite 70 per cent 'consent', and many had been forced or misled into giving their signatures. The BMC's slum department *prima facie* saw merit in these allegations, and ordered a review of the permission granted as well as a fresh survey of the residents' opinion. As all this was going on, the builder's men, with help of a private demolition squad, demolished several tenements to make way for fresh construction. The demolition was made possible by the protection provided by the Meghwadi police station to the demolition gang, under orders of the deputy commissioner of police. Bipin Bihari and with the blessings of the local Shiv Sena MLA, Sitaram Dalvi. The BMC has denied it had any hand in the demolition. Nor was there any BMC or Collectorate official present on site at the time of demolition. Had it not been for the strong protests of the local residents, and the intervention of the police commissioner, Satish Sahney, to whose notice these illegal police acts were brought by Nivara Hakk Samiti and other groups, the private demolitions would have continued.

To make resistance more difficult, the scheme proposes extensive amendments to the Maharashtra Regional and Town Planning Act, 1966, the BMC Act as well as the Maharashtra Slums Areas Act, 1971 *vide* Chapter 13. These amendments seek to restrict the scope of slum-dwellers or their organisations appealing to the courts of law, or seeking injunctions against the implementation of projects under the scheme.

More worrisome than the legal sabre-rattling is the near-fascist language that has accompanied the Afzalpurkar report. Though not stated directly in the report there are provisions which hint at controlling entry of migrants into the city. D K Afzalpurkar, chairman of the

committee, at a Nivara Hakk seminar, actually spoke of compelling new migrants to report to camping grounds outside the city limits before according entry rights. This could lead to monitoring of the Muslim minority, and evictions could take place in the name of removing Bangladeshis, as has been threatened by Bal Thackeray. Soon after being installed, the SS-BJP government in fact made an abortive attempt to introduce the permit system in the city.

At the inauguration of the scheme on October 3, Bal Thackeray was vituperative. He threatened demolitions of new slums, he promised jail sentences to those members of the city's poor who dared to build fresh huts, and he railed against officials who allowed new migrants into the city.

HIDDEN INCENTIVES FOR BUILDERS

In posing to support co-operative development by slum-dwellers, the Afzalpurkar report has a chapter (Chapter 16) on incentives for co-operatives. If the developer is a co-operative society, one of the incentives offered is sanction for sale of 25 per cent of the 'free-sale' commercial component before the rehabilitation housing is constructed. Knowing how builders masquerade as co-operative housing societies, it may not be difficult for builders to obtain this concession, sell off the commercial units, grab the proceeds, and make off leaving the slum-dwellers high and dry.

The report also recommends giving builders the benefit of transferring their right of commercial development accruing on slum pockets to some other site through the grant of Transferable Development Rights (TDR) certificates (Chapter 15). Creating this form of commercial paper will open up a lucrative trade in TDRs as well as allow builders to mint money in posh areas by using slum development as an excuse.

On the other hand, there are serious disincentives which would prevent slum-dwellers from opting for any other path of self-improvement save the builder-oriented one laid down in the report. Chapter 29 of the report provides that all other slum improvement programmes will be phased out thus limiting the options for slums to decide their development. Already sanction for 20,000 slum toilets, approved earlier by the BMC, has been held up by the state government on the specious plea that it is a waste of money since the new housing scheme will provide toilets and much more.

POSSIBLE ALTERNATIVE

It is obvious that the ultimate solution to overcrowding and expensive housing is to ensure that the socio-economic

compulsions that force mass migration towards cities are ended. However, within the parameters of the system, housing rights and environmental groups have been urging a more rational and people-oriented path of slum development.

The biggest hurdle to people improving their environment in slums is the lack of land tenure. Even photo-pass holders living in slums censused in 1976 pay a 'fine' and not a 'rent' for their 'illegal encroachment', and can, and have been, evicted to make way for supposedly essential public projects. This Damocles sword of demolition and eviction prevents slum-dwellers from investing in the development of their environment. Granted ownership or lease tenure of their land, slum-dwellers are bound to undertake a creative, and environment-friendly path of development. Such grandiose schemes, like the Afzalpurkar scheme, are an expression of faithfulness in the creative power of the poor to manage their own affairs.

Besides land tenure, the state government must also be compelled to make cheap finance available to slum co-operatives. Banks and lending institutions must apportion a sizeable part of their funds for co-operatives slum housing projects; and the only security that should be demanded is the mortgage of the slum houses under construction or renovation. Furthermore, sanctioned slum co-operative housing projects can be provided primary construction items like steel, cement and bricks at subsidised rates, like rations through a well-monitored public distribution system.

Architecturally, the cheapest and most environment-friendly model would be the Ground + one or Ground + two, if necessary. The 'horizontal approach' rather than multi-storey constructions would be most in keeping with the environment slum-dwellers are used to in close neighbourhood; and at the same time it would avoid the high construction and maintenance costs that high-rise buildings involve.

Moreover, the government cannot be allowed to side-step its social responsibility in crucial areas touching the people's livelihood. The Afzalpurkar report is nothing short of 'The Great Escape' for the government. Development of infrastructure facilities and services as well as site development must be undertaken by the government. A special authority needs to be set up responsible for developing the site and services required for slums, while giving the actual right of deciding development to the slum-dwellers themselves.

Finally, it must be granted that one big service the Afzalpurkar report has done to the slum-dwellers is the extension of eligibility of slums to January 1995. Slums facing demolition and eviction can now at least grab this proviso in their struggle for existence.

Politics as Property

K Balagopal

The social urge represented by the toppling of N T Rama Rao demands economic and industrial modernisation and development. And for that it demands efficient and quick-acting governance of the type that has made men like Pratap Singh Kairon and Sharad Pawar famous. It is here that NTR is perceived by a substantial segment of Andhra Pradesh's elite as having failed.

ALL political happenings are not significant events. Whether the toppling of N T Rama Rao in his ripe old age by a cotene directed by his own sons-in-law and abetted by his own sons is an event of any significance is a point that needs discussion. It can no doubt be said that it happened at a time when the man least deserved it – which is not saying much, for he has at every point of time abundantly deserved it – and for a reason that carries no great conviction with the people at large. His dear wife was said to have been an 'extra-constitutional centre of authority', which means little because all authority in the Indian polity is in any case extra-constitutional, even when it derives formal sanction from the Constitution. More to the point, the old man's son Hari Krishna, who was a catalyst in the turbulence and has now become minister for transport in the son-in-law's cabinet, is as much an extra-constitutional centre of authority as his much-maligned stepmother, inasmuch as he too has presumed to dictate the shape of political happenings in the state without ever having been elected to the assembly by or in the name of the people, an act of anointment that is evidently accepted by common consent as a good enough entitlement for toppling, subverting or hijacking governments.

A Hindu coparcenary being what it is, all property disputes among Hindu families carry an element of high drama. And castes such as the Kammās who are substantially propertied have a community culture in which this drama is an understood and well elaborated element. The early Telugu films, for instance, were in large measure nothing but the enactment of this familiar drama of peasant proprietor or landlord families on the screen, and NTR has acted in quite a few of them. In most such films the dramatic denouement begins with the aging of the patriarch, and is not uncommonly precipitated by his late infatuation with a young wife, a foster child or some such aberration that the heirs regard as senile delinquency. That by that time the patriarch, whatever his past acts of despotic authority, is usually a mellowed man, a silver haired specimen of contrition, or at least of a certain

desire to make up with all and sundry – including the naxalites, in NTR's case – before quitting this world, generates a certain sneaking sympathy for him in the onlookers. And the heirs look even more villainous than they need to.

It was this drama of painful generational change in the property holdings of a Hindu joint family that Andhra Pradesh witnessed in the last couple of months. But what made it weird was that the property that the family was fighting over was the state of Andhra Pradesh, its people, politics and wealth. This itself, perhaps, is its significance, for Andhra Pradesh is a state that prides itself on its radical history; it can justly boast of a significant political element that is radically critical of the existing and inherited order of things. That radical critique can also fairly claim that it has influenced people's perceptions and ways of looking at things in major measure. And yet the inadequacy of this history is such that a single family – no doubt a rather big and glamorous one – can fight over the state as its joint property, the way such families have fought over home and hearth for centuries in the feudal-patriarchal tradition. And the people at large, including the more politically sensitive among them, are not only not outraged but find it quite amusing; or else, what is even worse, dismiss it as an irrelevant interlude in the grand progress of history.

But it is possible, perhaps, to seek other points of significance as well. Indeed, one can even 'rationalise' the events to reveal a hidden meaning, a rational order disguised by maverick accidents, an analytical practice that radical – especially much of Marxist – thinking has always been prone to. For instance, one may see in the rise and the crisis of the Telugu Desam Party the birth-pangs of a self-conscious regional bourgeoisie, its strategies of consolidation and their crises. Such rationalisation is one of the most fascinating things about radical critiques, and contributes a lot to their enduring attraction notwithstanding repeated practical and predictive failures; but the fascination is in truth a distraction. Such a

mode of analysis is faulty because what filtered out in this process, and (to me metaphors) thrown out like the peeled skin of a fruit is thereby surreptitiously rendered irrelevant and insignificant. It is usually not a point that becomes unpleasantly evident when what is peeled off analytically to reveal the alleged rational core returns later – a real and not analytical time – to stick again to the fruit.

Let us try then to seek a significance of recent events in AP in as non-rationalising a way as possible. It is one thing to recognise order and causation where it exists, and to recognise human subjectivity in history; but quite another thing to seek the working out of a neat pattern of Reason acted out by social collectivities set up as historical subjects. All such thinking leads to overt or covert reification of history, which in turn leads to utopian prescriptions for putting an end to such history. And all utopias are anti-human, even the most humane of them. The human subject – both as an individual and as a collective – is too small to bear the heavy weight of utopias. It can only be crushed by them. A non-utopian radicalism requires a non-rationalising mode of analysis, a mode of seeking truth, for truth must necessarily be sought, that will accept reason but will reject Reason, and will be adequately cautious in identifying patterns of orderliness and causation in history, keeping always in mind that the history is *human* and therefore always carries with it a large quantity of contingency, in every sense of that term. finiteness, disharmony, incongruence, accident, whimsicality and so on.

The birth of the Telugu Desam Party 15 years ago was the political consequence of at least two phenomena. One is the dissatisfaction felt by a certain section of Andhra's regional elite with the Congress Party's strategies in dealing with their aspirations for political power in the state and regions. Those sections of the regional landed-financial-commercial elite that possessed the advantage of substantial property, and cohesive homogeneity as well as a standing of social leadership within the caste system – such as the rich among the Kammās of coastal Andhra Pradesh – felt that they deserved more political power than the Congress was prepared to give them. The unwillingness of the Congress was due to many factors, which may not be susceptible to an ordering in terms of historical significance or decisiveness. One was the negative factor that the Congress Party, with its unitary vision of India, did not like strong and self-assertive elites to develop in the states, which in its language would lead to 'fissiparous tendencies'. There were, however, less negative reasons too. There was a felt need to accommodate the aspirations of backward regions and socially weak

communities in the states by allowing their representatives, real or putative, to occupy positions of power. This meant that the most powerful regional elites would be to some extent sidelined, or at least forced to share power and glory with the less deserving. But this positive factor contained within it another negative factor, which has been emphasised by Ambedkarite analysts. This was that the Congress, especially at the level of national politics, was dominated by brahmins, whereas the upcoming regional rich were from sudra communities, which was one reason why the Congress expressed a preference for a unitary structure of the polity, and encouraged the less dynamic of the sudra communities, or those from backward and undeveloped regions within the states. This process was also congruent with the sociological fact that in the backward and undeveloped regions, the unity between the brahmin and sudra elites as the principal exploiting groups of pre-modern India has not been fully shattered, whereas in the developed regions, that unity had been breached even by 1947, for both economic and political-cultural reasons. In Andhra Pradesh Congress politics, for instance, the brahmin leadership has had a more or less cosy relation with the Reddy landlords of Rayalaseema and Telangana, whereas in coastal Andhra the Kamma community's rise, in social and political terms, took place in an anti-brahmin ambience, represented explicitly by non-brahmin self-respect type of movements, and implicitly by the rationalist, atheist and communist movements. It was this Kamma community that developed a very able and talented middle class and a powerful entrepreneurial elite taking advantage of the positive material conditions prevalent in the region watered by the Krishna and Godavari rivers, which conditions became even better after the green revolution. And yet, the rise to political power of this elite commensurate with its tremendous dynamism was blocked by Congress strategies.

While the resentment against this denial was one powerful mood behind the formation of the Telugu Desam Party, there was another whose contours have become clearer now than they were at that time. Whatever may have been true in 1947, by the 1980s, all the states of India, considered as ethnic-linguistic regions, had developed an elite quite capable of taking charge of the affairs of the region. Today, there is little doubt that they can fully take command of their regions and rule them as ably as Delhi is able to rule India. A person like Chandra Babu Naidu, the latest chief minister of AP, is equal to anybody in Delhi, whether in running an efficient administration, amassing unlawful wealth or cutting his opponents' throats. He and his class do not need to be overseen by Delhi in doing their job. They have nothing

left to learn – in administration, commerce or criminality – from Delhi. India is today certainly ripe for federalisation, for this if for no nobler reason. And if a morally desirable end is actually realised through not so noble pressures, then that would not be the first time it has happened in human history, nor is it going to be the last time.

This pressure of impatience felt by well grown regional elites has been expressed in political language in the idiom of decentralisation, autonomy, federalism, etc. If it is true that these expressions are not to be taken literally as the actual aspirations of all those who talk in terms of them, then it is also true that they are not to be understood as mere ideology, in the sense of either a distorted representation of reality or, worse still, a camouflage for hidden material interests. The notions are just what they are: the values in terms of which actual aspirations are conceived, thought of and explained, following the general principle that in human thought every particular idea or aspiration is conceived of and expressed in terms of universal values, in other words that the cognitive and the normative are inseparable in human thought, for human beings cannot make sense of their existence without making moral sense of it. Ideological camouflage is not ruled out here, but that is no more the essence of the matter than the naive equation of values with actual aspirations. What is involved here is a structural property of human thought, which naturally operates in a social context.

Once such a universal value comes into existence it is capable of being taken up and given fresh content in other aspirations; of being attached to or reinterpreted in other contexts so as to give rise to new aspirations, and energise hitherto dormant political practices; of becoming part of social culture that shapes human potential into actual behaviour patterns; and thence also of realising itself in social institutions, social relations and social practices beyond the intentions and aims of those in whose aspirations it originally found normative expression. The notion of ideology, even when we grant that 'it is capable of influencing material reality', is not sufficient to comprehend this important historical process. This is not to say that the notion is entirely useless, provided it is used within the limited space of its utility.

The emergence of self-sufficient elite with the slogan of federation is frequently interpreted in terms of the rise of sub-nationalism or regional nationalism. Whether the interpretation is valid in a given case depends upon the details of that case, and the underlying rationalisation that ethnic upsurge is some sort of a law of the contemporary third world, must be viewed with suspicion. As far as Andhra Pradesh is concerned, there has been no rise of

'nationalist' feeling parallel with the change that we have been describing, for there is in general no strong feeling of 'Telugu-ness' comparable with what one finds among the Tamils and the Bengalis (not to mention the Kashmiris).

But whether or not an emergent regional nationalism has coincided in all regions of the country with the rise of self-assertive elites, there is one other change which has taken place. This is an urge that goes beyond the ruling class of the region and well into the middle class, to create a fully-fledged modern community, a well rounded civil and political society in the regions, by structuring the necessary institutions, conventions and norms. One may call this a process of the nation in the making, if there were a nation in the making. It cannot be assumed to be there, merely because this urge is there. But even without the self-conscious notion of a 'nation' (with all the implied desires of a distinct destiny and identity), there can be an emergent desire for a coherently structured modern society with functioning institutions and respectable norms of public life, which is both desirable in itself (and actually desired by many in the developing community) and a precondition for the legitimacy of the governance of the region's elite. The unitary character of the Indian state, coupled with its gradual criminalisation has left much to be desired in this matter. A strong desire to set this right and to shape a full-fledged modern society in which every conscious member of the community may take pride, and over which the regional elite may legitimately rule, is a strongly felt idea that comes through very vocally in the regional press, academic writings and literature. In Andhra Pradesh, its strongest and most self-conscious representative has been the daily newspaper *Eenadu*, which silently prided itself on having brought N T Rama Rao to power in the first instance for this very end, and which is now no longer even very silent in claiming credit for having forced his replacement by his son-in-law, again to the same end.

Eenadu has not merely reported, but has taken a political stand while reporting all major public issues concerning Andhra Pradesh in recent years. Here are two instances where its purpose coincided with larger democratic aspirations. The paper, over the last two years, has made it impossible for any government ruling the state to continue the familiar Indian liquor policy of making people drink more and more so that the government may balance its budget. The paper has also done much to put the searchlight on warlord violence in the Rayalaseema districts, and create a reaction of disgust in the ordinary reader. The plaint of the warlord politicians of Rayalaseema that their region's profile has been

deliberately maligned by a coastal Andhra Pradesh testifies to its success in creating revulsion.

Both these campaigns no doubt hurt the Congress, and can easily be interpreted as part of that paper's anti-Congress politics, as they frequently are. But going beyond that, both these campaigns have contributed to a certain cleansing of public life in the state, which made them attractive to the public at large, and contributed to the regional elite's aspiration for a self-respecting civil and political society for it to rule over. NTR was not slow in picking up the cue. He was not very consistent in the matter of the political violence of Rayalaseema, for that violence has always been loyal only to power and not to any party, and NTR was not above the temptation of co-opting it instead of vanquishing it. In any case, for politicians of the present generation, the Cuddapah and Kurnool model of democracy through bombs and guns offers a tempting alternative to the tedious business of cajoling an increasingly cynical electorate. But on liquor, NTR did not hesitate beyond the first couple of weeks. He loudly set himself up as the saviour of the agitating women.

However, the social urge represented by *Eenadu's* politics goes beyond this. It demands economic and industrial modernisation and development. And for that it demands efficient and quick acting governance of the type that has made men like Pratap Singh Kairon and Sharad Pawar famous. It has heard of the Bombay-Ahmedabad industrial corridor and the throbbing entrepreneurial life of Punjab. The no-nonsense administrative efficiency that would appeal to local, national and multi-national capital, and encourage them to transform Andhra Pradesh in like image, is a much prized thing in this view, which has acquired greater force and self-confidence in the era of Manmohan Singh. This requires, among other things, a certain mood of purposeful governance, quick decision-making, and political balance. It is here that NTR is perceived, by *Eenadu* and the substantial segment of AP's elite that is like-minded with it, as having failed. This dissatisfaction of theirs has been evident from the beginning of his political career. Like all people driven by purposeful rationality, these men were upset by the whimsicality of NTR who is on a perpetual honeymoon with his own godliness. But they put up with him until he went and got himself a wife to whose ambition he was willing to sacrifice even the stability of the party and government. The TDP has over the years struck a balance between the unquestioned charisma of its undisputed leader, and the organisational grip of the elder of his two politically active sons-in-law. Within the terms set by this balance the

second rank leaders learnt to locate themselves, assess each other's standing and evaluate their respective chances of climbing up the ladder. This knowledge and the certainty that went with it made for whatever stability the TDP had, and it was this that was upset by Lakshmi Parvati, NTR's second wife. A woman as greedy, as intelligent, as able and as ambitious as Chandra Babu Naidu (and there was no third person in the party that could match either of them), she not only gave the son-in-law the jitters, but completely upset the structure of opportunities that everybody in the party understood and related themselves to, in her effort, as a late-coming aspirant for the successorship, to create a base for herself in the party. Naturally, the least valued men in the party gathered around her and entered the mansion of power 'through the kitchen' as Telugu papers contemptuously said. It is an interesting sidelight that she literally made the kitchen her headquarters. Indeed, the whole of Lakshmi Parvati's strategy has been built around symbols of wifeliness – the caring, cooking consort – which were meant to create acceptability for her politics by pretending to be what she was certainly not: a mere wife. But such is the unhappy lot of precocious individuals who wish, for good or for bad, to grow out of socially given roles without questioning the roles and the attendant expectations.

The expectations, reinforced by a particularly vicious press led by *Eenadu*, helped Chandra Babu Naidu and the jittery partymen who had gathered under his umbrella, frightened by the sudden shaking of the familiar earth beneath their feet. 1995 has been a year of elections in Andhra Pradesh. After the assembly elections, the entire electoral process for the three-tier panchayat raj, the municipalities and the co-operative societies was gone through with. At each step, the TDP was shaken by conflicts over allotment of tickets, with Lakshmi Parvati patronising candidates of her choice, who were mainly men who would otherwise not have stood much chance of breaking through the established party network to get tickets for themselves. At the end, when all the elections were over, the party had come close to an irremediable division. It only required the coming together of the two discordant sons-in-law, blessed by a disloyal son, Hari Krishna, and as soon as that unity was cemented, the legislature party split, and NTR was dethroned. He made an ass of himself by parking his favourite campaign van outside the hotel where the disloyal legislators were camping and inciting the policemen present – who had by that time guessed which way the wind blew – to drag the dissidents from out of the hotel and hand them over to his lawful custody, such being his notion of lawfulness. He later made a further ass of himself by demanding that

the office of governor must be abolished – though Krishna Kant had followed the procedure quite scrupulously – and that chief ministers must hereafter be elected directly like the president of the US so that they may be undisturbed in their whimsicality for five full years.

Throughout this terminal combat, *Eenadu* played a determined role by lampooning Lakshmi Parvati's ambition, as if she was the first ambitious politician this state has seen. It made copious use of the patriarchal distrust of an ambitious woman who gets married to a wealthy and powerful old man whose brain is suspected to have gone soft of late. This is the acme of vampishness in a woman, and Lakshmi Parvati was guilty of this. Nothing more was needed for a determined campaigner to damn her.

The ruthless campaign is matched by the man it has brought to power. Chandra Babu Naidu is a cut-throat politician of current vintage. He is also ably suited for the role that *Eenadu* and the opinion it represents hope he will play. Like any man who was born in a four-acres-of-dry-land peasant family from backward Rayalaseema and has made for himself umpteen crores by the time he is 40, he is abundantly endowed with what capitalism calls enterprise. But going beyond making money for himself and his cronies, he claims the vision necessary to structure a modern capitalist society endowed with the characteristics required to reproduce itself as a matter of course. This, as we have said, is one vision that underlay the rise of the Telugu Desam Party. There is no inevitability of its success, and no ruse of Reason that will work for its success. All that we can say is that for the present it has the national and international climate in its favour, apart from whatever internal dynamism it has. But then that climate itself contains much that may ultimately disfavour or distort it to suit a different purpose. And the internal dynamism operates in a specifically third world environment.

But Andhra politics has always provided space for other visions, other values that can inform the process of the formation of a modern society. These are values of equality, justice and welfare. Whether these values are realisable in the absolute sense or not, they can function as a counterpoint to the kind of vision that *Eenadu* and Chandra Banu Naidu desire, and can drastically modify the outcome of the ongoing process of social transformation. It would have helped if the proponents of the alternative values understood the radical social model they visualise as a counterpoint in ideals rather than the next phase of an ordered History. But then it is an aspect of unavoidable human contingency that we have to put up with radical baggage of the past as much as with the conservative muck.

New Attempt at Workers' Resistance

National Centre for Labour

Mohan Mani

National Centre for Labour has emerged as a co-ordinated response of the working class to their growing marginalisation due to the new economic policy.

It was the best of times, it was the worst of times...

— Charles Dickens, *A Tale of Two Cities*

IT certainly is the best of times for a small minority of the population in this country — for the industrial bourgeoisie with their freedom for unlicensed growth, unfettered by any obligations to the workers or the environment; for the large farmers with their access to new technologies, new crops and new markets; for the new breed of professionals, particularly those in the fast expanding multinational sector, with monthly salaries amounting to what a construction worker can hope to earn in five years. And in their wake, for a whole, distinct upper middle and middle class segment of the population, prosperity has become the sole objective and guiding principle of the new economic policy (NEP).

While times have never been so bad for a growing section of the population pushed into increasing poverty. The industrial workers faced with loss of jobs, with no protection from the government, and increasingly pushed into casual employment. The large number of workers in the different unorganised sectors of industry — agricultural, plantation and forest workers, construction workers, fish workers, petty self-employed workers, etc., for whom real wages have been rapidly pushed down, particularly by the price rise in commodities that are essential to their needs. These are the sections affected by the reduced government spending on social security schemes — on health, education, subsidised commodities through PDS, etc — a cardinal principle of the NEP. They are the sections who will be further excluded from any real opportunities for higher education, as its cost soar to Rs 20,000 per year. They constitute a large majority of the population of the country. Theirs is the burden of propping up the arithmetic and balancing the books of the NEP. Theirs is the lot to face increased state oppression to quell any opposition to the government policies.

People have resisted this process of marginalisation. They have resisted in the only spontaneous way known to them — by voting out the NEP in the recent state assembly elections. So much so that the prime minister had to admit that NEP is

generally perceived as pro-rich, and had to exhort his party colleagues to 'educate the poor that the government policies have actually benefited them'! But then what have the people gained? A Janata Dal government in Karnataka or a Telegu Desam government in Andhra Pradesh or a BJP government in Gujarat — all adhering to the same policies as the Congress party. Even the West Bengal government, the last stronghold of the communist parties had had to toe the Congress line on economic development.

A change in this dominant political ideology can only be brought about by the people through an organised, educated resistance. The initiative for this should have come from existing organisations of the working people — the national trade union federations. However, these bodies have themselves been unable to take a strong, positive stand in this regard. Their responses have been confused. Faced with the dictates of the political parties to which they bear affiliation, and given their own long process of economism and depoliticisation, the trade unions have found themselves unable to articulate a clear, political stand against the anti-worker policies of the government. They have floundered along with occasional token strikes and dharnas, but have failed to mobilise the mass of working people and form a common front to resist the government. It is significant in this context that two of the large trade union federations, the AITUC and the INTUC have taken some initiative to delink themselves from their parent political organisations, and there have also been some attempts at unification and greater co-operation between the AITUC and CITU. However, to date all these attempts remain a part of the confused response of the trade union organisations to the NEP. It is against these circumstances that the formation of a new trade union federation, the National Centre for Labour (NCL), as a representative body of organisations working in the unorganised sector of labour should be viewed.

The formation of NCL has not been a sudden spontaneous coming together of organisations to face a crisis. On the contrary, it has been the result of a carefully thought out process, which has gone on for over four

years and involved a number of meetings and discussions. It has been a response to the felt needs of various organisations working in conditions of bitter struggle for over a decade with various diverse groups of workers, to form a common federation with a minimum common set of demands, and to promote greater solidarity in their struggles. It has tried to address itself to the various problems of non-permanent workers, and of organisations working with them. It has also been, finally, a response to the current changed political and economic situation in the country, and to the rapid process of marginalisation faced by these sections of workers. NCL now includes unions representing as diverse group of workers such as forest workers in UP, agricultural workers in Andhra Pradesh, construction workers in Tamil Nadu, Karnataka and Kerala, fish workers in all the coastal states, self-employed women workers from Gujarat, UP and MP, anganwadi workers in Maharashtra and many others. These unions together represent nearly 6 lakh workers from all over the country. It is a truly diverse and representative body of different unorganised sectors of labour in this country. It speaks for the efforts put in by the representatives of the different unions that they were able to formulate a clear-cut constitution for NCL, accommodating the diverse needs of the workers in these sectors. The culmination of this process of planning and discussions was the Founding Convention of NCL held on May 28 and 29, 1995 at Bangalore.

The two-day founding convention of NCL commenced with an inaugural session held at the Town Hall at Bangalore. The session was attended by the delegates of the various constituent unions to NCL. The inaugural address was given by the veteran labour leader, Ela Bhat of SEWA, who also unfurled the flag of NCL. This flag with green, blue and yellow bands adjacent to a broad band of red, symbolises the unity of agricultural and forest workers (green), fishworkers, women, dalits and minority groups (blue) and construction workers (yellow) with all the toiling masses of the country and the world (red). It symbolises the hope that such a principled unity of different sections of the most oppressed and marginalised workers will be able to wrest the initiative from the present political establishment, and to force a rethinking on the development imperatives of the country. It symbolises the essence of the political process that NCL hopes to catalyse.

It was gratifying that the inaugural session was also addressed by the state president of AITUC, and fraternal greeting to NCL on its formation were received from the state unit of HMKP. At this juncture all working class organisations need to strive for greater and principled issue-based unity, and this is

precisely what NCL hopes to achieve in all its dealings with other trade unions.

The inaugural session was followed by the working sessions of the delegates. At the first session the constitution of NCL was read out, discussed and unanimously adopted. The resolutions to be adopted were proposed by the various constituent unions and discussed before finalisation. The major resolution included: (i) The demand to recognise the absence of a permanent and stable employer-employee relationship for most workers in the unorganised sector, and hence for the government to step in and act as a guarantee of the rights of these workers, and to form tripartite boards to regulate conditions of employment in these sectors; (ii) The demand for solidarity and support to the ongoing struggles of the workers in the unorganised sectors and marginalised sections of society; and in particular to the struggle of construction workers for a comprehensive legislation to protect rights, the struggle of fishworkers for control over their environment and source of livelihood; and the fight of the self-employed women for the adoption of an ILO convention on their rights; (iii) The demand for a minimum national wage across all sections of workers, and minimum benefits of health insurance, gratuity and PF, maternity benefits, etc. for all workers to ensure a dignified existence; (iv) The demand for control over the environment and resources of sectors like fishworkers, forest workers and agricultural workers, who are faced with the threat of encroachment from big business and alienation from their source of livelihood.

The last working session was to elect the office bearers to the executive committee and the committee of secretaries of NCL. It would be appropriate to highlight here some of the significant aspects of the election process as specified in the constitution of NCL: (a) Since nearly half the workers in the unorganised sector are women, the constitution specifies representation of women in all decision-making bodies of NCL in proportion to their membership strength; (b) The committee of secretaries, the apex decision-making body, shall function as a non-hierarchical committee, with no general secretary or president to head the body; (c) While following the principle of proportional representation to all decision-making bodies, it shall be ensured that sections of workers who are under-represented in NCL shall also be ensured a voice through co-operation of representatives from these sections to the various decision-making bodies; and (d) The constitution grants the right to each member organisation to recall any of their delegates from positions of office in NCL.

Accordingly, 40 office bearers to the executive committee and nine secretaries

were selected by the delegates. It is significant that women had nearly 50 per cent representation in the executive committee, and four of the nine secretaries were women.

On May 29, 1995 a massive rally of workers was organised by NCL at Cubban Park in Bangalore. Nearly 50,000 workers attended the rally. They were addressed by the trade union representatives of the constituent organisations. All had come at their own expenses, forgoing their wages for the day. They were not provided any incentive or free transport facilities to come to the rally. It was a turnout which even established political parties would have found difficult to mobilise with their political clout and monetary incentives. The workers came to express their solidarity with the decision to form NCL to represent their interests.

It is significant that the founding convention of NCL attracted wide publicity and media coverage. Most important English and vernacular dailies and magazines across the country carried write-ups on NCL. The formation of NCL has raised considerable expectation among different sections of the society, in particular among the working people. It is up to NCL now to live up to these expectations. The organisation has already initiated different activities around the following priority areas: (i) Building solidarity between different working class struggles in the country. This solidarity should transcend just token support, and should be based on a full understanding of the issues involved in broader social, economic and political context. The process should lead to a shared ideological perspective among the members of NCL; (ii) Research and documentation of the particular situation of work, livelihood and struggles of different sections of the working class, with an aim towards education and information sharing. This should also help in forming a shared ideological perspective, and (iii) Lobbying and interaction with other agencies, including the government and its regulatory and policy-making bodies, the international regulatory agencies, trade unions, media, etc. in order to push for acceptance of the common minimum demands of the workers and the justness of their struggles.

Some of the actual activities initiated by the various constituent members of NCL in this regard include: (a) In UP the union representing forest workers in the Saharanpur region is now attempting to make common cause and forge links with unemployed industrial workers in Kanpur and other important urban industrial centres; (b) SEWA has been at the forefront of the successful struggle to get a proposal for an ILO convention of self-employed women to be adopted. It had to carry its struggle in the face of apathy, and even opposition from the

Indian government which abstained from voting on this convention; (c) The National Fishworkers' Forum (NFF) is intensifying its struggle for the rights of the fishermen for control over their livelihood, through a blockade of the harbours in different parts of the coast during November. This shall be an occasion for NCL to organise massive protest rallies in solidarity. The federation is taking up this issue for education and publicity among its members; (d) The Tamil Nadu Construction Workers Union (TMKTS) while taking steps to intensify its struggle for proper implementation for a tripartite board in Tamil Nadu, is also attempting to make this struggle an occasion for wider solidarity with other sections of unorganised workers in the state; and (e) NCL has initiated a comprehensive study into the minimum wages paid to workers in different sectors across the country.

All these are small but significant strategic steps in forging a new type of workers' movement and working class consciousness. It is fortuitous that the formation of NCL and its initial activities are happening at a time when the country is going through a period of political ferment, and is preparing itself for what must be a significant election in its history. It remains to be seen if the organisation will be successful in carrying on the momentum generated and fulfil the expectations raised by its formation. What cannot be questioned is the pressing need for such organisational activity to change the course of political history of the country.

Cuba: The Renewal

Frederic F Clairmont

While Cuba repudiates laissez-faire as the way to national reconstruction, in what is now officially celebrated as 'the special period' there is a radical break from the inflexibility of an earlier brand of socialism by vastly extending the scope of the market that functions within the framework of a comprehensive national plan. And the sweeping internal changes which are transforming Cuba are taking place at a time when, US machinations notwithstanding, the country's long isolation is clearly coming to an end.

FOR those peddlers of salvation who tirelessly preach the gospel of *laissez-faire* as the Grand Panacea for humanity's ills, the cataclysmic repercussions of the IMF/WB policies of structural adjustments in the third world are an apocalyptic reminder of the workings of Big Capital. As in China, and all of the Asian Tigers, Cuba repudiates *laissez-faire* as a pointer to national reconstruction. In what is now officially celebrated as 'the special period', the new directions radically break from the inflexibility of an earlier brand of socialism by vastly extending the scope of the market that functions within the framework of a comprehensive national plan.

Of one thing we can be sure: there are no ritualistic incantations that can be invoked by Cuba's decision-makers to cover up blatant managerial incompetence and woefully inadequate financial controls. In this respect alone, the rupture with the Soviet model was a benediction. One Cuban social worker, an atheist, called it a source of redemption, the need for national renewal. All the cobwebs have not been swept but the renewal is tangible. This implies junking of all dogmas and a no-holes-barred critique of all institutions and individuals.

In general, one does not find a sense of resignation and despair in Cuba. It could well be as a Swedish diplomat puts it that perhaps in no other country in the world are issues of development and their reverberations debated on such a scale with such fervour. This was not always so. Given the gravity of the crisis the solutions mandatory to pull the nation out of its morass will therefore have to be found, within Cuba. In short, the model for sustained dynamism must be of Cuban provenance; a fact and a challenge that the Cuban leadership and the people themselves have come to understand.

CYCLICAL DEBACLE

Food, fuel and consumer goods shortages of every sort, transport bottlenecks, power blackouts, devalued real wages and deteriorated housing and public services are

some of the major afflictions battering the nation's economy. The GDP table, in constant 1981 prices, indicates the depth of the calamity that befell the nation since the crucial year, 1989, one of the most pivotal turning points in Cuba's grim 20th century history. GDP collapsed by more than 34 per cent in that interval, exacerbated by an implacable embargo. There are few countries in this century's history that have taken such a beating – considerably greater than the amplitude in the US Great Depression, 1929-32.

TABLE: GROSS DOMESTIC PRODUCT*
(1989-1994)

	Billions of Pesos	Index	Per Cent Change on Year Earlier
1989	19.6	100.0	+ 0.7
1990	19.0	97.0	- 2.9
1991	17.0	86.7	-10.7
1992	15.0	76.5	-11.6
1993	12.8	65.3	-14.9
1994	12.9	65.8	+ 0.7

Source: National Statistics Office

It is an indicator not only of precipitous descent, but also pinpoints that the battle for recovery, now boldly and imaginatively under way, will be hard and protracted. There are no illusions among most technocrats within the finance and planning ministries and among the Spanish and Canadian entrepreneurs, with whom I spoke. Without recourse to facile rhetoric, president Castro elucidated the magnitude of the traumas engendered by these misfortunes and the challenges they pose.

Our main objective is to preserve the revolution and the achievements of socialism. We have not renounced socialism as our common objective. Now we are introducing reforms to develop the country during the 'special period' because the socialist camp has disappeared. We have lost more than 70 per cent of our imports. We were left without credits, without capital, without technology and without markets.

No other country in the world would have been able to endure what we have endured. No other socialist country has been able to endure the collapse of the socialist camp or the loss of its imports in the midst of a blockade. No other country would have been able to endure such a situation without a system similar to ours because it would not have been able to guarantee an equitable distribution of resources (italics mine).¹

Due to the immensity of the job of social restructuring and the ineluctable polarisation that has sprouted, it of course remains to be seen if this 'equitable distribution of resources' will continue to prevail. Certainly, neither China nor Vietnam offer sanguine precedents.

MEDIATIC DETERMINISM

The nation's distress, of which the mass exodus of the *balseros* (rafters) in July/August 1994 was proof sufficient, fathered a wave of prognostications on Cuba's coming collapse. Predictably, *The New York Times* and *The Washington Post*, are in the vanguard. "Senor Castro is doomed and everybody knows it", moans Flora Lewis. "The real issue is how he will fall and what happens then".² Similarly, James Hoagland contends that Cuba is not simply another version of a Latin American dictatorship, "but a rotten little regime stranded by the Soviet collapse; one which lives on borrowed time".³

This has been the standard stuff of the world corporate media for over three decades; a genre of journalism engineered to the specifications of US geo-strategic objectives. How can US *apparatchiks* and their media sidekicks have the temerity to prattle on about introducing 'democracy' to Cuba in view of the mounting inequalities between social classes in the US economy? A top executive boss now makes 150 times more than a worker's average salary, up from 35 times in 1974. Further, how can a fetid US social order be held up as a paragon of democratic virtue in Cuba or anywhere else?

These two ideologically-loaded proclamations and similar thematic variations, set the parameters of a false debate. It seems rather incongruous to castigate Cuba as 'living on borrowed time' coming from a journalist whose nation's wobbly economy has lived parasitically for decades on the world's savings, bedeviled by an unstable national currency, hurried in deficits and indebted up to its ears with no possibility whatsoever of repayment to its creditors; blighted by a depraved money-driven communications media gone berserk by wave after wave of unending corporate aggrandisement.

The misperceptions of *The New York Times* and *The Washington Post* are understandable as propaganda, but they are important as a

"I do not want my house to be walled on all sides and my windows to be stuffed. I want the cultures of all the lands to be blown about my house as freely as possible. But I refuse to be blown off my feet by any of them."

-Mahatma Gandhi

**126th Birth Anniversary of Mahatma Gandhi
October 2, 1995**

devp 95/353

mirror to the futureless cliché-ridden platitudes that the US hegemonic caste has cherished for over three decades. What these determinists are shovelling into the minds of their readers is not that the regime is heading for the rocks, but rather that interventionism should be cranked up to hasten its end.

Collapse will lead presumably to their nostrum of 'democracy', determined by the criteria of corporate capital, and their political and media handlers. In Cuba, and elsewhere, US stratagems have never been geared to advance 'democracy', or even to combat 'communism', but spring from the insatiable appetite to promote, maintain and augment the power of US capitalists. This has invariably masked itself under the euphemisms of national security and national interests.

What is demanded is not Fidel Castro's exit and the pharisaical inauguration of 'human rights' but the demolition of the Cuban revolution and its quest for national identity, a yearning inseparable from the revolutionary upheavals leading up to 1958. "What happened in East Germany", extols a Miami emigre, "is the blueprint for Cuba tomorrow". This crass morsel of imbecility is self-hypnosis on a grand scale. The bounteously funded Cuban American National Foundation and its aging leadership, as any perfunctory dialogue with its devotees discloses, has lost touch with the sweeping currents within Cuba; and hence its credibility within the island is marginal, and grows more so with each receding generation.

DEMOCRACY FOR WHOM?

How can the US oligarchy contend to be a leading light of 'democracy' when the alpha and omega of its entire social, political and economic co-ordinates are drenched in the inexhaustible sewers of Big Money and unbounded skullduggery? Republicans and Democrats are in effect a single class party notwithstanding their savage recriminations and shadow boxing. They represent a totalitarian political muscle designed to buttress the power, profits and prestige of its mega capitalists. Like peas in a pod capital and its political companions are inextricably interrelated.

Where has the unchallenged US hegemonic caste, in its more than 150 years of belligerent intrusions into Latin America, supported 'democracy'? Mexico? Cuba? Chile? Nicaragua? Haiti? Brazil? Grenada? Panama? What's the point in continuing this painful enumeration? The criminal historical record speaks for itself. Annihilation of tens of thousands of innocent victims by US state terrorism in Latin America alone is one that rivals the SS performance. On that score the SS at least were honourable; they abhorred

democracy. In contrast, however, to SS exterminism of the lesser breeds, US political exterminism is galvanised in the name of 'democracy'.

In Guatemala alone more than 1,00,000 persons were massacred over the last 34 years — for reasons stemming directly and indirectly from US interventionism in 1954 and after. 'Democracy', 'human rights' and now recourse to the trivialised platitude of the 'international community' are the ideal smoke screens behind which capital moves and functions. But smoke screens do not alter the fundamentals of its rapacity

CONFRONTING THE CRISIS

Nothing more poignantly highlights Cuba's present distress than the anguished testimony of an elderly Scottish schoolmaster:

No one has to tell me what the achievements and negations of the Cuban revolution are. I have studied them since its birth. I taught for three years in Batista's Cuba. I applaud the creation of an equitable social order; I applaud the end of racial injustice; I applaud the health and educational systems that are by far the best in the Americas; the cleanliness of its cities; the absence of drugs and organised crime; and above all full employment even at appallingly low wages. Certainly I could continue but what saddens me now, like millions of others, no doubt, is the scarcity of basic staples, the decrepitude of many of its splendid buildings, the black markets and of course the rise of prostitution and other reprehensible activities.

Cuba is not merely a third world socialist economy but largely a monocultural plantation economy. "Cuba is sugar and sugar is Cuba" declared Jose Marti. Since the XVIth century, sugar has remained the bigger export earner, accounting for 90 per cent of total exports, as well as its Achilles heel. The 1994-95 sugar harvest at 3.3m tons is the lowest in 50 years. Three successive miserable sugar harvests have cost Cuba well over one billion dollars in lost revenues — in spite of the compensation of higher world prices.

These shortfalls are imputable to the critical shortages of fuel, fertilisers, pesticides and spare parts. But above all they stem from the dearth of financial credits, now forthcoming from Anglo-Dutch banks. Whether these infusions wedded to other more sophisticated marketing, stimulative and institutional packages will reverse declining production remains to be seen. There are grounds for optimism. Sugar is of strategic importance for the payment of imports; its performance also impacts on other farm export sectors, i.e. rum and molasses.

What the US agro-industrial TNCs demand is privatisation of the entire farm sector. Politically, this is inconceivable in Cuba, at

any rate for the moment. In terms of the economies of scale, breakup of the socialised units would be disastrous. What is required is an overhaul of the management and marketing practices of several, but by no means all, of these large farms. Cuba is not faced with any demographic pressure on its land resources. Rather a trait of Cuban agriculture is the underutilisation of its farm resources and inadequate marketing infrastructure.

The new direction pursued comprises joint ventures (i.e. Unilever), marketing decentralisation and bonuses linked to higher productivity. Steps taken to rationalise the sugar sector are inseparable from other measures designed to uplift the economy. "What strikes me when I read certain superficial reports on Cuba", comments a member of the Sugar Commission, "is the belief that we are twiddling our thumbs. The truth is that we have been reshaping every facet of Cuba's farm economy at a break-neck tempo". An excessive degree of prudence is one of the hallmarks of Cuban decision-making and continues to be. Such prudence is by no means incompatible with the alacrity of decision-making as Unilever consultants have discovered. And the sugar sector is not an exception.

One of the salient innovations of 'the special period' has been the deployment of the revolutionary armed forces (RAF) to boost farm output. This deployment of military power numbering 1,85,000 now produces about a third of the island's food supply. This mass drive has gone hand in hand with the setting up of 'farmers' markets', legalised on October 1, 1994. Since then their numbers (July 1995) increased to 250 and are expected to swell to 7-8 thousand by end 1997. Free market retailing has now become widespread as one perceives in all major cities and larger villages. They have contributed to the improvement in Cuba's food supplies. Further rationalisation and consolidation of the wholesale and retail network is mandatory. In this sense the 'farmers markets' are a stop-gap measure.

TOURISM: THE STRIDES

Tourism is the first sector to have been extensively opened up to foreign direct investment. Spain and Mexico are the spearheads, with the Spanish group Sol Melia carving out a dominant niche in hotel construction. Growth has been phenomenal in the last two years. If it continues its present trajectory tourism will overtake sugar as the leading sector, on the assumption of course that the latter continues to lag.

Tourism's earnings are expected to top \$1 bn in 1995; up from \$850 m in 1994. Its importance is that it already generates

a considerable demand for domestically produced farm goods and services. It is here that one also sees the conspicuous presence of the RAF. It is engaged in every aspect of tourism. One of its better known enterprises being the huge tourist agency the Gaviota (the sea gull). The RAFs activities embrace every aspect of tourism, including luxury hotels, hunting reserves, marinas, spas, a large taxicab fleet and airplane flights. Its activity extends also to a chain of department stores called the TRD Caribe (*tiendas de recaudacion de divisas*) in which transactions are made in foreign currencies.

Tourism is almost entirely dollar denominated certainly the base wage in the sector is paid in pesos but for many tourist employees the base wage is lavishly supplemented by tips in dollars, as yet untaxed. This is a cause of friction as it demarcates the privileged service labour aristocracy from the peso-denominated wage sectors. It explains the sectoral exodus from the ranks of highly skilled professionals. Dollars for that elite can be used for purchases on the free (higher priced) markets as well as selected dollar stores. To what extent undeclared earnings in the dollar-base service sectors can be subject to fiscal equity remains to be seen, although this and other tax adjustment correctives (including progressive income tax) are being hotly debated nationwide.

Prostitution, although not exclusively a byproduct of tourism, is not a large scale marketing venture. The possibility of Havana returning to the *bordellos de luxe* of the pre-1958 era appears highly improbable because of the structure of the Cuban economy and the prevailing residual Puritanism.

FOREIGN DIRECT INVESTMENT

Foreign investment is pouring into Cuba. There is little that the US blockade can do to stop it. The US blocked the World Bank, and the IMF from making loans thereby underlining the twins' subservience to the dictates of US policy. The ministry of finance gives an accumulated total of \$ 2.1 bn for FDI, but it is unclear whether these are funds actually disbursed rather than simply committed. However, as in Vietnam and China, these numbers tell us very little about investment flows since they are officially recorded data.

There is reason to believe that sizeable sums flow into Cuba that bypass the scrutiny of the US. Cuba has come increasingly to be regarded as a 'safe haven' by many Latin American and other investors. It is no paradox that the nation is visualised by some as a kind of Singapore which offers stable returns in a stable political milieu. Cuba has all the preconditions for attracting

foreign investors: an educated and disciplined labour force, political stability, a stable currency already freely convertible in that the dollar is legal tender; investment laws that are rigorous but permit the foreign investor to repatriate his profits.

In less than a decade Cuba can be expected to pull in about \$ 30 billion in FDI. Judged by current trends a sizeable segment of these inflows will emanate from Asia. Such high FDI levels can be anticipated to be supplemented by a GDP savings rate, of

about 25 per cent, or about the same order as that of 'the Tigers' today.

BUSINESS REALIGNMENT

A Canadian oilman puts it this way: "The US is losing out in every way. In the oil business Cuba is on the threshold of major breakthroughs. The geological finds are beyond dispute. In about three years at the most the country will not only become self-sufficient — its well on the way now — but

The Institute of Development Studies, Jaipur is proposing to recruit two faculty at the Associate Fellow (University Lecturer) level. Both these positions are initially for three years but are likely to continue. One of the faculty will be associated with the Women's Studies Group and the Education Group of the Institute. The person concerned should have preferably a Ph.D. Degree in Social Sciences, Humanities or Physical Science or published work of repute. Academic qualifications may be relaxed in case of persons having relevant field level experience in Women's Studies and or Education. The second faculty will be associated with the NGO Centre of the Institute. Apart from high academic qualifications the candidate should have practical experience of working with the NGOs and organizing development programmes in an independent capacity. Both these positions require extensive travelling and stay in villages. The applications with full personal details, academic qualifications, publications and work experience, together with the names of three referees should be sent to:

Director,
Institute of Development Studies,
8-B, Jhalana Institutional Area,
Jaipur 302 004 (India)

within 15 days of the publication of this notice.

vill also become a major exporter." A judgment shared by certain geologists in the JS Bureau of Mines. The petroleum and petrochemical industries provide the base or further large-scale industrial expansion, with the potential for eclipsing both tourism and sugar as national income earners.

In bio-technology, Cuba is a major player. Ciba-Geigy attests, an industry reinforced by joint ventures with British, Asian and Latin American firms. A positive factor enhancing Cuba's attraction to FDI is that its labour costs rank among the world's lowest at current dollar/peso conversion rates. Cuban industrial labour costs are lower than Mexico's. Given the pace of Chinese inflation, Cuban wages are lower than those in China's coastal cities. Hence the competitiveness of its industrial exports.

The emergent 'special period' model is no carbon copy of Vietnam's 'Doi Moi' and China's 'socialist market economy'. Certainly there are points of convergence but the Cuban model has its own distinctness. Cuba is interventionist with public sector planning playing a guiding role. Mahatma and Castro are on the same wave length. Colonisation of the ex-DDR, as a Cuban central banker puts it, was achievable because of political colonisation. In this perspective, the east European experience has been sedulously studied, and has had a cathartic impact on the framing of economic policy. Executed within rigorous political co-ordinates.

When references were made to the implications of the global reach of the world's 200 mega TNCs the Cuban technocrats with whom I spoke were stonished. Distressingly this is due to the fact that the TNCs have never been the object of far-reaching, systematic research. In compensation, however, Cubans have long memories. The rapacity of the United Fruit Company in Cuba in particular, and that of US capital in Latin America in general, have not been forgotten. Facing up to the systematic penetration of 'corporate Capital' is a policy issue, based on knowledge, that can no longer be ignored or covered up by boastful rhetoric on the everlasting glories of socialism.

Nestle's gobbling up of more than four-fifths of Thailand's instant coffee market is suggestive of the forces against which Cuba is pitted stemming from its new orientation. It is not simply Nestle's monopolistic market share that is alarming, but that it has ignored Thailand's anti-inflation marketing guidelines by jacking up prices indiscriminately. How does Cuba intend to counteract such practices?

END OF ISOLATION

The sweeping changes transforming Cuba are transpiring at a moment that

witnesses the end of its long isolation. Indubitably its clearest manifestation is the vote on the embargo in the UN General Assembly. Two countries alone opposed it: the USA and Israel. Which does not prevent Israeli capitalists from investing in the agro-industrial complex. As Cesar Gaviria Trujillo, secretary general of the Organisation of American States (OAS), puts it: "The debate on the present and future of Cuba has been monopolised by the most extreme positions".

Opposition to the obtuse US position is growing not because of any passion for Cuba and the charms of Fidel Castro but because the US embargo is an impediment to those who want to make money. Only Costa Rica, the Dominican Republic, Guatemala and Honduras do not have diplomatic ties. A conjuncture that will soon be altered with the exception of that hardened US satellite: the Dominican Republic.

Cuba is a fully fledged member of the Association of Caribbean States, aimed at creating the world's fourth largest trading bloc with a market of 204m people, and an annual trade volume of \$ 188 bn. Once a servile enthusiast of the US trade embargo, Latin America is now developing full diplomatic and economic relations. Mexico is Cuba's largest foreign investor. Latin America supplies over half of its imports.

Accused of not showing deference to the masters of Capitol Hill the Canadian government has struck back against the Helms/Burton legislation that would tighten even further existing sanctions. "We cannot accept that our Canadian firms, who are legitimately doing business in other countries be restricted by foreign legislations", said Andre Quillet, Canada's foreign minister. These unilateral measures, he went on, will be strenuously opposed by Canada as they violate the charter of the OAS as well as the principles of NAFTA and the World Trade Organisation.

No less important than these spirited rebellions are the stirrings within the ranks of some of the biggest US financial and industrial transnationals. Listen to the voice of Dwayne Andreas, chairman of Archer Daniels Midland, the big grain conglomerate: "Our embargo has been a total failure for over 30 years. We ought to have all the Americans in Cuba doing all the business they can. It's time for a change," he said in a June interview with CNN.

This is the voice of naked self-interest that always propels Capital. Cuba's markets are being grabbed by others. This is the heart of the contradiction between important segments of US Big Capital and the still massively bankrolled anti-Cuban lobby on Capitol Hill. A Mexican entrepreneur puts

it pithily. "I don't want the Americans in Cuba. If they come here, as I suppose they inevitably will, they will have too big a leverage on Cuba's fragile economy. To be honest with you, I don't want their competition and nobody else does."

THE FEEL-GOOD FACTOR

What imparts a new sense of hope is the reversal of fortunes. 1994 marked a modest turning point with a 0.7 per cent GDP growth rate: in the first half of 1995 it rose to 2 per cent. There are enormous difficulties ahead, not least the penury of indigenous financial expertise and the woeful inadequacy of financial accounting procedures and controls. No doubt that too will change. Cubans are fast learners and the imperatives of survival have always been a ruthless teacher.

The grand question still remains: to what extent will the US political caste modify its relations with the island? A *modus vivendi* appears highly improbable primarily because the tenuous historical connections between Cuba and the US throughout the 19th century and after have always been a relationship between the predator and his prey. Cuba's present leadership nourish no illusions of US objectives: unconditional capitulation and the integral dismantling of Cuba's political infrastructure and a return to the status quo ante with a few phoney electoral frills as public relations gimmicks. Impoverished Haiti and the Dominican Republic provide the US caste oligarchy, it believes, with a blueprint of Cuba's future.

A powerful nationalist current in Cuba is convinced that the US political machine does not want an economically strong and viable economy even if a great deal of that strength emanates from a rapidly burgeoning capitalist sector. The identical sentiment is omnipresent in China. In the perceptions of this powerful Cuban nationalist current what the US wants is to destabilise the nation whatever the consequences. This *etat d'esprit* is perhaps best summarised in the severe judgment of foreign minister Roberto Robaina.

Let us not be fooled. All of the measures about which there is so much speculation are also instruments for the submission of our country. They are not debating whether or not to cut off our heads, but how they will do it: knife or razor."

State Bank CHAIRMAN

EXCERPTS FROM THE SPEECH DELIVERED AT THE FORTIETH ANNUAL GENERAL MEETING

Ladies and Gentlemen,

I warmly welcome you to the Fortieth Annual General Meeting of your Bank in this historic city of Madras.

INDIAN ECONOMY

The process of economic recovery was bolstered with the GDP growth rate accelerating to 5.3% in 1994-95 from 4.3% in each of the preceding two years. This process was led by the industrial sector with a reassuring growth of over 8% and an estimated 4% rise in agricultural output.

WORKING RESULTS 1994-95

The year under review was the first full working year after your Bank went public in December 1993 and I very much hope that you will recognise its excellent performance reflected in 160% growth in net profit from Rs. 275 crores in 1993-94 to Rs. 715.5 crores in 1994-95. Earning per share has gone up from Rs. 12.2 (on weighted average equity) in 1993-94 to Rs. 15.08 in 1994-95 on a share of Rs. 10. Capital adequacy maintained, as at 31st March 1995, was 12.77%. Your Bank was able to achieve such handsome results by pursuing a flexible and dynamic business strategy aimed at increasing non-interest income, improving asset quality, reducing resource cost, optimising funds management, and controlling operating expenses.

INTERNATIONAL QUALITY RECOGNITION

Shareholders will be pleased to know that your Bank has again been selected this year as the best Bank in India for the second year running by Euromoney, the well-known international financial magazine. Further, your Bank has just been named as one of the "Best Managed Companies" in India, by a worldwide poll of institutional investors arranged by Asiamoney, also a well-reputed international financial journal. Such recognition reflects not only the improving quality of your Bank's operations but also the growing overseas interest in the Bank.

DIVIDEND

In view of the excellent working results for the year, your Board decided that the rate of dividend for the year 1994-95 be raised to 35%, up from 30% declared for 1993-94.

BANKING SCENARIO

The beneficial effect of the banking sector reforms became visible from 1994-95 in the form of improved working results of banks. Under the new economic policy there has been continuing deregulation and liberalisation of the banking system and the financial sector during the year, making the business environment more challenging. For banks in India including your Bank, therefore, the need to improve efficiency and competitiveness is steadily increasing, and I want to assure you that your Management is fully alive to this need.

In recent months, there has been some sign of inadequacy of loanable funds at the disposal of banks in India. Nevertheless, the banking system responded vigorously to the demand of the commercial sector. The demand for credit has continued to grow

strongly because of the sustained growth as ongoing new investments. Despite this, the Bank has managed to meet the requirements of its farm and hopes to be able to do so on an

EXPORT CREDIT

Consistent with the growing trade of the country, the demand for export credit has also been increasing. In the year ended 31st March 1995 accounted for 10% of the Bank's mandatory requirement of 10% excess of 14%.

If our exports are to be competitive in the global market, we need to reduce this interest cost borne by the exporters. The solution is to move gradually towards a more competitive rate of interest from achieving appropriate macro-economic objectives, such as lowering of overall interest rate structure, such as developing new financial instruments for various financial instruments.

PRIORITY SECTOR LENDING

Your Bank's share of advances to the priority sector, as on 31st March 1995 was 30% of the total bank credit, which is below the benchmark of 40% that needs to be achieved. Lending to the priority sector is increasing but our performance was still below that of the total bank credit during the period. I believe, for the authorities to encourage the growth of priority sector advances, the credit is operationally realistic. As in the short period of time and by high volume of lending to the priority sector, it becomes very difficult to absorb credit in relatively small individual units. There is thus a need to improve the performance of banks in lending to the

ORGANISATION

I mentioned in my address to you the study of organisational change required for the Bank to be able to report that the study was correct. Several organisational changes have been implemented. We have moved towards a relatively distinct business groups for better management of Heads with clear profit responsibility.

Bank of India

M'S SPEECH

AT MEETING OF THE SHAREHOLDERS HELD AT MADRAS ON AUGUST 8, 1995

growth in industrial output and exports, as well as the pressure on resources, your Bank has been able to assist manufacturing and exporting customers fully on a going basis.

ON CREDIT

and exports, the volume of export credit from the banking system as a whole, credit to exporters as 12% of the net bank credit as against Reserve Bank. In the case of your Bank, the figure was in

international markets, we need to do what we can by exporters. Commercial banks cannot be expected to offer commercial rates of interest. The real solution is a lower overall interest rate structure. Apart from balance, which is a necessary condition for success, there are also other tasks to be achieved for the products and creating efficient secondary markets

SECTOR ADVANCES

priority sector, as a proportion of its net bank credit which fell marginally short of the stipulated target. During the year, your Bank's outstanding credit reached a sizeable amount of over Rs. 1,400 crores, well above the benchmark mainly because of the sharp growth in January to March 1995. However, there is a question whether the present system of linking the credit to the contemporaneous growth of total bank credit in other sectors often expands rapidly over a period of time as was actually the case in the latter part of the year. Such expansion with corresponding expansion in the same time-frame as this sector typically does spread over a large number of banks. We need to establish an alternative benchmark to measure the growth in the priority sector.

ON RESTRUCTURING

the year that we were engaged in an in-depth restructuring and that in this process we were being assisted by a management consultancy firm. I am happy to be able to report that during the year, and resulting therefrom, a number of changes have been brought about at the Bank's Central Office. We have reorganised the organisational structure; have identified and reorganised the business units as discrete businesses by Group. We have created new staff positions such as those

of Chief Credit Officer, Chief Financial Officer and Corporate Development Officer; and have revamped key management processes in areas of credit, financial management, asset/liability management and human resource management. New empowered internal forums such as Credit Policy & Procedures Committee, Central Office Credit Committee, Asset-Liability Committee, etc., are now in place and have started functioning. We have set up a separate Corporate Accounts Group to handle accounts of key corporate customers requiring multidimensional facilities, a Leasing Division and Project Finance Division - all reporting directly to the Central Office. We are now focussing on the organisational changes in Circles. We have developed a design model for Circles on the basis of our study referred to above. This is now being tested in two of our Circles before being made ready for implementation throughout the Bank. A major task under the organisational change programme is to nurture the identity and growth of the National Banking Group which will now focus on the Bank's business served by its vast branch network, particularly the middle market, the small scale sector, agriculture and development banking.

We strongly believe that the organisational changes that we have initiated would lead to a leaner and more agile organisation, significant delayering of management processes, speeding up of decision-making particularly in the credit area, and clearer focus on identified business segments. All this should result in better value-added service to our customers and improved profits for your Bank.

OUTLOOK FOR SBI

In my address to shareholders last year, I had commented at fair length on the prospects ahead for State Bank of India. From the feedback we have been receiving from our customers and at various customer forums, there is certainly a need to improve the general quality of our services. All of us in the industry must now single-mindedly devote ourselves to improving our services to our customers and, in turn, add value to our shareholders. I must say that in your Bank there is today a wide recognition about the need to provide satisfaction to customers and I think, at operating levels, our personnel have become more customer-friendly than before. I can say that at several locations I have personally received positive feedback from our customers about quality of our service and the friendliness of our operating staff. That this has been so in an increasingly competitive environment testifies to the dedication and motivation on the part of many of my colleagues serving, as they often do, at distant, difficult and far-flung locations and I do want to recognise their good work. At the same time, I cannot overlook the fact that we still receive a large number of complaints from our customers - not only of poor service but, unfortunately in several cases, of indifferent or unhelpful attitude and behaviour. I fully recognise the need for bringing about a quick change in this situation and I am certain that all colleagues in the Bank share this concern. Your Bank has major strengths - in balance sheet, in capital adequacy, in its unmatched resources, in its vast branch network, in its superb human resources and in its well-honed skills in complex business such as corporate finance, international banking, finance to small scale industries, etc. Its weakness, if any, has been indifferent customer service at some branches. I am sure that, once we are able fully to address this issue of customer-service in a decisive way, nothing can hold back your Bank in its trajectory of growth.

Marginal Environments and the Poor

Evidence from India

T G Kelley

P Parthasarathy Rao

Often conjectured, but rarely substantiated, is the claim that rural poverty is more acute/severe in more marginal and less developed regions, i.e., where average yields of crops are characteristically low due to poor rainfall or poor soil conditions. This note challenges this statement both for its precise meaning and the empirical evidence for it.

THE debate over where scarce R and D resources should be allocated – to the more poorly or better endowed regions of India – is often clouded by largely unsubstantiated views about where the bulk of the poor are located. Many maintain that a disproportionate number are found in the more marginal environments. Evidence presented here suggests otherwise.

According to the 1990 *World Development Report* [World Bank 1990] more than one billion people in the developing world are living in poverty. Of this about 420 million poor are in India alone,¹ 80 per cent of which are in rural areas. Often conjectured, but rarely substantiated, is the claim that rural poverty is more acute/severe in more marginal and less developed regions, i.e., where average yields of crops are characteristically low due to poor rainfall or poor soil conditions.² Such statements rarely go beyond that. In this note, we challenge that statement, both for its precise meaning and the empirical evidence for it. Specifically, we test the hypotheses about relative and absolute incidence of poverty in the more marginal regions of India. We conclude that while the relationship could be valid for the relative incidence of poverty (higher proportion of poor in marginal areas) – though data here fails to support this, it is not true with respect to absolute numbers of poor (less numbers of poor in marginal areas). Needless to say, this has important policy implications since research and development programmes often explicitly target these 'poorer', marginal environments on equity grounds.

We propose to test first the hypothesis about absolute numbers of poor using data for India. Ideally, district level data would be used with the following model,

(1) $RP_i = \beta_0 + \beta_1 TCA_i + \beta_2 \%MCA_i$, where, RP_i is the absolute number of rural poor in the i th district, TCA_i is the total cropped area for the i th district, and MCA_i is the share of the total cropped area in the i th district classified as marginal (used as a proxy for an index of 'marginality'). We

would expect RP_i to be positively related to TCA_i , i.e., the larger the cropped area, the greater the number of poor. The sign of β_2 is our main interest, however. A positive sign would indicate that marginal environments are associated with greater numbers of poor (numbers of poor increase with an increasing proportion of marginal land). A negative sign would indicate the reverse: less numbers of poor in marginal environments. This is by no means counter-intuitive; quite likely marginal lands are unable to support the same numbers of (poor) people, i.e., have a lower carrying capacity, than the more favourable production areas.

Obviously much depends on how one defines 'marginal'. We have chosen to use a crop output value as a measure of 'marginality', i.e., lower values correspond to more marginal environments. For the crop output value we rely on a district classification index by Bhalla and Tyagi (1989). They used average values of production (gross returns in Rs/ha) for 19 major crops for districts in the 16 major producing states of India for production years 1980 to 1983. Rather than presenting specific values for

each district, Bhalla and Tyagi classified districts into six major groups: (1) districts whose average crop value exceeds Rs 1,750/ha; (2) districts whose average crop value is between Rs 1,750-1,250/ha; (3) districts whose average crop value is between Rs 1,250-1,000/ha; (4) districts whose average crop value is between Rs 1,000-750/ha; (5) districts whose average crop value is between Rs 750-500/ha; and (6) districts whose average crop value is below Rs 500/ha.

Thus, by our definition, districts with low values of crop production – below some defined minimum level (we use both Rs 500 and Rs 750) could be classified as predominantly marginal environment districts.

Notwithstanding this grouping of districts limitation, there is another more troublesome data availability problem. Rural poverty data for India at the district level is not readily accessible (presently). State-level data, however, is. These two data limitations force us to specify a slightly different model to test our hypotheses. The form of the model is identical, except the unit of observation is now states, not districts. To some (indeterminate) extent this qualifies the results. More robust findings will have to await better data availability.

The modified model is thus
(1') $RP_i = \beta_0 + \beta_1 TCA_i + \beta_2 \%MCA_i + u_i$, where, RP_i is the absolute number of rural poor in the i th state (in millions), TCA_i is the total cropped area for the i th state (in 000 ha), MCA_i is the share of the total cropped area in the i th state classified as marginal (i.e., the total cropped area of the districts falling below Rs 750/ha divided by the total cropped area in the state, i.e., an approximation), and u_i is the random error term (with the usual assumptions of normality of distribution and zero mean).

TABLE 1: STATEWISE NUMBER OF RURAL POOR AND MARGINAL CROPPED AREA

State	Rural Poor 1983 ¹		Marginal ² Cropped Area (000 ha)	Marginal Cropped Area (Per Cent)
	Million	Per Cent		
Andhra Pradesh	14.8	34	1637	12.2
Assam	9.2	48	0	0
Bihar	44.9	70	1130	11.0
Gujarat	8.8	36	1779	17.1
Haryana	2.5	24	0	0
Himachal Pradesh	0.9	23	0	0
Karnataka	11.0	39	4974	43.3
Kerala	10.1	47	0	0
Madhya Pradesh	23.3	53	16005	70.7
Maharashtra	22.8	53	16114	76.3
Orissa	16.0	66	426	4.4
Punjab	2.3	18	0	0
Rajasthan	11.9	41	11039	58.8
Tamil Nadu	19.0	56	0	0
Uttar Pradesh	46.9	49	2143	8.6
West Bengal	27.5	65	0	0

Source: 1 Poverty data from Minhas et al (1991).

2 Marginal cropped area data calculated from Bhalla and Tyagi (1989), by adding the TCA from all districts in each state with productivity levels less than Rs 750/ha, for 19 major crops (1980-83).

Data for the 16 major states in India were assembled for this analysis. State-level data on the numbers of rural poor and population was obtained from Minhas et al (1991). They used income data from the National Sample Survey (NSS) from 1983, which was adjusted for cost of living differences between states. The total number of rural poor for the 16 states under consideration in this analysis comes to 270 million (Table 1). Total cropped area for the 16 states was collected from government of India, 1986.

ABSOLUTE NUMBERS OF POOR

Since the definition of marginal environment is somewhat arbitrary we decided to test our hypothesis about the incidence of poverty by varying the lower limit of crop output value which was used in defining a 'marginal environment district'. Accordingly, three model runs were estimated. The first (Estimation A) classified those districts with productivity levels less than Rs 500/ha as marginal environment districts. A total of 21 districts fall in this category. Total cropped area in each of these districts was summed up for each state and expressed as per cent to the respective state total cropped area. This variable is called marginal cropped area (%MCA) expressed in percentage terms (Table 1). The second (Estimation B) classified as marginal environment districts those districts with productivity levels less than Rs 750/ha. A total of 89 districts fall in this category. The third model (Estimation C) grouped all districts below Rs 1000/ha as marginal environment districts, a total of 154 districts fall in this category. Results of the estimated equations are shown in Table 2.

For Estimation A, %MCA is negatively and significantly related to rural poor, i.e., as %MCA increases the number of rural poor declines. For every 1 per cent increase in %MCA, the number of rural poor declines by 3,80,000 (or 0.38 million). TCA was, as expected, positively related to number of rural poor. Both these variables explain 46 per cent of the variation in rural poverty across states in India. This supports our contention that there are less absolute numbers of poor in the marginal areas.

Similar results were obtained in Estimation B where %MCA includes all districts with an average value of crop production less than Rs 750/ha. Significant levels are a bit higher (significant at 0.05 versus Estimation A which was significant only at 0.10) and here the model explains 51 per cent of the total variability in state rural poor numbers.

In the third model (Estimation C) which grouped all districts below Rs 1000/ha, %MCA is still negative but not significant. Thus, as the classification of marginal environments includes a higher proportion of districts with higher average crop output values (we assume this corresponds to more favourable environments), this negative relationship tends to weaken, i.e., we tend to see more numbers of poor as the environment 'improves'.

PROPORTION OF POOR

Here we consider it plausible (and thus we hypothesise) that higher rates of poverty exist in the marginal areas, i.e., as the proportion of marginal cropped area increases the poverty rate also increases. For this hypothesis the following model was used

$$(2) \%RP_i = B_0 + B_1 \%MCA$$

where %RP = per cent rural poor in the *i*th state, and %MCA is the share of the total cropped area in the *i*th state classified as marginal. This variable is similar to the one used in the equation on absolute poverty. Similar to the absolute numbers of poor analysis, three model runs were estimated: grouping districts whose productivity levels were less than Rs 500/ha (Estimation A), less than Rs 750/ha (Estimation B) and less than Rs 1000/ha (Estimation C). Results of the estimated equations are shown in Table 3.

All three estimations had low and insignificant R^2 values. And only in Estimation C do we see anything even approaching a significant (but positive) relationship between %MCA and poverty rate. The data offers no support for the hypothesis of increasing rates of poverty in marginal zones. The fact that Estimation C alone had a positive coefficient with *t*-value above 1.0 – if anything – suggests higher poverty rates in less marginal areas (i.e., in more favourable zones).

Interestingly, while data on rural population density was, as expected, negatively correlated with %MCA (significant at 0.05 probability), rural population density is positively associated with per cent rural poverty – a result somewhat counter-intuitive, perhaps. This, of course, requires further study before any conclusions can be drawn.

Notes

1. Minhas et al (1991) estimates somewhat lower figures – about 360 million poor altogether, of which 280 million are rural. His estimates are based on the most recent NSS income figures adjusted for regional differentials in cost of living expenses.
2. Definitions for marginal environments abound [e.g., see Virmani 1992]. In this paper we have chosen this definition, i.e. relating marginal environments to a crop productivity measure.

Privatisation in East Europe

Nigel Harris

United Nations Conference on Trade and Development/Kopint-Datorg, **Privatisation in the Transition Economies: Recent Experiences in Eastern Europe**, United Nations, Geneva, December 1994, pp 418.

MACRO-ECONOMIC reform in developing countries has become a global obsession, as universal as import-substituting protectionism was in the developed countries in the 1930s and 1940s, and in the developing countries in the 1950s and 1960s. Furthermore, the agenda of reform has become strikingly uniform, summarised in part in John Williamson's 'Washington Consensus' (1990). Reform provides the target for what Bergstein and Williamson call "a global stampede in the last quarter of the twentieth century" [Williamson 1994:3].

Countries of every geographical region, income level and ideology have joined the rush. Asians, Europeans, Latin Americans and Africans: countries once among the richest in the world (such as Argentina, Australia and New Zealand) and countries near the bottom: capitalists, socialists and those in between.

The political range is indeed extraordinary, suggesting that the reactivity of governments to external events is very much more important in shaping policy than prior political commitments. The spectrum covers overtly Communist regimes (China 1978, Vietnam 1989, Laos 1990, without mentioning the much older attempts at market reform in the former Soviet Union and eastern Europe), Social Democratic (Australia, New Zealand, Spain, Portugal, France), Liberal Conservative (America under Reagan, Britain under Thatcher), Leftist-populists (Menem's Peronists in Argentina, Salinas' PRI in Mexico), and the newly democratising Russia and eastern Europe.

Structural adjustment has the reputation of requiring authoritarian regimes, but only a handful of countries have experienced a military coup preceding reform – Suharto in Indonesia (1966), Pinochet in Chile (1973), Turkey in 1980, Ghana in 1983, and South Korea in 1980 (by contrast, most military coups have not led to reform). On the contrary, emergence of an integrated global economy which has impelled this uniformity of reforms may in future years be credited with dissolving authoritarian regimes – most strikingly with the old Soviet Union or apartheid in South Africa.

In some cases, a dedicated minority has fought to come to power in order to reform. But more often, it is the old order which had

been obliged to take up the task. Indeed, in some cases, political leaders have come to power with one set of aims (or one reputation) and have apparently been converted in office – most strikingly with France's president Mitterrand in the early 1980s, with president Menem in Argentina, finance minister Kweisi Batchwey in Ghana and even Manmohan Singh in India.

Furthermore, so universal has the new orthodoxy become, when the opposition comes to power, it does not reverse the reform package nor seek to return to the status quo ante. This is even true where the reform regime originally came to power through violence, leaving a legacy of at least anguish, and at most, the demand for retribution. President Aylwin in Chile has modified the policy framework put in place by Pinochet's regime [Bosworth, Dornbusch and Laban 1994], but not reversed the basic form. Turgut Ozal continued the reform programme in Turkey from the military to the civil regime, as did South Korea's Roh Tae Woo, doffing his army uniform for elections.

The reform programme has also dissolved the traditional political alternatives. They have not so much been defeated as suddenly lost meaning. The old corporatist conservative Right with its emphasis on the decisive importance of a powerful state has

gone, surviving only where its proponents transmogrified themselves into what they formerly hated, 19th century free marketeers. The Left which for so long fashioned its political alternatives on the basis of a *dirigiste* state, in part or whole absorbing civil society, found its chosen vehicle an increasingly ineffective instrument for its purposes; it shrank and swapped class for the softer focus of community. The brave beacons of progress – Cuba for some, Sweden for others – have dimmed and now fallen. Finally economic nationalism, so universal in developing countries 25 years ago, is on its last legs. Economic crisis in the 1980s did what no amount of IMF or World Bank persuasion could earlier have achieved.

The universality of the change, the diversity of the sources apparently converging on a uniform agenda, suggests a common force at work. Each national economy, it seems, is being reshaped by reactions to a new phase in the development of the system: the emergence of an integrated, as opposed to an interdependent, global economy, enforcing as never before in such detail common disciplines regardless of local differences. Among the leading powers, governments are becoming increasingly unclear as to what their national economy is, what their national economic interest is; they administer no more than a fragment of the whole.

RUSSIA AND EASTERN EUROPE

Nowhere has the process been more dramatic or more rapid than in what used to be called the Centrally Planned Economies. There the process of stratification had gone further than anywhere else – although the western war-economies during the second

world war have similarities – and the collapse was even more extreme. In the terminology of the *ancien regime* there, the counter-revolution has been almost complete, suggesting the changes have long been in the making beneath the surface.

If we followed, by analogy, a Leninist model of this change (the Lenin of *State and Revolution*), to be a complete counter-revolution, the personnel of the old order would have had to be largely replaced by newcomers. Schumpeterian entrepreneurs and capitalists would have replaced the civil servants who directed the giant industrial ministries and combines. They would have done so swiftly in order to prevent a counter-attack and restoration of the old order, for, as two Russian authors observe:

State property is the last defensive line for the opponents of reform. The branch ministries are eager to control the process of privatisation and to get control of the package of shares or to create huge industrial-financial corporations in order to restore the traditional forms of management [Yevstignejev and Voinov 1994:6].

This is the broader systemic significance of privatisation. In practice, since people have largely forgotten what nationalisation was for, they have equally devalued the idea of privatisation.

CASE FOR NATIONALISATION

What was the original case? After the Great Depression of the interwar years, socialists concluded capitalism as a force for economic growth and development was finished. Others argued in the 1950s in the new discipline of development economics that, whatever role private capital had played in the early phases of development in the developed countries, it could for many different sorts of reasons not play that role in the developing countries. In the same way, development could not take place through increased international trade or the import of foreign capital. Only the state, directing the economy (whether through direct public ownership or directing private firms) and basing growth on the domestic market, could now develop a country.

Furthermore, production for use, rather than profit, was, it was said, the prerogative of the state, and therefore state activity in the economy embodied the march of progress – in the face of the opposition of those interests which wished to monopolise the social surplus for their exclusive use. State enterprise (as Brus, in this volume:47) notes was seen as superior in ethics in justice and in desirable socio-economic ends (it abolished exploitation and alienation), and these characteristics raised it to 'the sacrosanct level of a new order'. It was technically superior, eliminated duplication and waste, it made possible central planning and so the full development of a collective rationality

to secure rational behaviour by macro-economic criteria (full 'internalisation of externalities'), to gear production to genuine human needs, undistorted by the skewed distribution of purchasing power, and to eradicate the absurd coexistence of excess capacity, excess labour and unsatisfied needs by an *ex ante* matching of aggregate savings and investment (ibid:47).

Note that the case was not particularly socialist although it came so to be seen. There were important right-wing thinkers who also found the case seductive – see for example, the British Conservative leader, Harold Macmillan, in the 1930s. Professional managers in large corporations tended to find the ideology of planning of much appeal. Furthermore, the case came to be supported by a whole branch of economic thought where elements attributed to Marx, but refashioned from a nationalist perspective (leave aside whether this was a valid exercise), were interwoven with those from the middle period of Keynes. In retrospect, it was a kind of extreme mercantilism in which the interests of the state overrode all others.

By the 1970s, the case had become more defensive and instrumental – public ownership was to achieve particular ends of policy rather than a new social order. Nationalisation was now seen as a means to regulate natural monopolies, to eliminate foreign in favour of local ownership, of securing access to income and rents in natural resource industries, to appropriate 'strategic industries' (those supposedly of special significance for long-term development) in order to enhance the capacity of the state to expand without reference to markets, and to prevent bankruptcy and layoffs (India has the strongest record on this score).

A paean of praise presented so uncritically ought to have encouraged us in an initial scepticism. Such arguments are usually advanced to conceal much narrower interests. Furthermore, the overt case also provided a cover for something different: the struggle of the state to preserve its independence in conditions of ferocious rivalries between states. It was not accidental that the growth of heavy industry, so extravagant in capital when capital was so scarce, became the central criterion of success for the planned economy, not because it 'made the machines which made the machines', but because it also made the means to kill. Looked at in the context of rival imperialisms, the planned economy made much more sense as an attempt to create as swiftly as possible an adequately prepared war economy, regardless of its effect on the welfare of the population.

If there were overt and covert purposes in the extension of the role of the state in the economy, practice was different again. The state and its officials were not Plato's Guardians, a force of disinterested

benevolence pursuing the interests of society at large, nor even the 'executive committee of the bourgeoisie'. The state had a collective interest which was different (and indeed, often in conflict with) the heterogeneous interests of society, and its officials also had private agendas of their own. The state enterprises which were supposed to generate major increases in savings for society as a whole has often generated losses, which in turn absorbed part of the savings of the rest. State officials pocketed another part. In the Eastern Bloc, the large State Owned Enterprises (SOEs) were the power base of the old nomenklatura, allied to conservative strata in the most privileged part of the workforce, dedicated to blocking any infringement of their prerogatives and with no built-in drive to expand society's productive base. Influence, contacts, political favours in an opaque context in which few consistent criteria were publicly known replaced any real evaluation of priorities for investment.

While there was no rigorous evidence that state ownership was, in principle, less efficient than private [Israel 1990, Milward 1989], in practice it was much more subject to influence by special interests. The state would usually not allow its dependencies to be bankrupted, so it was obliged to cover any deficits, so there were no sanctions for failure. This did not necessarily mean private gain – governments used SOEs to implement social policy, to hold down prices in the interests of an anti-inflation policy, to retain workers without any useful role, etc, all tending to increase deficits and so weaken the incentive of managers to operate financially a tight ship.

In the Eastern Bloc, public ownership did not indicate a clear cut set of rights, distinguished from private prerogatives, but rather the lack of legal constraints upon the actions of state officials – the "unconstrained disposability of assets by central authorities" [Brus here 47]. Public property was property that belonged to no one, and therefore anybody, if they could, would raid it.

What had been tolerable for a very long period of time became intolerable in the 1980s. With extraordinary speed, everything went into reverse – foreign capital was welcome, imports were no longer a foreign invasion, trade could develop a country – and public ownership came under increasing attack.

However, the justification of privatisation spanned as wide a range of ends, some of them mutually exclusive, as had the case for public ownership. Some saw it as the means to destroy the old order once and for all, to create some prototype of a private capitalist economy and a middle class representative democracy through the redistribution and decentralisation of economic power (as expressed for Poland in the book reviewed

here Blaszczyk and Dabrowski 91) This would be the Leninist mode of counter-revolution. Others saw it as a technical matter to improve the efficiency of enterprises, the rate of growth of productivity and innovation to end political interference or favouritism distorting economic objectives and to create an economy responsive to macro-economic management. Some used the distribution of shares to the population at large as a means to buy political popularity and make more secure their hold on power – in conditions of great political instability and, quite often economic hardship. In Russia, it was used to bribe the existing managers to accept reform. Ministries of finance saw selling off public assets as a means to cover the fiscal deficits that followed economic crisis and make possible enhanced public spending. Yet others saw privatisation as the most unequivocal demonstration to foreign lenders of a regime's commitment to reform – of the seriousness of its application to join the western world.

THE PRACTICE

This book is an excellent compilation of writings by 18 authors on the process of privatisation in, by conventional criteria, the most successful group of east European countries, the Visegrad group – Poland, the Czech and Slovak Republics, and Hungary.

A set of general presentations are made, followed by three or four papers on each country, followed by a set of commentaries. The contributions were made to a Budapest workshop in 1993. In general the accounts are solid, authoritative, well argued and well documented. The contributors tend to be sceptical about the claims for privatisation or actively hostile either in principle or practice, although all accept the case for radical reform.

The practice, after two years of experience, is as Yilmaz Akyuz's introduction puts it, disappointing, although few of the authors distinguish sharply enough between what can be safely attributed to reform and what to the major economic crisis which hit eastern Europe in the late 1980s. Indeed that crisis – and the political challenges it generated – shaped all responses. As always, there was not time for a carefully-crafted, technically optimal policy.

So far as the SOEs were concerned in any case, earlier steps towards reducing central control, enhancing decentralisation of managerial authority had a disastrous effect. The SOE officials in many cases ransacked the assets, setting up a shoal of private subsidiaries under their control to receive the assets ('privatised') at giveaway prices to purchase the SOE output at below market prices (on selling the output at market prices)

or to sell to the SOEs inputs at inflated prices. Private profits were, for the old SOE officials, the other side of the balance sheet to SOE deficits. Where state finance was seen as simply a cost-free servicing element in the economy, the SOE deficits were simply covered by the state, representing a neat transfer of funds from the state exchequer to private accounts of SOE officials. In a soft financing context SOEs just stopped paying their bills, and even their workforces – intercorporate debts became enormous. The bureaucrats did not become public sector managers, they became kleptocrats. And far from political issues becoming removed, they were enhanced – the decisions on privatisation were highly political, mediated through still emerging processes involving strong interests and lobbies, and with a genuine possibility of a popular backlash in societies sensitive to wide divergencies of wealth' [Dhanji and Milanovic 1991].

Privatisation was itself shaped by immediate exigencies – the ongoing slump in output while asset raiding continued (necessitating a speedy remedy), high inflation, inadequate savings in the population at large to purchase the assets (without an effective capital market), fears that foreign interests would have the resources and might take over the economy (in fact, foreign interests showed remarkable

The journal reflects the widening horizon of Indian history by publishing essays on a range of themes, from systems of production to modes of thought and perception, from dimensions of power to forms of resistance, from the politics of institutions to the logic of social movements.

The journal seeks to transcend the conventional divisions that fragment history, the chronological barriers that divide the historians of ancient times from those working on medieval or modern periods, and the disciplinary boundaries which distance the historian from anthropologists, economists, or literary theorists.

disinterest in the old 'commanding heights'), the lack of people with sufficient knowledge to evaluate the performance of companies, the high degree of concentration of capital, the lack of competition, indebtedness and corruption.

Nonetheless, formally a significant transfer from public to private occurred. The least was in Hungary – by late 1994, about 40 per cent of SOEs (by book value) had been transferred. Poland, with about 8,400 SOEs in 1990, still has 5,400 in public ownership (but 1,700 undergoing bankruptcy proceedings). Even in the Czech Republic where the transfer was most rapid and complete, the state's National Property Fund has held on to about 20 per cent of the assets in 400 companies.

Beneath this formality, things look more complicated. Very little prior restructuring took place, so that in some cases, public monopolies have been turned into private monopolies, but without a framework of regulation. Often the cumulative debts have been 'written off', removing the market sanctions that might spur reorganisation. When in doubt, governments have accepted the prior claims of existing officials who have then inherited power and sometimes ownership. In some cases, they have succeeded in entrenching their positions so that they cannot be ousted by powerful shareholders – again, restructuring has been impeded.

In the Czech Republic, the population were issued with vouchers, a method "not adopted for its economic efficiency, but for its speed in order to accomplish as much privatisation as possible before the election" [Wagener, here:294]. As Stark notes [ibid 413], "The consequences of the voucher privatisation was not to make a popular capitalism, but to make Vaclav Klaus [then finance minister – NH] popular". The vouchers were handled by a group of investment funds which then bid for shares in the SOEs. The state-controlled banks had major interests in the 10 leading investment funds (the top 14 funds controlled 55 per cent of the vouchers issued and, after purchase, 43 per cent of the shares in the newly privatised companies), and they also purchased shares on their own account. In essence, the state's banks acquired "nearly absolute control over the Czech economy" [Dlouhy and Mladek 1994:168]: "banks funded by the state have founded investment funds which in turn acquire ownership of the banks, which can acquire ownership of firms through the voucher system" [Stark, here:414]. Furthermore, on the one hand, the state's National Property Funds retained predominant interest in a number of key sectors (steel, energy, telecommunications). On the other, voucher privatisation diffused ownership over a mass of small shareholders, incapable of exercising any watching

discipline over the newly privatised managers; the shares are held as a form of savings, so there is little turnover, and this makes it difficult to build up a holding capable of influencing, let alone displacing, existing managers.

Hungary has sold assets at value and up to relatively recently this has meant foreign interests have dominated those fields seen as potentially profitable (which does not include the great fortresses of heavy industry). However, a scheme of subsidised credit has been introduced to widen the market, and the government has tried at various stages to ban foreign bidding for particular sectors (it is a muddled response since no one knows why foreign capital is likely to behave differently to local).

PRIVATISATION

In sum, the state has retained a dominant role – and so have the old officials who administered, on behalf of the ministries, the SOEs. The counter-revolution is, in terms of personnel, very far from accomplished.

What is in fact properly 'private' in the non-agriculture sector is the mass of new businesses that have developed since 1990, most of them very small, heavily concentrated in the retail trade, hotels, restaurants and services, many of them part of a grey or black economy, outside legal regulation or the net of tax contribution. They are still on the margins of the system of public power, still tolerated rather than encouraged.

If the properly private conforms in some respects to a supposedly competitive capitalist system, the newly privatised is much more like Hülsmann's finance capital, giant groups of former SOEs, often linked to a bank with strong links to the state and its favours. Has enough market decontrol been undertaken ultimately to reshape this structure into more competitive forms? It depends upon the discretion of the state. If imports and foreign capital are still controlled, then the old leviathans can continue – at a heavy cost to the rest of the society. Here the political coalition that runs the new order is all-important. In general, the western advisers lacked a sociology to understand how market imperatives can be entirely transformed by the existing structure of interests. Furthermore, appropriate institutions are not created on horseback as an afterthought, and without those institutions, the nomenklatura in industry has survived. The fears of those that the old order would succeed in manipulating a slow reform process have been born out, even where the reform has been swift (as in the Czech Republic and Russia). Indeed, the distinction between public and private has become even more blurred than before. Change there has been – and it can be seen in the improvements in supply as well as the extraordinary growth of exports to hard-

currency areas – but this is still far from being the creation of competitive market economies.

This volume is a fascinating presentation of different viewpoints on these important questions. Despite now being inevitably rather out-of-date since the processes have been developing very swiftly, it provides an overview of the issues which is invaluable. It allows us to broaden the scope and apply the agenda of criteria to include the other Europeans (Bulgaria, Romania, Albania), Russia and the CIS, and the Asians (China, Vietnam). There is only one reservation – the wretched binding on this book means the pages fall out after one reading. Perhaps it was produced by one of Hungary's newly privatised printing companies.

Note

- 1 "... To ensure speedy privatisation... breaking the ownership position of the branch ministries was the overwhelming priority if the irreversibility of the transition was to be ensured... the speed deemed necessary could not be attained without 'bribing the insiders' " [Sutela 1994:418]

Communalism and Violence

Roma Chatterji

Lifting The Veil: Communal Violence and Communal Harmony in Contemporary India by Asghar Ali Engineer; Sangam Books, Hyderabad, 1995; pp vii+347, notes, index; Rs 325.

THIS collection brings together a variety of essays concerned with communalism and violence in India. Even though the essays have been written at different points in time in response to specific political events, they achieve a thematic coherence as they are placed against the backdrop of the Ram Janmabhoomi/Babri masjid controversy. The author seeks to understand this as a symbol of conflicting group identities that articulate the aspirations of new political agents competing over scarce resources. If, as the author states, the violence that ensued as a result of the destruction of the Babri masjid marks "the lowest point in Hindu-Muslim relations in post-partition India", this relationship also has a dimension that can be understood only in terms of the larger developmental process in contemporary India. The democratisation of the political system has created new opportunities for mobility and for the articulation of new modes of group identity. Violence results as a consequence of the efforts of deprived groups to use the political system to renegotiate their status. Religion as well as other markers of collective identity like ethnicity and caste can become the focii for the organisation of communities that function as interest groups. Thus a democratic political structure imposed on a social system that is rigidly stratified and fundamentally unequal can lead to a highly volatile situation. And when the society in question is in a condition of material instability religion often serves as a defence mechanism. There is an assertion of religious identity when the society is in political and economic decline.

The author explores this thesis through a series of interrelated themes. The book moves from a general discussion of communalism and ethnicity in India and other parts of south Asia to a detailed description of the riots that followed the destruction of the Babri masjid in 1992 and the specific conditions that led to it. This latter forms the bulk of the book and apart from accounts of the riots themselves, the author addresses issues that range from the role of the press in influencing representations of violence, to the analysis of political events like the 1991 Lok Sabha elections that influenced the course of events that were to follow. Finally, in the concluding section of the book, the author takes up the issue of secularism, exploring the history of the term. To this end he tries to place the contemporary

debates between the different political parties on secularism in the context of India's composite tradition. A tolerance of pluralism is not merely an ideal propagated by mystical, other worldly doctrines like the Bhakti and Sufi movements but rather the organising principle behind all historical attempts to create stable polities. However, it is interesting that the medieval period when these movements arose is also represented as being one of unrelieved conflict between Hindus and Muslims. The history of this period is viewed through rigid stereotypes in which Islam is portrayed as the religion of the aggressors who imposed their doctrines on peace-loving Hindus, made non-aggressive by their belief in religious tolerance. But, as the author says, if the ding-dong battle between different political parties on the true nature of secularism is seen in this light it becomes another power game using history as its medium. The paradox, of course, is that if the stake in the search for true secularism is democracy itself, because only a democratic structure can ensure communal amity, it is also democracy that unleashes a political process that uses essentialistic categories like religion and ethnicity to create interest groups for its own ends. If this is one of the ironic conclusions of the book the author also makes a plea for a critical evaluation of Indian history and tradition and a return to those aspects that may help to renew the civil society.

While it would be difficult to disagree with the sentiments expressed in this book, the theoretical framework in which the issue is posed is somewhat problematic. For the author economic development is invariably accompanied by violent upheavals in society. This may take either class form or ethnic and communal form depending on whether it takes place in a socialist or capitalistic framework. The assumption is that ethnic and communal prejudice that are primordial are given a new form with the rise of colonialism and then capitalism. The challenge for newly-emergent nations then is to be able to transcend particularistic allegiances to achieve universalistic principles based on justice. However, an explanation that seeks to locate the problem of communalism within the politico-economic structure of society does not help in understanding this. Communal competitiveness creates a vicious circle of violence, for the author, because power is

seen as a zero sum game between different communities. But by explaining violence in terms of the social forces that create it we also remove from it any consideration of agency. Violence becomes faceless, an anonymous force that creates its own momentum, that comes to an end only when it is spent.

Communal competitiveness is based on the principle of sameness. Religion, ethnicity, caste or class all function in similar ways – they serve merely as markers of group difference. They express relations of symmetry between different groups and in this case where these relations are based on violence, these markers are used as defence mechanisms to protect each group's fragile identity. To break out of this vicious circle the frame of the explanation must be changed. Violence must be understood within an ethical frame, in terms of suffering. This will give a face to violence, and allow for the recognition of agents as well as victims and also make possible perhaps an understanding of coexistence as a relationship in which we are responsible for the other. This would involve an expression of identity with the other not so much in terms of a similarity of desires which may bind us in relations of competitive violence but rather a recognition of shared vulnerabilities. Thus, a recognition of the rights of the other must go beyond an acknowledgement of common aspirations and must be based on the assumption of shared responsibility, a responsibility for the other's very existence.

People's Bill on Nature, Health and Education

P R Seshagiri Rao
Madhav Gadgil

The challenge today is to evolve a system of sustainable use of natural resources, conservation of biodiversity and maintenance of a good public health environment by creating appropriate institutions that would put to good use the potential for genuine motivation and detailed practical ecological knowledge of local communities. Several tentative moves have been made in this direction: joint forest management programmes, village level resource mapping, etc. These need to be consolidated, developed further and linked to the panchayati raj institutions.

This article presents and discusses an alternative programme of action which has been formulated as the People's Natural Resource Management Bill.

WE stand on the threshold of a potential revolution in the way country's natural resources are managed. We have arrived at this juncture for a variety of reasons. Last four decades have witnessed a process of development focusing on intensifying the flows of natural resources with large-scale state investments to benefit a narrow elite, while passing on the costs of environmental degradation to the masses. But over the decades democracy has slowly taken root in our soil, and with gradually increasing levels of literacy these disempowered people are beginning to make their voices felt. At the same time, costs of the highly wasteful, centralised, bureaucratic management of natural resources can no longer be accepted, especially in the increasingly competitive economic environment. Similar developments in other parts of the world, coupled to the new promises of biotechnology have forced all nations to take cognisance of the need to steer economic development on to a sustainable course and to protect the global heritage of biological diversity. This prompted adoption of the Agenda 21 for sustainable development and the signing of the international convention on biological diversity at the Rio Earth Summit in June 1992 [United Nations 1992a, 1992b]. These documents recognise the role of indigenous communities and women in prudent management of ecological resources and call on nation states to respect their traditions and practices and strive for more equitable sharing of benefits of use of natural resources, especially biological diversity with the local communities.

We have every reason to be proud that amongst the third world countries India is in the forefront of empowering people through democratic institutions, as witness the recent 73rd and 74th amendments to the Constitution [Ministry of Rural Development 1992a, 1992b]. India is also in the lead in revitalising institutions for involving local communities in the management of natural resources as manifest in the joint forest management programmes, in force in West Bengal since 1974, and formalised through

a central government circular in June 1990 [Deb and Malhotra 1993]. There have also been other significant initiatives such as the involvement of ryot sanghas, farmers' clubs in watershed development programmes in Karnataka. The spontaneous grass roots support to the literacy mission in many parts of the country, and the development of village-level resource mapping as a component of the post-literacy programmes by the Bharat Gyan Vigyan Samithi are pointers in the same direction [Zachariah and Sooryamorthy 1994:187].

India has a vibrant voluntary sector that has played a significant role in involving people in prudent management of environmental resources. The women of Chipko movement in Garhwal Himalayas continue to be active in ecodevelopment camps in the Alakananda valley [*Down to Earth*, April 30, 1993]. The farmers of the Sangli district of Maharashtra have worked with engineers to build the famous Baliraja dam and organise a system of equitable sharing of water resources on their own. Voluntary efforts have often concentrated simultaneously on health, education and environmental protection and restoration. The recent plague epidemic in India has also focused attention on the need for much more serious effort at people's involvement in maintenance of public health [*Down to Earth*, October 31, 1994].

Simultaneously, we are increasingly realising that working against nature will not help in the long run [Haila and Levins 1992]. We cannot indefinitely go on sucking out ground water while allowing the traditional small-scale irrigation works to get silted up. We cannot forever control mosquitoes through broadcast spraying of DDT for they will evolve resistant strains. We cannot go on cutting down species of rich rain forests and planting them with Eucalyptus for the monocultures will fall prey to the pink disease. We cannot go on multiplying the number of trawlers and purse seiners for the fish and shrimp stocks will be simply wiped out. Instead, we must work with nature, carefully fine-tuning our interventions, to

get the services we want as efficiently as possible without introducing excessive perturbations. Thus we must keep levels of fertiliser usage as low as possible through carefully monitoring soil conditions, helping it retain its natural store of organic matter and micro-organisms and then adding only the required nutrients at times geared to promote efficient uptake by crop plants. We must manage forests as far as possible by promoting natural regeneration of the multitude of indigenous species. We must deal with disease vectors like fleas and mosquitoes by controlling their breeding sites rather than by broadcast use of pesticides.

Such a programme of managing nature carefully by working with, rather than against it, calls for substantial inputs of information. For, in this instance, we are dealing with exceedingly complex systems highly variable in time and space. Detailed locality and time-specific information is therefore an essential prerequisite of any system of careful, prudent handling of natural resources and the public health environment. Such detailed information, continually updated is available only with farmers, graziers, fisherfolk and forest dwellers who depend on it for the success of their day-to-day subsistence activities [Gadgil, Berkes and Folke 1993:151-156; Gadgil 1994]. Moving towards an information-based management of natural resources will therefore have to depend on involving these practical ecologists in the management process. It is also these Indian masses living close to the earth who stand to gain most from a shift towards a regime of sustainable use of natural resources, maintenance of local diversity and of a healthy public health environment. But today they have little or no control over their local environment and have instead become instruments of abuse of the country's common property resources. The challenge before us then is to move towards a system of sustainable use of natural resources, conservation of biodiversity and maintenance of a healthy public health environment by creating appropriate institutions that would

put to good use the potential for genuine motivation and detailed practical ecological knowledge of local communities [Gadgil and Rao 1994:2103-2107; Antia and Bhatia 1993:394].

As mentioned above, several tentative moves have already been made in this direction, moves such as the initiation of the joint forest management programmes, extensive involvement of the voluntary sector in the literacy and drinking water missions, and the village level resource mapping programmes as a post-literacy activity. These moves need to be consolidated and appropriately linked to the countrywide set up of the panchayat raj institutions now being established. Unfortunately, the draft forest bill of 1994 makes little progress in this direction [Chhatre 1994:5-11; Hiremath, Kanwalli and Kulkarni 1994:280]. As a result, the voluntary sector organised a series of local and regional meetings to discuss this draft, culminating in a national conference in New Delhi between October 25-28, 1994 which opposed the draft. In response, Kamal Nath, the central minister for environment and forests called on the voluntary sector to come up with its own alternative draft [Indian Express, October 26, 1994]. The conference on the draft forest bill concluded by stating that it will collectively work towards incorporating the views of tribals and forest dwellers all over the country and will then present an alternative plan, programme and draft legislation of the people for ratification [Indian Social Institute 1994].

This article is based on a draft of what was termed as the 'People's Natural Resource Management Bill' which was submitted to the minister for environment and forests at this conference as a beginning towards the development of an alternative. This alternative was extensively discussed on October 26 and 27, 1994 at this conference, as also circulated widely in different parts of the country. This has generated extensive, useful and detailed suggestions. The purpose of this paper is to present a version of the alternative draft revised fully in the light of these suggestions in the hope that it will help take further the process of development of a viable alternative plan, programme and legislation.

THE APPROACH

The current bureaucratic regime has greatly fragmented the control over and management of the country's natural resources amongst revenue, forest, irrigation, public works, public health and other departments. It has also established a bureaucratic monopoly over all information pertinent to environmental management treating the practical ecological knowledge of the people as irrelevant and providing no

role for the extensive network of schools, colleges, universities and research institutes of the country in this process. We visualise instead that all public lands and waters will be managed in an integrated fashion in conjunction with the privately controlled lands and waters in any locality with the three-fold objectives of sustainable use of natural resources, conservation of biological diversity and maintenance of a healthy public health environment. We also visualise this process as involving local communities as the principal actors, and being based on careful use of locality specific information through extensive involvement of local schools, colleges and research institutions. The panchayat raj institutions must play an important role in this process. But the coverage of the lowest level panchayats is still too extensive to do justice to the highly locality-specific task of managing natural resources. The proper basic units for such a task will have to be individual hamlets, settlements or villages. We therefore visualise 'Village Nature, Health and Education Committees' (VNHEC) as the foundation on which the environmental management of the entire country would be built up through a bottom-up process. These institutions are also expected to play an important role in more effective management of public health, and revitalisation of the educational system by linking it closely to first hand experience of local environment and development issues. These village-level institutions will have to be properly linked to the panchayat raj institutions at village cluster, taluk and district levels.

In place of the incredibly fragmented bureaucratic system, we instead propose two basic regimes of environmental management: a supply regime for fulfilling the natural resource demands of the local people, as well as the larger economy, and a safety regime focusing on provision of ecosystem services and conservation of biological diversity. We must also create a system of positive incentives to ensure maintenance of high levels of biodiversity in the supply regime especially through protection of smaller safety zones, and provision for basic needs of people in the larger safety sites. We therefore visualise management of the entire landscape and waterscape of the country as a mosaic of supply sites and safety sites. This will have to be a co-management between local communities and the larger society and the larger society will especially have to help through the support of nature protection squads, help in conflict resolution and provision of technical inputs.

THE FRAMEWORK

1 Elements of land and water in any particular locality are linked together by flows of energy and material as well as by

human resource use and are an integral part of the overall ecosystem of the region. Long-term sustainable management of these resources calls for an integrated and decentralised approach. The basic unit of such a system of decentralised, integrated management should be a village/hamlet/settlement.

2 The current fragmented system of management of public lands and waters should be replaced by a system based on reclassification of these lands and waters into safety sites and supply sites. The larger safety sites shall primarily consist of existing protected areas and areas with dense forest cover, low population density and a high proportion of tribal population. They shall also include ecologically significant areas in sea, rivers and wetlands. The remaining public lands and waters shall form supply sites for fulfilling the natural resource demands of the people and the larger economy. A series of much smaller safety zones embedded in the supply sites would complement the larger sites. The management of safety sites will focus on provision of ecosystem services and conservation of biodiversity with adequate provisions for fulfilment of the basic needs of the local people. A system of positive incentives should be created to promote maintenance of high levels of biodiversity in both supply and safety sites.

3 All state controlled natural resources within the territorial limits of a unit of management such as village/hamlet/settlement, whether classified as supply or safety sites should be the collective property of the local community. The community should enjoy rights over all biomass, minerals, rocks and intellectual property rights pertaining to knowledge of uses associated with these lands and waters. The community shall have an advisory and supportive role in management of private property as well. Enjoyment of these rights shall be linked to continued good management of these resources and adherence to certain norms by the community. Such norms should aim to protect long-term interests of the community, as well as of the ecosystems, promote equitable sharing of benefits especially with the weaker sections and incorporate a system of performance based rewards.

4 The village community level institutions involved in the management of natural resources should be simultaneously responsible for a comprehensive system of primary health care under decentralised management to replace the current system of primary health care. These institutions should look after all the promotive and preventive health care services, as well as organise certain curative aspects of primary health care needing simple skills and facilities for diagnosis, management and

care. It should work closely with NGOs that are already providing these services or are willing to do so. These institutions should take full advantage of local human and veterinary health traditions. The village community should share control with the government over the health care delivery system and contribute towards its operational costs.

5 The village community institutions involved in the management of natural resources and public health should also be responsible for primary, secondary, vocational and non-formal education. Both the formal and non-formal systems of education at the village level should have significant components of interactive learning with the students and teachers involved in monitoring the status of local environment and public health situation. Such efforts in monitoring and preparation of management plans for local environment and health care, along with technical information from departments of agriculture, horticulture, animal husbandry, soil conservation, forestry, fishery, public health, etc., should provide the learning situation and material for adult education. Vocational education should be designed to fit the local needs, infrastructure and natural resource availability with substantial inputs from the local community. The village community should make the fullest use of the information gathered through monitoring as an integral component of the educational process for devising plans for the management of natural resources and public health.

6 The 'grama sabha' of the village should be considered as the owner of all natural resources in the public domain within its territory and the final decision-making body in management of natural resources, health and education. Benefits flowing from the utilisation of natural resources should be equitably shared amongst members of grama sabha. Such benefits may be treated as tradeable but a person's share in the collective property is to be considered as inalienable. An elected or selected body termed as the Village Nature, Health and Education Committee (VNHEC) should function as a trustee for management of this collective property. It should serve as the executive body implementing the decisions of the grama sabha and management plan prepared by it. The VNHEC should have adequate powers to regulate access by outsiders, as well as group members, and to make the needed operational rules for management, and equitable sharing of benefits. The VNHEC should prepare plans for management of natural resources, health and education with participation and approval of grama sabha. These village-level plans should form the basis of a larger regional plan incorporating management plans of other villages.

7 The government departments should not have a monopoly over executing works in the management plan, but should have to compete with private agencies and grama sabha members in winning contracts to do so. The VNHEC should closely monitor the implementation of such works and should have the powers to withhold payment in case of improper execution of works.

8 Several functions can be efficiently performed only at larger spatial scales above the village level such as taluk, district, or nation. For this purpose, representative committees should be formed at higher levels involving NHEC representatives from the preceding levels as members. Such committees should aid and support VNHECs in the following functions: (a) Co-ordinate management of contiguous patches of forests, water bodies, hill ranges belonging to individual VNHECs, (b) Organise sharing of indivisible, fugitive resources like surface and ground water, natural biological populations based on traditional arrangements and current requirements, (c) Deal with transboundary issues such as downstream influences and prevention of offences, (d) Disburse funds to VNHECs and also receive payments for certain services rendered by them to the larger society like conservation of biodiversity, monitoring of status of contagious diseases and vectors and participatory environmental impact assessment, (e) Ensure redressal of grievances of weaker sections and protection of their interests, (f) Organise evaluation of performance of individual VNHECs by an independent agency and allocation of funds on this basis, (g) Resolve disputes amongst lower level committees, (h) Provide advice and facilities to ensure that VNHECs get a fair price for market transactions involving surplus biomass, rocks, minerals and intellectual property.

9 These institutions should function in close co-ordination with panchayat raj institutions at village cluster, taluk and district levels and with state and central governments. They should include the elected members of such bodies at the respective levels along with VNHEC representatives. VNHEC should have primacy in all aspects of ownership and management of its collective property unless it violates the norms to be established by the district level panchayat body.

10 Currently, natural resources, health and education are separately managed in a centralised manner by various government agencies and departments. The role and powers of these government agencies will be so redefined as to support the activities of VNHEC and be a part of an integrated, decentralised process of planning, implementation and management of natural resources, health and education. The development departments concerning natural

resources like forest, agriculture, horticulture, animal husbandry and fisheries, etc., should provide technical expertise and training. They should be one of several possible implementation agencies for the management plans prepared by the VNHEC and consolidated at panchayat level. Relevant departments concerned with law enforcement regarding natural resources like forest, revenue, pollution control, coast guard, etc., should depute their officers to form a nature protection squad. Control over and maintenance of such nature protection squad shall be shared by district level NHEC body and the state government.

11 Environmental offences shall be defined in light of the norms and laws at state and national level. However there should be enough flexibility allowed at various levels to define offences and penalise offenders to suit the local context. The scope of the offences should be widened to include pollution, and commercial overexploitation.

12 Adequate provisions should be made for protection of interests of weaker sections by providing forums for redressal of grievances at appropriate levels. All activities of VNHEC and higher committees should come under the purview of the sub-committee on welfare of weaker sections of the respective panchayat bodies and other relevant institutions at state and national level.

13 All conflicts between NHECs should be resolved by higher committees only. Nyaya panchayats should be constituted at panchayat level as per Karnataka 1983 Act with all activities of VNHEC and panchayat level NHEC body within its jurisdiction. From taluk level upwards appropriate legal courts should perform this function. Special benches should be constituted for speedy disposal of cases.

14 Continuous monitoring of status of natural resources, health and education with special reference to status of contagious diseases, population levels of crop pests, vectors and pathogens of humans and livestock diseases is essential for proper planning and efficient implementation. Such an effort should become a part of the interactive learning process in both formal and non-formal education and help in increasing the general level of awareness amongst people.

15 Allocation of funds to VNHEC should be based on the performance as evaluated by the local pre-university and college students and teachers. Parameters for evaluating performance of VNHEC should be defined and weights assigned to each parameter for management of natural resource, health, education at state level and for conservation of biodiversity at the national level. The payments to VNHECs will be enhanced with good performance and withheld in case of very poor

performance. Persistent bad performance should result in the takeover of the management of the VNHEC by higher level bodies until the VNHEC can ensure good performance. There should be internal auditing and evaluation of performance to scrutinise the utilisation of funds by VNHEC and higher bodies. There should be no auditing by the government.

16 Livelihood and culture of tribals is closely inter-linked with forests. Livelihood of traditional fisherfolk and nomadic graziers and shifting cultivators may depend on access to resources across territories of several village communities. The new collective property regime under VNHEC is likely to increase their cost of resource gathering and bring uncertainty in contractual arrangements made with individual VNHECs. The interests of such special groups should be adequately protected.

17 There should be a National Environmental Commission consisting of VNHEC representatives, NGOs and scientists functioning as an independent authority to: (a) adjudicate over matters affecting natural resources, public health, pollution, displacement of people by development projects, commercial exploitation, etc; (b) continuously monitor status of environment and health at the national level.

18 Adequate access to and dissemination of information is crucial to the success of the NHEC system. All VNHEC members and NHEC functionaries should have full right of information regarding any activity of NHEC at all hierarchical levels. Grass roots level awareness of provisions of this bill, status of natural resources, health, management plans, budget allocations evaluation reports of VNHEC, working of higher committees are important for success of the programme.

19 The system envisages involvement of several institutions including NHECs at various levels of hierarchy, people's elected representatives, government departments, NGOs and commercial interests in management of natural resources, health and education. Under such a set up, it is important to ensure that the balance of power favours VNHEC and panchayat level institutions.

20 As the NHEC system is based on democratisation and decentralisation of power across the board, it is bound to face resistance from certain sections of government and vested interests and initial apathy from people. For, it to be successful, it has to be built up as a people's movement, with successful implementation of the system a part of the grass roots political agenda.

21 Decentralisation of powers down to the village settlement levels would undoubtedly permit the dominant social elements at such levels to exert their influence. The system

provides several checks and balances to minimise the distorting effects of such influences. In the more open, transparent processes thus visualised, the role of these influences should in any case be reduced in comparison with the role they can play in the current system.

The Bill

FORMATION OF VNHEC AND HIGHER COMMITTEES

1 Awareness of the Bill and Opportunities Offered to People:

1.1 It is necessary to create awareness at village level especially amongst weaker sections about provisions and opportunities offered under this bill. This should be attempted prior to initiating any of the processes envisaged under this bill.

1.2 Such a programme should be built along the lines of the National Literacy Campaign with active involvement of NGOs, local schools and colleges and local people. This should involve posters, information brochures and setting up permanent notice boards to display relevant information in prominent public places.

2 Formation of Village Committees:

2.1 Prior to the first meeting of grama sabha (assembly of all individuals of 18 years or above in the village or hamlet) for the formation of VNHEC sufficient notice and publicity should be given regarding its purpose, venue and date. Invitations should be sent to each family of the village and acknowledgement of receipt obtained. Similar procedures shall be followed for all subsequent meetings of grama sabha by VNHEC.

2.2 The unit of VNHEC can be a revenue village, hamlet or tribal settlement. The decision as to the appropriate unit to be selected should be arrived in the meetings of the various grama sabhas within the jurisdiction of a panchayat. Organising a grama sabha as specified in 2.1 is the joint responsibility of the panchayat members, school teachers, local NGOs and the concerned revenue department functionary. This grama sabha shall be chaired by the president of the panchayat.

2.3 Members of VNHEC shall be selected/ chosen by consensus in the grama sabha. The number and composition of such members is specified in section 25.6.

2.4. In case of a lack of consensus in grama sabha regarding selection of members of VNHEC, elections shall be held as per section 26.3.

2.5 During the initiation of this process of VNHEC formation the higher committees above VNHEC would not have been constituted during elections for VNHEC. In

such a case, only the president of VNHEC and its representatives to PNHEC shall be elected by grama sabha. The elections should be supervised by the taluk panchayat body.

2.6 The entire expenses of such elections to VNHEC shall be deducted from its funds of component C as specified in section 13.1.

3 Qualifications for Membership:

3.1 The VNHEC members shall have a term of office equivalent to gram panchayat and the process of selection/election of members be staggered by at least one year with respect to that of panchayat elections.

3.2 Existing members of panchayat raj institutions, state legislative, or co-operative institutions shall not be selected/elected as VNHEC members. Any sitting member of VNHEC shall lose the membership in case of acquisition of any of the memberships mentioned above.

3.3 VNHEC members should be permanent residents of the village and should not hold any transferable jobs either in private or public sector.

4 Formation of Higher Committees:

4.1 The higher committees shall be formed in a sequential manner at panchayat (PNHEC), regional (RFN), taluk (TNHEC), district (DNHEC), state (SNHEC) and national (NNHEC) level with membership as indicated in Table 1.

4.2 Each committee shall select or elect its representative(s) for the next higher committee. Only VNHEC members shall hold the office of the president up to district level and acting vice-president at state and national level.

4.3 The representatives to higher committees, as well as the president/vice-president shall be recalled by 2/3 majority vote of the electorate.

5 Functioning of Higher Committees:

5.1 All the Nature, Health and Education Committees (NHECs) shall have their permanent offices in appropriate administrative headquarters. Such committees shall meet at least once every month for PNHEC and TNHEC, every two months for DNHEC, every four months for SNHEC and every six months for NNHEC. An extraordinary meeting can be called either by president or 1/3rd of members at a minimum notice of a quarter of this period to all members.

5.2 For NHEC committee meeting the quorum shall be the presence of at least half of its voting members. Such members shall lose membership for absence in two consecutive meetings without prior information and valid reasons for doing so.

The non-voting members can be absent with prior permission and only after deputing a suitable person in their place.

5.3 The NHECs should have power to summon any relevant government official or examine any relevant record within its area of jurisdiction by giving adequate written notice.

5.4 All proceedings and records of NHECs shall be open to public scrutiny and copies shall be provided on payment of duplication charges.

5.5 Allowances and facilities for NHEC members shall be equivalent to those of the elected members of panchayat bodies, state legislature and parliament at corresponding levels. The expenses in this regard shall be met by DNHEC funds till district level. At SNHEC and NNHEC level it shall be funded by state and central government respectively.

5.6 They shall operate in conformity with the provisions of sub-committee on welfare of weaker sections of panchayat bodies and other mechanisms for protection of weaker sections formulated by state government.

6 Nature, Health and Education Committee as a People's Movement:

6.1 As the NHEC system envisages decentralisation and democratisation of power in various sectors it is bound to face resistance on various fronts from certain

sections of government, vested interests and initial apathy from people. For NHEC to be successful, it has to be a people's movement with adequate protection to interests of weaker sections of society.

6.2 While legislation and policies are absolutely necessary for the functioning of NHEC system, they are by no means sufficient conditions. Protection of interests of weaker sections, preferential or increased allocation of benefits to poor, protection of livelihoods of groups of people dependent on grazing, shifting cultivation, non-timber forest produce, inland fishing, etc. cannot be ensured by rules alone.

6.3 NGOs should take up this challenge and strive to: (a) create awareness amongst people about provisions of the NHEC system; (b) ensure transparency and accountability in NHEC; (c) make the issues of section 6.1 as social norms of people; (d) make successful working of NHEC system as a political agenda at the grass roots level democratic institutions.

6.4 TNHEC shall promote this by constituting NGO watchdog committees from active local NGOs.

6.5 The elected/selected president of NGO watchdog committee shall attend all NHEC meetings from TNHEC level onwards. Issues raised by him shall be answered within 10 days by the relevant NHEC president. Each such committee shall select/elect one representative to the NGO

watchdog committee for the next higher level in the hierarchy.

THE VNHEC

7 Delimitation of Boundaries of VNHEC:

7.1 As delimitation of boundaries is a complex task and can get contentious, it shall be carried out by PNHEC and TNHEC with the help of NGOs and concerned VNHECs.

7.2 To the extent possible, village revenue boundaries shall be used for this purpose. However, existing rights and privileges in resource catchments, i.e. areas outside revenue boundaries from which people are used to meeting their biomass and other natural resource needs also have to be considered.

7.3 In case of two or more VNHECs sharing a single resource catchment like a forest patch, grazing lands, etc. an attempt shall be made to arrive at a mutually agreeable consensus to the extent possible.

7.4 Attention should be paid to the traditional rules and conventions governing the sharing of such resource catchments especially with respect to water bodies like ponds, rivers and sea by two or more communities. In the event of dispute decision shall be given by TNHEC as per section 21.

7.5 VNHECs sharing a continuous resource patch as in section 7.3 or indivisible resources like ground water and streams

TABLE 1: SUGGESTED NORMS FOR MEMBERSHIP AND OFFICE BEARERS OF NATURE, HEALTH AND EDUCATION COMMITTEES AT DIFFERENT HIERARCHICAL LEVELS

	Village	Panchayat	Taluk	District	State	Country
VNHEC members	Elected/selected by grama sabha	Two representatives from each VNHEC at least one being a woman	One representative from each PNHEC	One representative from TNHEC	One representative from each DNHEC and SSA	One representative from each of SNHEC and SSA extending across states
Elected representatives	-----	Members of gram panchayat	Members of taluka panchayat	Members of zilla parishad	Members of state legislature	Members of parliamentary committees concerning nature, health, education
President	Elected by grama sabha	VNHEC members elected by PNHEC	VNHEC members elected by TNHEC	VNHEC members elected by DNHEC	Chief minister of the state	Prime minister of the country
Vice-President	Elected by grama sabha	VNHEC member elected by PNHEC	Any voting members of the TNHEC	Any voting member elected by DNHEC	VNHEC member elected by the SNHEC	VNHEC member elected by the NNHEC
Secretary	Village education worker	Panchayat secretary	Taluk panchayat secretary	District panchayat body secretary	Development commissioner of the state	Secretary, environment
Departments concerning natural resources	-----	Village level functionaries	Taluk level functionaries	District level department head	Department secretaries	Department secretaries
Health	Village health worker	Panchayat level functionary	Taluk level functionaries	District level department head	Department secretaries	Department secretaries
Education	Village education worker	Panchayat level functionary	Taluk level functionaries	District level department head	Department secretaries	Department secretaries
Nature Protection Squad	-----	One deputed member	Taluk level officer of the Nature Protection Squad	District level officer in charge	State level officer in charge	National level officer in charge
NGO committee	-----	-----	One member	One member	One member	One member
Evaluation committee	-----	-----	One member	One member	One member	One member

Note: At each level the VNHEC members should constitute 75 per cent or more and elected representatives 25 per cent or less of the voting members.

shall be subject to the authority of a federation of all such VNHECs as per section 19.

8 Accrual of Property Rights:

8.1 After delimitation of territories the boundaries are to be demarcated conspicuously and permanently. A permanent record is to be made consisting of location map of boundaries, land survey numbers and area of each of the survey number involved. Special attention should be paid to boundaries in water bodies and their satisfactory demarcation ensured, based either on traditional practices or any other appropriate method.

8.2 The boundaries thus fixed shall be altered only under certain special circumstances. The entire public lands and waters within the territory as declared in section 8.1 and benefits accruing from minerals, rocks and living organisms like plants, animals, micro-organisms in it, including intellectual property rights (IPR) relating to knowledge of uses of living organisms, shall be deemed as the collective property of the grama sabha.

8.3 Notwithstanding anything said anywhere else enjoyment of the collective property rights under section 8.2 shall be subject to certain conditionalities prescribed by DNHEC as per section 25. Records regarding the territories of VNHEC shall be deposited with PNHEC and TNHEC.

8.4 The share of the collective property to any member of grama sabha is inalienable and shall not be traded. However, the specific benefits accrued to a member are tradeable.

8.5 The existing privileges in the public lands and waters shall continue under the new regime of collective property. The privileges shall be reviewed by DNHEC as per section 29.2.

9 Bench-mark Survey on Status of Nature, Health and Education:

9.1 This process shall be initiated by PNHEC. It shall involve closely all the VNHEC members, volunteers from local people, teachers and students of local school and NGOs.

9.2 The survey shall make use of and also record practical ecological knowledge of local people. The parameters for status on natural resources, health, education shall be specified as per procedures and formats indicated in section 26.1. Such a process shall involve simple techniques of data gathering.

9.3 Findings of such a survey shall constitute a 'community register' which shall be treated as a permanent record of VNHEC. It shall be updated based on annual evaluation reports of VNHEC and copies sent to PNHEC and TNHEC. Any unauthorised alterations shall be considered an offence under section 33.1.

10 Preparation of Management Plan and Recruitment of Staff by VNHEC:

10.1 After preparation of community register the VNHEC shall prepare a comprehensive management plan regarding natural resources, primary health care and education within its jurisdiction. Such a plan shall be prepared, and shall also have the approval of one or more meetings of grama sabha called for this purpose.

10.2 The grama sabha shall appoint village health worker (VHW)(s) and village education worker (VEW)(s). It shall also appoint other staff necessary for management of natural resources. Such staff shall receive training as per section 20.2 and be subject to service rules as per section 26.5.

10.3 The management plan shall include the following: (a) Measures needed for development/improvement of natural resources, village sanitation, primary health care and formal, non-formal and vocational education. It shall also specify prioritisation of works to be taken up for implementation; (b) Physical works to be carried out like soil and water conservation, village sanitation, drainage, afforestation, etc. shall be clearly indicated on the map and plan and estimates made for them; (c) It shall identify as safety zones certain areas suitable for conservation like water-sheds, pristine areas including those in sea and wetlands, and sacred groves. It shall specify measures to promote and conserve biodiversity in both public and private lands as well as waters. Such efforts shall include individual efforts in conservation like cultivation of local cultivars, maintenance of wild relatives of cultivated plants/animals; (d) Decision of VNHEC shall be final regarding the plan in case of any dispute with PNHECs or RFN, provided it does not violate section 25; (e) This plan shall also take into account outside pressures like commercial demand, pollution effects, and nomadic graziers.

10.4 The management plan shall be incorporated into a larger regional plan by PNHEC preferably on a watershed basis. It shall decide on the works to be taken up and suitably allot funds of component M of VNHEC as per section 13.4. Government departments like PWD, soil conservation, etc. shall not have a monopoly in carrying out these works and shall compete with grama sabha members and private agencies for contracts for the works.

10.5 The payments for works executed shall be made by the committee handling component M as in section 13.4: (a) It shall, if necessary appoint a monitoring committee of grama sabha members to supervise the implementation of works; (b) It shall withhold payments for unsatisfactory completion/quality of works.

11 Functioning of Village Health Worker:

11.1 The VHW(s) shall perform the following functions along with any other functions assigned by grama sabha from time to time: (a) Provide treatment to certain categories of ailments as per section 37.4 and Table 3 and refer other ailments to the Primary Health Centre and Community Health Centre. She/he shall maintain records of the patients treated or referred; (b) Assist grama sabha in planning for village sanitation and public health, conservation of medicinal plants and utilisation of local health traditions and monitor implementation of these programmes; (c) Create awareness regarding family planning, maternity care, nutrition by involving local people/NGOs, local teachers/students in periodic monitoring of health status and campaigns. She/he will ensure that trained dais provide adequate maternity care; (d) She/he shall maintain records and carry out monitoring of status of communicable diseases, vectors, stomach worms, drinking water and other relevant health parameters; (e) She/he shall involve local village education worker(s), school teachers/students, local health practitioners and other volunteers in monitoring the health status of the people as well as public health related aspects of the environment.

12 Functioning of Village Education Worker (VEW):

12.1 VEW shall function as the secretary to VNHEC and shall perform the following duties along with others assigned by grama sabha.

12.2 Send invitations for and give publicity about grama sabha meetings and training programmes.

12.3 Maintain relevant records of VNHEC like community register, management plan.

TABLE 2: APPROPRIATE LEVEL OF NATURE, HEALTH AND EDUCATION COMMITTEE FOR DECIDING UPON REGULATIONS, OFFENCES AND PENAL PROVISIONS

	Responsibility
Village	Operationising the management plan
District	Norms to be followed by DNHEC, TNHEC, PNHEC
State	False claims, corruption, mis-appropriation regarding component M, protection of interests of weaker sections, formation of VNHEC, external impacts affecting interests of VNHEC, demands on biomass from urban areas and commercial interests
Country	Intellectual property of VNHEC and its members' false claims, corruption relating to component C, co-ordination between various SNHEC laws

proceedings of VNHEC, budget allocations, etc.

12.4 Co-ordinate the implementation of extension activities of development departments and vocational training.

12.5 These records and technical inputs shall form the learning situation for adult literacy programme. Along with a team of volunteers, she/he shall run the adult literacy programme and work with the local school teachers and students in monitoring the parameters of natural resources and education.

12.6 Formulate a vocational training programme for the village and ensure that such trainees get continued support from PNHEC and TNHEC.

12.7 Both VEW and VHW shall receive periodic training as per section 20.2. They shall receive payments from PNHEC from component M of VNHEC subject to recommendations of grama sabha.

13 Handling Finances:

13.1. There shall be a fund called VNHEC fund and it shall receive the money from following sources: (a) All proceeds from sale, auction and appropriation of benefits from the property in its territory as in section 8.1; (b) From certain taxes levied and fees as decided by it; (c) Payments from National Environment Fund as Component C or service charges as per section 32. The quantum of these funds shall depend on services performed with respect to conservation of elements of biological diversity, participatory environmental impact assessment, monitoring of disease vector populations, etc.

13.2 This VNHEC fund shall be deposited in the nearest bank or post office and the accounts shall be operated jointly by two VNHEC members nominated by grama sabha one of whom shall belong to weaker sections. 13.3 VNHEC funds shall be treated as untied funds and can be allocated in any way deemed fit by VNHEC. Grama sabha shall have full knowledge of the extent and allocation of VNHEC funds and all records have to be presented in its meeting. PNHEC also has an advisory role in allocation of VNHEC fund and shall receive a copy of dealings regarding VNHEC fund.

13.4 Funds sanctioned by DNHEC for the management plan prepared by VNHEC referred to as component M shall be vested with PNHEC. It shall be deposited in the nearest post office/bank and shall be operated by president of gram panchayat, representative of VNHEC in panchayat and operators of VNHEC fund.

14 Working of VNHEC:

14.1 The VNHEC shall function as the trustee to manage collective property of grama sabha. It shall carry out the management plan and other decisions of grama sabha. It shall have sufficient powers to ensure effective

management of natural resources, health and education.

14.2 It shall design appropriate operational rules for usage and appropriation of benefits from collective property of grama sabha and implementation of management plan in general.

14.3 It shall ensure proper functioning of VEW and VHW and receive complaints regarding their functioning.

14.4 It shall share control over all facilities of primary, secondary, non-formal and vocational education and primary health care within its jurisdiction and ensure their proper functioning.

14.5 It shall organise grama sabha on a regular basis of at least once in 2 months to be chaired by either the PNHEC chairman or the VNHEC representative to it. All the details of various activities of VNHEC shall be placed before it and discussed.

14.6 It shall participate in environmental impact assessment of development projects and pollution causing industries affecting them as per section 30.

14.7 Certain groups like nomadic graziers, fisherfolk, shifting cultivators, artisans depend on *de facto* open access to government-owned lands and waters across resource catchments of several villages for their livelihood. Under the new collective property regime of VNHEC the costs of obtaining such access would increase and the informal arrangements made amongst themselves and as well as with the villagers would be put on uncertain footing. VNHEC shall take cognizance of these issues and make suitable provisions in the management plan.

15 Prevention of Offences and Law Enforcement:

15.1 VNHEC shall also decide on what actions constitute an environmental offence and take effective measures to prevent it as per Table 2. Provisions of section 25 supersede this section.

15.2 VNHEC shall devise mechanisms for prevention of offences as declared in section 15.1 which can include: (a) Formation of village defence committees as in the Indian Penal Code; (b) System of rewards for information/apprehending offenders; (c) Organise checks along roads and paths on to the forest patch; (d) Regulate harvest of timber/forest produce/fish/grazing pressure/NTFP extraction. (e) Any other measures found suitable/needed.

15.3 The burden of proof of there being an offence shall be on the VNHEC and it can levy a fine or any other punishment deemed fit under section 15.1. The offender under section 15.2 shall have recourse to an appeal to Nyaya Panchayat under section 18.2 within 7 days of receiving a verdict from VNHEC.

15.4 VNHEC shall request the help of Nature

Protection Squad constituted as per section 33.3 through PNHEC for prevention of offences, and help in law enforcement. Such requests should be in the written format specifying nature of help, location and duration for which it is required.

15.5 VNHEC shall make efforts to give publicity to the information on environmental offences and punishments for such offences.

PANCHAYAT NATURE, HEALTH AND EDUCATION COMMITTEE

16 Working of PNHEC:

16.1 It shall function as a sub-committee of the Panchayat and enjoy autonomous powers unless it violates the DNHEC norms and provisions of panchayat sub-committee on weaker sections.

16.2 From the individual management plans of VNHEC it shall prepare a panchayat level management plan integrating into such plan prescriptions for all the areas over which it has control under 11th schedule of 73rd constitutional amendment act 1993.

16.3 Members from Nature Protection Squad set up as per section 33 shall attend the PNHEC meetings and be available constantly for specific PNHECs to accept written complaints and to take necessary

TABLE 3: APPROPRIATE AUTHORITY FOR SUPERVISION OF HEALTH FACILITIES

NHEC	Responsibility
Village	Village health worker, trained dais, local health practitioners
Panchayat	Primary Health Centre
Taluk	Community Health Centre

Notes:

Primary Health Centre (PHC): to be located at headquarters of PNHEC. Should provide major facilities like outpatient care chiefly of referral nature, inpatient services like medical, minor surgery, sterilisation operations, moderate risk cases of delivery, first aid and referral for services requiring further medical care. It shall have two MBBS doctors, one preferably female and an additional doctor trained in the indigenous system of medicine along with other necessary staff and equipment.

Community Health Centre (CHC): Health care facility with at least one being located at TNHEC headquarters headed by a doctor with post-graduate training in medicine preferably in preventive and social medicine. She/he should be assisted by specialists consisting of physician, surgeon, gynaecologist, paediatrician and anaesthetist with adequate supporting staff, facilities and transport. Major functions consist of providing backup for all curative problems beyond skill and facilities at PHC, providing high level of medical and surgical care for problems referred by PHC or VHW, maintaining close liaison with PHC and providing consultancy services and periodic training for VHWs.

action. The exact strength of such members assigned to PNHECs shall be decided upon by TNHEC.

16.4 All the funds received for the management plan of VNHEC shall be controlled jointly as per section 13.4. The funds received as service charges shall be handed over to VNHEC.

16.5 It shall ensure proper evaluation of VNHEC by a team appointed by TNHEC and as well as internal auditing as per section 23.2. It shall send the reports to TNHEC and be responsible for their authenticity along with the evaluating agencies.

16.6 It shall make payments to VEW and VHW as per grama sabha recommendations and to evaluating agencies as per DNHEC norms.

16.7 It shall share control over all educational and health facilities provided for as per SNHEC decisions in section 37.4.

16.8 It shall arrange for vocational education as per PNHEC management plan and also provide market, technical, credit linkages for trainees at panchayat level itself.

16.9 It shall initiate participatory environmental impact assessment as per section 30 by VNHEC.

16.10 It will undertake all activities to support functioning of VNHEC and any other tasks assigned by DNHEC.

17 Monitoring and Evaluation:

17.1 PNHEC shall make payments for students/teachers, people from village community who are involved in the initial bench-mark survey and continuous monitoring of natural resources, health and education.

18 Conflict Resolution and Redressal of Grievances:

18.1 It shall refer all disputes between VNHECs to TNHEC and shall carry out delimitation of boundaries for VNHECs.

18.2 Any grievances shall be referred to Nyaya Panchayats which shall be set up as per Karnataka Mandal Panchayat and Nyaya Panchayat Act 1983. Such grievances can also be referred to all relevant forums and panchayat level sub-committee on weaker sections.

REGIONAL FEDERATION

19 Functioning of RFN:

19.1 Whenever control over a physically continuous patch like a forest, hillock, or pond happens to be under more than one VNHEC belonging to different PNHECs such regional federations shall be formed.

19.2 Such RFN shall consist of presidents of constituent VNHECs and representatives of Nature Protection Squad and NGOs.

19.3 It shall ensure that the measures taken under management plan and prevention of environmental offences shall not adversely affect the operation of other adjoining VNHECs.

19.4 It shall ensure co-ordination and close co-operation amongst its members especially in sharing indivisible resources like ground water, streams, natural biological populations like wild life, etc.

19.5 The president of RFN shall be elected by the constituent VNHEC presidents. In case of failure to implement sections 19.3 and 19.4 he shall seek the intervention of TNHEC.

19.6 Certain groups like migrant graziers, artisanal fisherfolk and non-timber forest produce collectors though residents of a particular village/hamlet/settlement depend for their livelihood on free and/or subsidised access to resources over large tracts extending over several villages or even districts in certain cases. The representatives from such groups should form one or more regional federations (RFN) at an appropriate level at or below the district level as per section 25.6.

19.7 The president of such an RFN shall be elected/selected by the representatives. He/she shall seek to protect the interests of his/her constituents such as migrant graziers, traditional fisherfolk, non-timber forest produce collectors as the case may be.

TALUK NATURE, HEALTH AND EDUCATION COMMITTEE

20 Supporting Activities of TNHEC:

20.1 TNHEC shall provide all technical support like maps, instruments, training needed for benchmark survey, monitoring and evaluation of health, education and natural resource parameters in co-ordination with technical cell of DNHEC.

20.2 It shall train VEW and VHW periodically, provide for vocational training as per PNHEC management plan, also extend technical and market linkages through relevant institutions at taluk level.

20.3 It shall share control with all relevant departments over health care facilities and educational institutions up to pre-university level and ensure that they function as per PNHEC management plan and DNHEC norms.

21 Allotment of Territories to VNHEC:

21.1 TNHEC shall decide on partitioning of territories in case of disputes between VNHECs by considering population, biomass demand of contending parties, status of resource catchment, existing conventions and rules of use.

21.2 The criteria for allotment of territories shall be worked out by DNHEC. It shall also

outline the procedures to ascertain such criteria in the field.

21.3 The decision given by TNHEC shall be open to appeal to DNHEC. However, decision by DNHEC shall be final and binding on the parties.

21.4 TNHEC shall take the final decision on sharing or management of indivisible resources between VNHECs like streams, ground water, wildlife, etc, or in dealing with claims of migrant graziers, artisanal fisherfolk, non-timber forest produce collectors. This shall be done either in case of an appeal by relevant RFN of such groups, concerned VNHECs or RFN president.

22 Working of TNHEC:

22.1 It shall have in its deposition the records of collective property rights of all the VNHECs, management plans of PNHEC and VNHEC, evaluation reports of all VNHECs. It shall store all the information in the community register in a preferably computerised data base. Such information shall be updated every year.

22.2 It shall also maintain a counter in the local college/high school to receive inputs for community register. Such information shall have to be verified by annual evaluation committee of the concerned area.

22.3 It shall promote maintenance of specimens of elements of biodiversity in colleges and pay special attention to *in situ* conservation of biodiversity in VNHECs.

22.4 It shall identify VNHECs with poor performance and pay special attention to improving their working through the respective PNHECs. On persistent poor performance (2 consecutive years) it can take over such VNHEC under section 27.2.

22.5 It shall exercise punitive powers with respect to offences regarding monitoring and evaluation, corruption charges against VNHEC, PNHEC, and Nature Protection Squad members and take necessary action under section 27.2.

22.6 The TNHEC shall have a nodal centre of the National Informatics Centre Electronic Network, NICNET, which is currently at district level. This shall be used for communication with higher committees, to send time bound information on status of communicable diseases, population of vectors, etc.

23 Monitoring and Evaluation of VNHECs and PNHECs:

23.1 It shall exercise operational authority in appointment of evaluation committees for VNHECs from students and teachers of local pre-university and under-graduate colleges and NGOs.

23.2 It shall depute up to 7 members of PNHEC as internal auditors to PNHEC.

They shall be chosen on a lottery basis during the regular meeting of TNHEC. Each PNHEC shall undergo such an audit at a minimum of once in 2 years as per section 26.4

23.3 It shall prepare an abstract of performance evaluation reports of PNHEC regarding performance of individual VNHECs with respect to management plan (component M) as also conservation and promotion of biodiversity (component C).

23.4 Based on evaluation reports and internal auditing it can recommend to DNHEC every year 5 VNHECs for rewards which shall go to their component C. Based on such reports, it shall also accord non-material rewards like titles or certificates to honour either persons/VNHECs with exceptional contributions in these efforts.

24 Conflict Resolution and Redressal of Grievances:

24.1 It shall resolve conflicts between PNHECs and VNHECs and conduct necessary investigations after obtaining evidence from both the parties.

24.2 It shall depute an officer of the Nature Protection Squad to receive complaints from weaker sections regarding operations of VNHEC and PNHEC and give a written acknowledgement of receipt of the same. This provision would be publicised widely.

24.3 Within 10 days of such complaint the secretary of TNHEC shall seek an explanation from concerned VNHEC/TNHEC president and place it before TNHEC and notify the sub-committee for welfare of weaker sections and social welfare department at taluk and panchayat level in this regard.

DISTRICT NATURE, HEALTH AND EDUCATION COMMITTEE

25 Norms:

25.1 DNHEC norms are a set of rules which all DNHECs shall have to specifically design and strive towards their compliance within their territories. These norms should ensure that:

25.2 The lands and waters vested with VNHECs should not be privatised or put to any use benefiting private parties to the detriment of the general community by altering their status.

25.3 Existing conservation practices like sacred animals, trees, groves, ponds, etc., shall be protected, as also practical ecological knowledge of people would be recognised, respected and rewarded.

25.4 No forest produce shall be harvested except under the plan prepared/procedures laid down by VNHECs. Clear-felling of trees and sale of timber above a certain ceiling limit would need prior written permission of TNHEC.

25.5 It shall lay down procedures for VNHEC to reward individuals for *in situ* conservation efforts like growing of local cultivars and maintenance of other genetic resources of value.

25.6 It shall stipulate the total number of members of VNHEC in proportion to the population and its composition. It shall also specify the proportion of seats reserved for weaker sections in the VNHEC. It shall also specify the number and spatial coverage of special regional federations representing resource users like migrant graziers, artisanal fisherfolk and non-timber forest produce collectors

25.7 The migrant graziers shall have their traditional right of way across any of the VNHEC property. It shall be altered only after providing them with a satisfactory alternate passage.

26 Procedures and Formats to be Designed:

26.1 It shall in consultation with the technical cell set up as per section 28.1 and NGOs shall prepare formats for recording information on the following: (a) Details regarding property assigned to VNHEC and permanent records regarding such property; (b) Information on socio-economic and environmental parameters especially relating to natural resource use, health and education of people; (c) Community register which documents elements of biodiversity and associated knowledge systems.

26.2 It shall design procedures for rewarding persons involved in the initial bench-mark survey and also for regular monitoring, evaluation and internal auditing of VNHECs from component M

26.3 It shall set up the procedure for the election process of VNHEC members.

26.4 DNHEC shall also design procedures for internal auditing of PNHEC to be carried out by members of the other PNHECs.

26.5 DNHEC shall formulate the service rules for village health and education workers

27 Ensuring Compliance to the Norms:

27.1 It shall be the responsibility of PNHEC and TNHEC and especially Nature Protection Squad that norms prepared by DNHEC are implemented by VNHEC. Non-compliance of this section shall be reported to DNHEC and could result in prosecution of concerned VNHEC president/members and/or take over of VNHEC by TNHEC.

27.2 It should devise procedures by which TNHEC shall be empowered to take over VNHECs' collective property with persistent bad performance as per the Evaluation Committee reports and also terms for restoring it to VNHEC.

28 Establishment of Technical Cell:

28.1 The DNHEC shall set up a technical cell with adequate infrastructure. This shall work in close association with scientific research institutions, universities, colleges as well as the local population, especially people with high levels of practical ecological knowledge such as fisherfolk or traditional health practitioners.

28.2 The technical cell shall address the environmental and public health problems/issues faced by VNHECs or other bodies or individuals to generate locality-specific solutions taking cognisance of modern scientific knowledge as well as practical ecological experience of people.

28.3 It shall extend to VNHEC and PNHEC technical help for preparation of management plan. It shall disseminate relevant information for the people in the local language.

29 Working of DNHEC:

29.1 DNHEC shall function as a sub-committee of zillah parishad. It shall have autonomous powers in matters concerning natural resources, health and education unless it violates the laws of the land or verdict of zillah parishad sub-committee on protection of weaker sections.

29.2 It shall have power to make new rules and change any of the provisions regarding NHECs under its control as in Table 2. An appeal against such rules will be with the court of law, and not any state NHEC or NEC.

29.3 For this, it shall convene a meeting of NGO watchdog committee along with DNHEC and allow for sufficient debate, after giving one month notice about such meeting and circulating the information on new rules/amendments to all participants.

29.4 Any further changes in the policies to be recommended shall require a quorum of 80 per cent of members and 3/4 majority, the NGO watchdog committee representatives shall have voting rights at such meetings.

29.5 It shall give rewards to people, VNHECs and RFNs as per recommendations of the TNHEC

29.6 It shall also recruit the needed office staff for its own and TNHEC activities and such recruited officials shall be under total control of DNHEC.

29.7 The funds for maintenance of DNHEC, technical cell and TNHEC shall come from the DNHEC fund which is formed by contribution of a fixed percentage of components C and M and shall be clearly indicated in the processes of distribution of funds to VNHEC.

30 Participatory Environmental Impact Assessment:

30.1 There shall be a participatory environmental impact assessment of various

impacts on VNHECs like pollution, urban sewage and waste, mining and various development projects.

30.2 This shall be initiated by DNHEC either on its own, or on suggestions by concerned VNHECs, on request from the National Environment Commission, government agencies, or private enterprises.

30.3 The technical cell of the DNHEC shall carry out such an exercise with the help of affected VNHEC members. The state pollution control authorities and other such governmental agencies shall provide needed expertise, infrastructural support and training.

30.4 This process shall be carried out for existing problems as well as proposed projects which come under conditions of section 41.6. The finalised report shall be used to present the case of VNHEC as per section 41.7.

31 *Monitoring and Evaluation:*

31.1 It shall set up a standing committee for monitoring and evaluation at district level consisting of one member from each Taluk evaluation committee which shall submit status report of each TNHEC level functioning.

31.2 Such reports shall be compiled and analysed by the technical cell. The DNHEC shall receive compiled evaluation reports and internal auditing reports from TNHECs directly.

32 *Sources of Funds and Handling of Finances*

32.1 It shall annually receive from SNHEC funds towards component M upon submission of abstracts of evaluation reports of PNHECs, and from NNHEC funds towards component C on submission of evaluation report abstracts of VNHECs.

32.2 The funds shall be allotted based on performance as per section 32.1. The sum total of the performance of constituent VNHECs shall be considered as the performance of the DNHEC for both components.

32.3 In the event of false performance claims the president of the concerned agency like VNHEC/PNHEC/TNHEC or evaluation committee leader shall be held accountable under section 35.2.

32.4 It shall publish the evaluation reports and financial allocations.

33 *Prevention of Offences and Nature Protection Squad:*

33.1 It shall formulate a set of rules to define offences as in Table 2 which shall be binding on TNHEC, PNHEC and DNHEC itself. Such rules shall form the general basis of trial of offenders in the court of law and

Nyaya Panchayat and all NHEC bodies below the district level.

33.2 DNHEC shall request deputation for staff of Nature Protection Squad from the existing personnel of state forest department and other relevant departments like coast guard, police, excise, revenue, etc, depending on its requirements.

33.3 The control over such squad shall be shared between DNHEC and the concerned departments. Exact mechanisms of such sharing of control shall have to be worked out in each state with respect to payments, increments, promotions, transfer, etc.

33.4 The primary task of Nature Protection Squads is to assist VNHECs in prevention of environmental offences. Nature Protection Squads shall ensure that DNHEC norms are followed by VNHEC, PNHEC, RFN and TNHEC. In case of non-compliance they can report to DNHEC president and also to state level officer of Nature Protection Squad at SNHEC.

33.5 DNHEC must take notice of such written reports by Nature Protection Squad and take appropriate action within 21 days of receiving such reports and send a copy of action taken to state level officer of Nature Protection Squad.

34 *Conflict Resolution and Redressal of Grievances*

34.1 The DNHEC shall design procedures for establishment and operation of Forums of Redressal and Conflict Resolution at panchayat level called Nyaya Panchayats. These shall follow the model of the Karnataka Mandal Panchayat and Nyaya Panchayat Act 1983.

34.2 It shall be the final forum for resolution of conflict between any VNHEC and PNHECs. However in the case of TNHECs the final authority shall be SNHEC.

34.3 It shall set up a district level watchdog committee with representatives from each of the TNHEC level watchdog committees. It shall be mandatory for DNHEC to enquire into written complaints given by the same and carry out follow up action within one month of such complaints.

34.4 It shall also suggest changes in management plan of VNHEC in accordance with RFN as per recommendation of TNHEC after giving a fair hearing to concerned VNHEC.

STATE NATURE, HEALTH AND EDUCATION COMMITTEE

35 *Changes in Policy at State Level:*

35.1 The provisions of this bill need large-scale changes in the existing laws and policies of state. At the initiation of this process the SNHEC shall be responsible for drafting the required changes.

35.2 The new policies shall promote management of all natural resources on an integrated and decentralised basis. The environmental offences shall be defined with respect to natural resources and public health including pollution and deleterious effects of commercial exploitation and urban waste and sewage, and with respect to false claims of performance, for instance of conservation of biological diversity.

35.3 The process of preparation of drafts of new legislation shall involve DNHECs and NGO watchdog committee members.

35.4 Any further changes in the policies to be recommended shall require a quorum of 80 per cent of members and 3/4 majority. The NGO watchdog committee representatives shall have voting rights in such meetings.

35.5 In the task of formulating and drafting of the policies SNHEC shall be helped by the relevant departments and legal cell of the state government.

36 *Sharing Control over Relevant Government Departments:*

36.1 The powers and functioning of government departments concerning natural resources, health and education shall have to be reoriented as per the provisions under the NHEC system. The SNHEC shall design appropriate set of rules and procedures for this purpose along with NGOs and relevant departmental secretaries.

36.2 It shall share administrative control on Nature Protection Squad and education and health facilities provided on the basis of section 37.4.

37 *Working of SNHEC:*

37.1 It shall set up a standing committee of scientists belonging to R and D institutions and universities to take up research and evolve management strategies on specific problems as suggested by the technical cell of DNHEC and provide expertise for planning and development.

37.2 There shall be internal auditing of every DNHEC at least once in two years by other DNHEC members.

37.3 It shall reward the best performing DNHECs with respect to component M every year.

37.4 It shall ensure that state government shall provide the facilities for health care and education mentioned in Tables 3 and 4 as the minimum requirement. The number of such facilities to be provided and categories of diseases to be treated at each level shall be decided on a regional basis considering its remoteness and extent of current availability of such services.

37.5 The curriculum for formal education till pre-university level shall include interactive learning through monitoring the

status of local natural resources, public health environment, socio-economic milieu and ongoing development processes. There should be enough flexibility built in for the DNHECs to tailor the education to their locality-specific needs and culture of people. The non-formal and vocational education shall be designed and implemented at the TNHEC and PNHEC levels.

37.6 It shall deal with losses caused by pollution, urban waste and sewage and unfair trade practices by commercial interests causing loss to VNHECs. It shall be vested with enough penal powers by National Environment Commission for this purpose as per sections 41.5, 41.6 and policies of section 35.

37.7 The costs for maintenance of SNHEC shall be borne by the state government.

37.8 There shall be a State Nature, Health, Education Fund which shall receive contributions from the state government funds earmarked towards development of natural resources, health and education. The relevant procedures and norms of allocation by the state government should be worked out under sections 35 and 36. DNHEC and SSA shall receive their component M from this fund as per their evaluated performance.

38 Monitoring and Evaluation:

38.1 The SNHEC shall decide on the parameters for evaluation of natural resources, education and health care. It shall compile the results of monitoring these parameters from TNHEC and DNHEC reports which are to be published by it periodically.

38.2 It shall set up a body of scientists, NGOs and SNHEC members to assign values to parameters of health, education and natural resources which shall be periodically reviewed based on the findings of section 38.1.

38.3 The entire process in section 38.2 shall be transparent and the copies of the decisions sent to all VNHECs by the committee.

38.4 It shall set up a computer-based data bank with adequate safeguards for relevant intellectual property rights containing information on natural resources including biodiversity, health and education and community registers of VNHECs and link this to the NICNET operated by the National Informatics Centre.

38.5 Such data bank shall remain under the joint control of SNHEC vice president and presidents of NGO watchdog committee and evaluating committee mentioned in sections 39.2 and 38.2.

39 Conflict Resolution and Forums for Redressal:

39.1 It shall be the final forum for appeal regarding any disputes about TNHEC located

within the state.

39.2 It shall also set up a watchdog committee of NGOs at state level having representatives from each district which shall help SNHEC functioning.

NATIONAL NATURE, HEALTH AND EDUCATION COMMITTEE

40 Supporting the Policies of NHEC:

40.1 As in the case of SNHEC it shall draft new policies required for the central government under the NHEC system. It shall follow the procedures similar to those in sections 35 and 36. The focus shall be on concurrent subjects of state and centre and on safety sites.

41 National Environment Commission:

41.1 It shall be constituted from NNHEC representatives, scientists and NGOs with outstanding contributions in natural resources, health, and education. It shall have an independent status and shall be answerable only to the parliament.

41.2 It shall be vested with judicial powers for resolving disputes within areas of its mandate. It shall have the mandate on all external impacts on VNHEC like pollution, commercially exploitative forces, loss/displacement by development projects of government, pest and disease epidemics, etc.

41.3 Based on the monitoring committee reports from DNHEC, SSA and SNHEC it shall assign values to elements of biodiversity and identify parameters for evaluation of biodiversity which shall apply to the entire country.

41.4 It shall also collect information on status of communicable diseases, vector populations and pest and disease outbreaks of crops as well as livestock on a regular basis.

41.5 It shall receive petitions on pollution, adverse effects of urban areas, displacement of persons in developmental projects, etc. and initiate an enquiry at DNHEC or/and SNHEC levels.

41.6 Such cases shall be classified based on the magnitude of the problem and loss and assigned to appropriate levels. Decisions at lower forums shall be open to appeal in NEC and its verdict shall have an appeal only to the special bench of the Supreme Court.

41.7 In order to conduct an enquiry NEC shall appoint a panel of relevant scientific experts, lawyers, NGOs and NNHEC members at national, state and district levels. They shall hear the case of affected VNHECs or people and conduct direct investigations in the field. The findings of the panel and its judgment shall be published.

41.8 The panel shall receive financial assistance and honorarium from NEC and shall be held accountable for their findings.

41.9 The scope of the enquiry shall include existing instances of section 41.5. The proposed projects shall obtain a clearance certificate at the appropriate forums as per section 41.6.

42 Functioning of NNHEC:

42.1 There shall be a national environment fund and such a fund shall receive the following contributions: (a) From biodiversity cess to be levied by central government on all commodities which benefit from usage of elements of biodiversity; (b) Funds earmarked for conservation of biodiversity and towards management of protected areas by state and central governments; (c) Contributions from international forums, future payments received for royalties based on genetic resources and knowledge pertaining to it on which India has sovereign rights; (d) Fees charged to development projects, industries, etc. for organising participatory environmental impact assessment; (e) Cess on industries and urban areas causing pollution; (f) Funds earmarked for monitoring status of contagious diseases, pests and diseases of crops and livestock and vector populations.

42.2 Funds shall be allotted to individual DNHECs based on performance reports submitted by the district level monitoring committees.

42.3 It shall stake claims in all appropriate forums for intellectual property rights of the VNHECs as per recommendations of either DNHEC, SSA or SNHEC.

42.4 The country's interest in matters regarding natural resources shall be represented by NNHEC in all international forums.

42.5 It shall support working of Nature Protection Squads in DNHEC and also ensure that law enforcement agencies co-operate with it and extend infrastructural support.

42.6 It shall pay special attention and extend support to management of safety sites and ensure their smooth functioning.

42.7 The costs for maintenance of NNHEC shall be borne by the Government of India.

42.8 It shall co-ordinate the laws and plans for development between states so that environmental offenders shall not take advantage of such differences between DNHECs. This shall be done by giving appropriate directions to DNHECs and SNHECs.

42.9 It shall be the final authority to decide in disputes/conflicts at DNHEC and SNHEC levels.

42.10 It shall reward the best performing DNHECs regarding component C based on a system of internal auditing of section 37.2.

SAFETY SITE AUTHORITY

43 Management of Safety Sites.

43.1 The safety sites in contrast with supply sites shall be carved out of areas of dense forests and sparse population, well preserved freshwater and marine habitats, existing wildlife sanctuaries, national parks, biosphere reserves and other protected areas. The emphasis shall be on continuity of the patch and on *in situ* conservation of biodiversity elements.

43.2 The system of management shall be similar to that of supply sites with certain modifications. Suitable mechanisms shall be designed keeping in mind the interests of both people living in the interior of such patches and at the periphery as well as wildlife and other elements of biological diversity.

43.3 SSA shall be the equivalent of DNHEC. In case VNHECs being more than 25 it shall be formed from RFNs. In cases where less than 25 VNHECs are present it shall be directly formed from VNHECs.

44 Delimitation of Boundaries of SSA and VNHEC.

44.1 Initially the existing boundaries of protected areas shall be accepted.

44.2 The task of redefining the boundaries of sites from existing protected areas and other suitable areas from land, freshwater and sea within the state shall be carried out by SNHEC and across states by NNHEC. It shall, however, be under powers of NNHEC to change the boundaries.

44.3 Such jurisdiction of safety sites shall also include villages in the periphery, who use the forest patch or water body and/or are affected by wildlife of safety sites.

44.4 Such a process of delimitation of boundaries shall be participatory in nature involving people of the locality along with the NGOs active in the region.

44.5 The boundaries shall be decided based on the ground situation regarding status of vegetation and biological diversity of the proposed area and livelihood alternatives for the people dependent on it as assessed by experts from the technical cells of SNHEC and NNHEC. It shall strive to strike a balance between interests of biodiversity and people residing in and near safety sites.

45 Assigning Territories to VNHECs:

45.1 Within SSA, the units for formation of VNHEC shall be tribal settlements, hamlets

and revenue villages. The traditional leadership of tribals/non-tribals shall be consulted in this regard.

45.2 Territories to individual VNHECs shall be assigned based on the conventional traditional arrangements in practice amongst such communities. However, in demarcating such territories watershed approach and natural boundaries like stream, hillock or conventional boundaries in case of water bodies are to be followed to the extent possible. For this process traditional leadership amongst tribals and non-tribals, NGOs active in the area shall be consulted and involved.

45.3 After such a process, the property rights are given to VNHEC as in section 8.0 and in this case final authority shall be the Safety Site Authority (SSA).

46 Protection of Interests of Tribals and Biological Diversity:

46.1 As a norm of SSA, harvesting, sale and transport of timber shall be banned, along with capture, collection and hunting of endangered species.

46.2 As a norm of SSA, in documenting biodiversity knowledge systems, it should be ensured by SSA that people employed on such task shall not misutilise it for commercial gains and proper safeguards shall be given to information in community register.

46.3 Strategies shall be worked out by the technical cell to minimise human-wildlife conflicts. Victims of such attacks and loss of property shall be adequately compensated as per the procedures fixed by SSA.

46.4 Service charges for the protection of biological diversity paid to VNHECs shall be at a higher rate than the supply sites. The exact quantum shall be decided by National Environment Commission.

47 Working of SSA:

47.1 The provisions shall be similar to supply sites but the strength of Nature Protection Squad shall be increased and SSA shall be equivalent to DNHEC in powers. There will have to be more co-operation amongst VNHECs to prevent offences as the forest patches are continuous.

47.2 It shall maintain a full fledged technical cell of educational and research institutions to help devise suitable planning and development strategies for this region.

47.3 Such a set up shall interact closely with VNHECs and help them to implement various development strategies which are in tune with the culture and traditions of people.

47.4 With the help of its technical cell and expertise from SNHEC and NNHEC it shall evolve suitable strategies for management of wildlife, livestock and

fodder, trade and value addition to forest produce, cottage industries based on forest produce.

47.5 It shall encourage social forestry, agroforestry, alternatives to fuel wood like gohar gas, stall feeding, improved management of livestock in peripheral areas to avoid pressures on safety sites.

47.6 It shall ensure that the management of safety sites shall closely involve the people in the area. This can be done by working closely with interested NGOs, giving special importance to monitoring committee reports, ensuring that the VNHECs receive their rightful funds and creating awareness about provisions of this bill and establishing free flow of information regarding working of SSA.

Globalisation and 'New World Order'

What Future for the United Nations?

Rajni Kothari

Decline of the United Nations, along with that of the nation-state, is happening at a time when a new phase of world corporate capitalism is being ushered in. Yet, the oppressed peoples of the world need the broad umbrella of the UN which will restore the democratic and liberating role of the nation-state, return to the issue of equity between and within nations, and re-emphasise the North-South dimension of world order.

WILL the call of the turn of the century and the dawn of a new millennium be responded by humanity retrieving lost ground or even breaking wholly new ground, or will it take us further along a slowly engulfing nemesis pushing us towards a precipice? Not the precipice of a nuclear war but perhaps something more dreadful, namely, the dissolution of the human civilisational enterprise as such: not moving forward to but rather receding into the 21st century. I have in mind not some doomsday prediction caused by forces beyond our control but a nemesis brought about by our own actions and inactions that are leading to an erosion of institutions that we thought we had created to provide 'unity' and 'order'.

The idea of a UN had, beyond the negative conception of avoiding a third world war, posited a positive conception of unifying a vastly fragmented, conflict-ridden and highly dispersed humanity composed of 'nations' and 'nation-states' for which the 'great powers' were to provide a framework of co-operative relationships for the preservation of peace and a global spread of human well-being and justice. As this failed to materialise, there emerged the idea of a world order which was posited to promote structures and initiatives, policies and perspectives, that would promote both peace and justice and through such initiatives arrest the disintegrative and chaotic conditions that appeared to engulf the world of nation-states including the 'great powers' themselves – seeking to provide a modicum of 'order' to it all.

These were the broad conceptions in which a combination of visionary statesmen, scholars, thinkers and international civil servants had thought of responding to what already appeared like a fast enveloping crisis of survival for a world besieged by growing divisions between regions, classes and ideologies. Instead what we got, following the second world war, was a long period of cold war that far from 'containing' sources of conflict and confrontations, spanned them further over a period of 40 years – in different phases, involving practically all parts of the earth – subsequently followed by a 'post-cold war' period that has given rise to a large and widespread upsurge of

nationalist, ethnic and religious turbulence, of growing violence and volatility from the bottom upwards, which in turn is being used for establishing a new model of hegemony in which the UN itself is being made an instrument.

What prospects can we envisage for the twin principles of unity and order through a structure of institutions that is there and can be utilised and strengthened in the face of such a drastically changed global context in which the old 'balances', 'deterrences' and multilateral and pluralistic (east-west, north-south) engagements are no longer working? Several facets of this drastic change can be noted: (a) The building block of the pre-existing system (the 'order') – the nation-state – is undergoing deep erosions, shifts, crises over 'boundaries', pressures from both the micro and the macro spaces, throwing the whole system into jeopardy and subject to completely new manipulations and patterns of dominance;¹ (b) There is emerging a new style, culture and patterning of a new generation of nationalism in different parts of the world precisely when the old nation-states and transnational federations and confederations (sometimes called 'empires') are in disarray. The directions in which this new upsurge of nationalism will take us are wholly unclear. Uncontrolled violence and undeclared wars and civil wars seems to be the order of the day; (c) Meanwhile something else is also happening. Precisely in and through the shifts and erosions mentioned above, a new and different kind of upsurge of consciousness, based on a growing awareness of both change and the need for change, is in evidence, depicting a world in transition, this time not at the nation-state or the global level but at the grass roots. It is taking place in large parts of the world but is getting expressed in such a large variety of forms that again the directions are not clear and for which, as compared to the other two dimensions of change, we seem to be ideologically unprepared in respect of a relevant intellectual 'paradigm' and in respect of the goals and teleology of this transition; (d) Alongside such an upsurge and in part contributing to and in part responding to it have been the series of patient and gradual struggles for

a more just and humane world order and the creation of a truly 'global' UN. This included the whole north-south dialogue, the south-south notions of co-operation and solidarity (NIEO, etc) and the alternative ideological formations and political structures that had emerged as part of this patiently pursued struggle for change. The non-aligned movement, the G-77, the development decades of the UN, major institutional initiatives like UNCTAD in which the third world had an important say and the growing interface between peace research institutions and networks and the UN system.² Shorn of these inputs, the institutional framework of 'world order' has degenerated into the politics of the so-called 'new world order' which is increasingly taking on a hegemonic construction, reducing the UN into (in the words of Richard Falk) 'a scapegoat or political football, depending on the circumstances', undermining whatever autonomous role and functioning that it seemed for a while to acquire, say between 1987 and 1991, increasingly viewed as 'a rubber stamp or a deforming obstacle to the clear pursuit of strategic interests in the world'. In my own view, though, the real change underlying all this erosion is something more basic, namely, the growing disempowerment of states and governments in dealing with major concerns facing humanity, increasingly coming under pressure both from without and from within.³

This is happening at a time when we are being ushered into a new phase of world corporate capitalism, not just worldwide but truly global in its sweep, aggressive, undermining of political units and their autonomy everywhere and at all levels, having already earlier used them as part of its neocolonial phase. In the new phase there is a declining role of both individual and collective political entities, both the nation-state and the state system. The other major aspects of this phase is the declining concern with issues like poverty and social disparities, the economic agenda itself having undergone a drastic change, the political (nation-state) framework within which the economic agenda used to be carried out is being underplayed, the economic-technological focus is acquiring an autonomy of its own,

the cultural-cum-communications onslaught too is becoming largely economic in content (consumerism, etc) and, following this new version of economism, national elites too are being prompted to depoliticise their concerns. What we are getting is a radically changed nature of world capitalism⁴ in which the nation-state (including the dominant centres of national power) is being side-stepped and we are being moved into a new phase of world history—post-colonial, post-imperial, post-cold war, post-north-south divide, something new and pervasive. It envisions a new partnership between national elites, transnational capital, especially finance capital, a new international trade regime, state bureaucracies being overlaid by national and regional business and capital, including a large role for speculative capital (producing a series of 'seams'), all of this backed by the mass-media and a newly fashioned mass culture.

It is a partnership of which the basic thrust is both the depoliticisation and the delegitimisation of the state while, at the same time, by increasing the importance of a new set of institutions, mainly the three Bretton Woods institutions, increasing their legitimacy. Strange though it may sound, the tribes that are being paid to these institutions for both 'stabilising' and 'structurally reforming' the global economy are happening precisely at a time when their mission seems to be to undermine the very institutions through which the post-war enterprise of development had been undertaken. The point of it all is the increasingly felt need in the new international think tanks to reduce the role of the state in the affairs of various societies and to transplant it by a renewed centrality of the market mechanism and to increasing integration of diverse economies into the 'world market'.

This may be a good point at which to lay out the original vision and perspective that informed the rise and legitimacy of the modern state, and its subsequent decline in both its wide acceptance and its legitimacy.

MODERN STATE IN PERSPECTIVE⁵

The state in modern times has been a source of both law and legitimacy, of authority and monopoly over coercive power (or so it was presumed and in that presumption lay its power), a source also of security for the people, of systems of justice, equity and accountability, and through them all, of conditions of freedom and creativity, the arts and the pursuit of excellence. It has been the premier institution through which the multiplicity and plurality of the civil domain has been ordered in both perception and reality.

The modern state began as both a philosophical idea and a political construct

to deal with a widespread condition of chaos and uncertainty and to provide conditions of peace, order and security in their place. So germane was it to the human enterprise at that stage (towards the end of the middle ages) that it soon got institutionalised by becoming an international actor for the promotion of the same ideas of peace and security, now on a world scale, even though the 'world' was still a limited geographical concept confined as it was to the early Englishmen and Europeans. However, the process got further consolidated with the adoption of the nation-state format by a large array of newly emergent countries after the second world war. The nation-state on the one hand, and the state system on the other, provided the fulcrum around which the world got organised. Even the superimposition of the two superpowers and the emergence of power blocs – or of the UN for that matter – did not reduce the importance of the state as the basic unit of organisation and identity in our world. Insisting on the identity it creates being prior to all other identities, the state has either reduced all other corporate identities to individualised subjects or, to the extent it admitted the existence of the former in the form of a complex called civil society, it has purported to be both the embodiment and the protector of such civil society – including the embodiment of cultures, at once their plurality and their mono-cultural form called the nation or territory or region.

It is out of this search for centrality and legitimacy in the modern world despite so much diversity all around that a series of theoretical models defining the relationship between the state and the individual or the state and the citizen emerged and have been with us. These models also reflect shifting perspectives on the state following the quickening of the historical process in Europe and beyond – the two world wars, the great depression following the collapse of the business cycle, the revolt of the masses ever since the French revolution and leading up to the communist revolution as well as the social democratic alternatives to it, the rise of fascism on the one hand and Soviet-style totalitarianism on the other, the end of old-style imperialism and the redefinition of the economic problematique in our time, giving rise to new questionings, alternative models and hypotheses. We have had the bourgeois democratic liberal institutional model of the state based on the theory of accountability. Different from it but at times complementing it has been the social democratic model of the state assuming responsibility for social transformation and the welfare of the people. We have had the Marxist model which has considered the bourgeois state as a committee of the dominant classes but one that also supervises relations of production that by their very logic create contradictions that lead to a protracted class struggle ending in

a revolutionary takeover by a vanguard party representing the proletariat. The transformation launched under the communist party was meant to, by stages, usher in socialism and the ultimate withering away of the bourgeois state as we have known it.

In recent decades, with the growing sensitisation on the human dimensions of the state and its policies and realisation of its increasingly repressive and exploitative thrust (in both bourgeois and communist countries), there has emerged a somewhat different conception of radicalism in the form of a liberal-cum-neo Marxist model of the state as a space in which the struggle for civil and democratic rights is being waged with a view to usher in a decentralised, 'sustainable' and people-centred structure of institutions that would promote social transformation. This is the broad conception that what are known as the new social movements, together engaged in an attempt to create an alternative model of both development and democracy, have in mind.⁶ There is also a Gandhian model of the state as a trustee and an arbiter between conflicting arenas of interest from the perspective of serving the deprived strata of a society, the poor and the socially ostracised, through modes of decentralisation and people's empowerment. My own idea (not yet a model) of the state is that of a plural arena which while it displays growing use and misuse of the coercive apparatus and sinews of repression and terror, still also continues to be a mediator among contending groups claiming 'rights' of diverse citizen groups and 'privileges' of less diverse yet differentiated structure of entrenched interests and classes and bureaucracies. I think of it as an increasingly problematic yet still relevant arena encompassing the large diversity of both contending and coalescing populations and interests within a context of historic transformation based on the democratic aspirations of millions and millions of people round the world.

Each one of these models of the role and significance of the state is in a state of transition, facing as it does new forces that arc on the horizon (to which we shall presently come). While on the one hand there is still a wide degree of faith in the state, especially among common people, particularly the dalits, the general mass of the poor and the oppressed, the minorities and the women,⁷ producing a kind of mystification of the state, on the other hand it is faced by growing scepticism and doubt about its efficacy, producing a demystification and decline in both the aura and majesty that it once enjoyed. Instead of centrality and a dominant status of the state, we face a combination of growing marginalisation in its role and status in civil society and growing myopia, dehumanisation and brutalisation in its relationship with the

same civil society. Interestingly, the marginalisation of the state that seems to be proceeding apace is a result of both over-extension and shrinkage. The international order itself which was based for long on the state system (even the capitalist development model had accepted the state as a key instrumentality) faces an era of uncertainty following the Reaganite-Thatcherite reaction to the right, some of which may be wearing off but the basic mind-set continues and conditions the entire functioning of the world system. Both, the so-called 'new world order' and the new Pax Americana, sound ominous for a stable and predictable world order. But no less serious is the new backlash at the civil society end, at the 'grass roots' representing new stirrings of consciousness and new assertions of power based on the one hand on class and ethnicity and on the other nationality and religious identity. With this the state as an institution is under severe strain. In consequence, it faces a variety of bids of both taking it over and undermining it in the names of the economy, world security, religion, ethnicity and notions of self-determination, of 'nations' and regions. These have particularly grown following both the collapse of the Soviet model of state hegemony in ordering social and economic relationships and the decline of the post-colonial movements of nation-building seeking both autonomy and legitimacy of the state in large parts of the third world.

COLLAPSE OF SOVIET UNION: IMPLICATIONS FOR FUTURE OF THE STATE

In a way the collapse of the Soviet Union provides us with a historical vantage point from which to appreciate the growing erosion and marginalisation of the state, in particular through its very over-extension. Paradoxical as it may appear, while the Soviet Union was the ultimate in the wielding of state power it also produced, over time, its erosion and delegitimation, a growing admission of incapacity of the instrumentalities of state and party and loss of faith in them among both the rulers and the ruled. While we are still too close to events in the former Soviet Union the full significance of which is still unravelling, there is little doubt that what we witnessed at the end of the 1980s was in many ways unique in modern history and cannot be explained except by reference to the hollowness of the whole corpus of the state in it. The phenomenon of Gorbachev and what happened under him⁸ has been pushed in the background following the coup against him and the rise of Yeltsin and his wholly adventurist politics, hoping to refurbish the Soviet state, in which he is not likely to succeed, despite the sustained backing of the US.

The Gorbachev phenomenon seen as an attempt to dismantle an over-grown state

presents a fascinating case history of marginalisation through over-extension. Never before has a leadership in control of so much power and such an array of instrumentalities to wield that power (the army, the scientific estate, the immense nuclear power, the position of a superpower) itself dismantled the whole apparatus, allowed its vassals to go their own ways, completely turned around its ideological moorings, admitted that the entire edifice was unsuited to the needs of the people, and proceeded to disperse the whole framework of power and authority and the sinews of the state. Never before had so much change been brought about almost wholly non-violently and that too in a society that had never accepted the creed of non-violence, so sharply reduced its military might and its machinery of surveillance and intelligence and security and that in a state whose major source of strength lay in its armed forces and its worldwide security and intelligence apparatus, so drastically clipped the power of an all-pervasive party in whose structure of centralised control and institutional power the state had relied so much for more than 70 years.⁹ What the long offensive of American imperial power and its worldwide network had failed to achieve over 45 years was achieved by the play of ideas and force of conviction of a few individuals occupying strategic positions. (At a time when doctrines of 'end of ideology' and 'end of history' have been afloat, there has taken place such major changes in the global structure of power basically through the power of ideas.) And this quite clearly without any powerful and widespread movement from below.

The 'movement' that did take place was led by a unique set of intellectuals – Solzhenitsyn and his *Gulag*, Sakharov and his massive dissent, the sufferings and voices of a whole lot of other dissenters of the Soviet state. What has happened is nothing short of an elite giving up its enormous power for ushering their country along political and social change.¹⁰ The future of the former Soviet Union remains highly problematic but its disbandment has produced waves that will continue to have an impact on the state system as we have known it since the second world war as well as on the centralised nation-state as it has operated over large areas of the modern world for a still longer period. We have by no means arrived at a stage where we are willing to write off the modern state.¹¹ But that it faces increasing challenge, above all from the very dialectic it has let loose upon itself through the playing out, or over-playing, its own (internal) inherent logic, is without doubt. The challenge is by no means limited to this dialectic. It could have been contained and dealt with if it was just that. This will not be easy because of the accentuation of the crisis by the rise of new

and powerful forces that have emerged external to the main arena of the state but deeply affecting its status and survival as an institution, its role and position in human affairs.

NEW CHALLENGES AFFECTING SURVIVAL OF THE STATE

The modern state and particularly the nation state as a centralised structure faces serious challenges from at least three major sources. First, over the last few decades, technology seems to be replacing politics and socio-economic factors in the functioning of modern society, and this is seriously affecting the role of the state in civil society. It is leading to a process of depoliticisation, displacement of the civil servant who was accountable to elected bodies and the people at large by the technocrat who is accountable only to his peers and to the momentum generated by the rise of the micro chip and the computer and by impersonal forces that were always there but were somehow held in check by ideological and political factors in a system that was competitive, pluralistic and open to debate and controversy. It is not as if technology – and the rise of the machine in the affairs of man – was not there or was not there in an important way in earlier periods of history. The industrial revolution and its spread round the world was in no measure without a major technological concomitant. But it was still technology as an instrument of man and of nations including those (one imperial power after another) that had taken upon themselves the task of organising the whole world after their own image.

The significant change that has now come about is that this organising of the whole world is being taken up not so much by some imperial power or powers but by technology and its own inner logic and dynamics which are under no man's or nation's control. Indeed, not even the scientists and the technologists as individuals or associations know what the next step in the technological enterprise is likely to be. What we have is the dawn of an age of technological fixes without any identifiable fixer. Technology, whether in the field of military R and D (the leading sector in setting the global agenda for some time now),¹² informatics, medicine or agriculture (not to speak of genetics, eugenics and cloning) is taking on an autonomy of its own and subjecting the whole of mankind and civilisation into a captive status. It is homogenising diverse cultures and social sectors and marginalising the political process. Naturally, in a technologically determined world where there is little scope for real choices of a socio-political kind, the state loses its importance and governance itself undergoes a radical transformation. The fast changing

nature of world capitalism discussed above to no small extent draws upon this primacy of modern technology (itself undergoing major transmutations) and has in consequence provided a system of global management to which 'there is no alternative' (the TINA hypothesis). This has further deeply affected the nature of governance in our time. (The recent debate in conservative circles about governments losing control over the governed reflects a condition in which the term governance itself has changed in its meaning.) If there is a widespread sense of insecurity round the world, including among those who are supposed to be in charge, it is primarily due to this condition created by modern technology and its institutional catalysts (the MNCs) towards which civil society, lay citizens and the state as well is being pushed.

However, precisely at a time when the state is being rendered weak and disembodied before the advance of technology it is facing another major challenge from a source which is the polar opposite of technology and its homogenising mission. It is the assertion of cultures, ethnicity, nationalities, pluralism with a vengeance, when entire societies are bursting at the seams, when many regions of the world, when while the tension and violence generated by the cult of consumerism is spreading and destabilising social arrangements, the resulting state of anomie is precipitating the violence of terrorism and fundamentalism, and the modern state, as we have known it, is ceasing to be able to contain either or mediate between the two. With this, it is also ceasing to be an embodiment of civil society and a protector of the poor, the weak and the oppressed. The critique of the state as an arena of repression and terror is wholly valid as an empirical description of the relationship between the state and the citizen but it must take cognisance of the fact that it is also a state that has become powerless before the onslaught of the deep dialectic of technology and culture in our time. The state is ceasing to be a state. It is becoming something else which we as spectators facing the end of one millennium and the dawn of another must try to fathom but have so far been unable to.

This brings us to the third major source of challenge to the modern state, namely, the emergence of a new ideology, or rather a mind-set that is being proposed as a way out of all our problems and crises, including the crisis of the state, of the economy and of civil society. It is a mind-set that far from rejecting the role of modern technology, is proposing to make it the new 'god' of man — away from the old ideologies of liberty, equality and fraternity, away from the role of the state in promoting these values, proposing to marginalise both god and the state, making human greed and avarice the

prime movers of men and societies, and yet is coming forward and offering to mankind a new utopia — of globalisation. It is a utopia that holds out the promise of a new integration of the human enterprise, of joining diverse cultures and civilisations into one single marketplace, nudging along governments and elites and indeed the masses as well to catch up with this new fantasy. It is not integration based on diversity and of diverse entities finding a common ground but rather one based on cut-throat competition and rivalry, using whichever means that work, giving a new lease of life to the old idea of survival of the fittest which had been so far contained by the rise of alternative visions and ideologies but which, with the recent almost universal acceptance of the 'new world order', 'new society' and 'new democracy', seems to offer a way out to all but the poor and the already dispossessed who are in any case considered to be a surplus that can be dispensed with.¹³

As was mentioned in the beginning, the modern state emerged as a philosophical idea to deal with the situation of growing chaos and uncertainty, promising both order and justice. It seems that while the state as an institutional artefact may yet survive, the idea of the state that was so conceived may well be ending as a project of the modern age, exposing the world once again to chaos and uncertainty and without either order or justice.

UNITED NATIONS AND GLOBALISATION

The new framework of 'integration' that is currently being proposed poses a threat not only to the integrity of nations and cultures and seeks to displace the state as a source of both power and legitimacy. It also poses a threat to the state system as it evolved over the centuries and seeks to displace the UN as a basis for providing both unity and order. It proposes a major and historic diversion of the whole model of a political organisation of human affairs. Not only are states and the great diversity of communities and cultures that they represent losing their autonomy as global actors. The UN too is losing its autonomy and its role in world affairs, both in the area of maintenance of peace and security in the world and in the broader areas of development, culture, human rights and the defence of basic values. Again, the UN as an institutional artefact may well survive and may even be put to new uses by some powers but the idea of the UN as was conceived by a set of visionaries following the great crisis of human civilisation that led to the second world war seems like coming to an end. No amount of either technical or political restructuring (in terms of membership of the Security Council) that is currently being debated¹⁴ can change this

except through a new politics of transformation that starts from the very roots of the global social order and moves upwards to the institutions of the state, inter-state relations and the UN — in short, a restructuring of the world order in which 'world order' is conceived in a holistic, multi-level, multi-dimensional manner, in which all nations and cultures and states are enabled to participate.

As with the nation-state, the UN too stands on a paradoxical threshold. Its real power is on the decline and its credibility in a state of utter ambivalence even though it may appear to be over-extending itself and its writ. The dominant powers use it but really do not need it; it has itself been shedding its real responsibilities and institutional devices needed to fulfil them (as is the case with the nation-state), certainly in the socio-economic and cultural arenas but also in the arena of peace and security. And yet the peoples of the world, especially the poor, the disenfranchised, the displaced, the victims of state oppression and repression, the millions that have been rendered stateless and marginalised by their diverse cultures and communities, need it. They need the various institutions under the broad UN umbrella concerned with issues of survival, welfare, cultural integrity, rehabilitation with dignity and collective identity, as well as preservation and enhancement of living conditions of the working classes, the women and the children, the migrants and 'refugees', all those eking out a living in the so-called informal sectors of diverse societies. The growing role of the voluntary organisations, the NGOs and the grass roots activists in these spheres, both nationally and internationally, is testimony to the need for the framework of a world organisation as has been provided over the decades by the UN. Nor is the issue limited to socio-economic and cultural dimensions. The peoples of the world face an increasingly ominous spectre of insecurity in all its varied dimensions. They are in dire need of a system that provides 'people's security', peace and 'order', of law enforcement according to universal principles of the rule of law, justice and humane jurisprudence. Again it is the poor and disinherited of the earth that need such a system the most. They will need it all the more in the years and decades to come with the national institutions increasingly unable to provide conditions of survival.

That brings me to the issue of centralisation and decentralisation in the structuring of a world order with which I have for long been concerned and have given vent to in forums like the World Order Models Project and the United Nations University as against the world federalists and the one worlders.¹⁵ What I find is that the poor and the oppressed and the 'stateless' simultaneously need a global framework that is democratic and

representative and a decentralised 'political' structure within and across nation-states, both together responding to the demands of civil society, ethnic identity, constitution of the state, political-cultural movements, together providing a 'world order' that emanates from the very stirrings of civil society and the peoples of the world. Together, such a combination of governing structures must deal with the long shadow of depoliticisation that seems to be casting its spell over the last 20 years. This includes restoring the democratic and liberating role of the nation-state, returning to the issue of equity between and within nations, and re-emphasising the north-south dimension of world order, while at the same time gently but decisively intervening in the affairs of states that are found to defy norms of humane governance, decency and democracy often in the name of upholding national autonomy and security. An increasingly unequal world inhabited by brutal and dictatorial regimes necessarily plays down the political process, over-emphasises the economic and technological dimensions and gives greater and greater importance to trade-finance and balancing of budgets than to issues of poverty and justice. The decline of the socialist regimes and the erosion of the sense of autonomy of third world governments and the consequent decline of interest in ideological concerns have all contributed to this.

What a new UN that must emerge out of the diverse struggles for a humane order will need to take up is not just an effort to put down aggression, violence and war, none of which can be ignored, but also both a programme and a structure through which 'peace' becomes a condition of 'justice'. It must be an 'order' that controls the tendency to centralise and become coercive, moves away from a conception of governance that is mere 'administration of things' and ushers in a government of the people by the people and, only that way, for the people. In fulfilling such a mandate it will need to play roles that were not originally conceived for it, including at times asserting its authority in dealing with tragic human situations as it is already being called upon to - in Somalia, Bosnia, Rwanda, and may need to in Nigeria, Liberia and Sierra Leone where the state has practically collapsed under ruthless and self-aggrandising regimes. This will call for a new conception of the UN. While the threat of a world war or a nuclear holocaust may have receded, in some ways far greater challenges to the survival of humanity have come to the fore.

For all this the idea of an ordered universe (usually order from above) that is deeply ingrained in the 'scientific' paradigm of the modern west and its particular brand of universalism needs to be rethought, not necessarily to move towards a 'state of nature'

but towards a balanced harmony between diverse and often contending universes. Only thus can a world order be created that is truly humane, just, truly peaceful and emancipatory of the human condition.

Notes

- 1 In my 'Under Globalisation, Will The Nation-State Hold?', *Economic and Political Weekly*, July 1, 1995, I have dwelt at length on this theme.
- 2 A number of individuals engaged in grass roots movements had at one time been involved in the efforts to restructure the international system from the point of view of representing the interests of third world nations, some of them continued to work on an interface of the two. Over time, though, in light of the growing realisation that while leaders and diplomats of the third world waxed eloquent in global forums their own record at home was far from being progressive, many of these individuals began giving greater attention to citizen initiatives than to the UN and related structures. They also began to realise the growing power of transnational corporations many of whom took advantage of third world elites' desire to catch up with the developed nations technologically and in respect of trade and finance. Slowly there emerged the concept of a third system, representing citizen initiatives and voluntary bodies, as distinct from both states (and inter-state bodies) and markets and transnational corporations. The idea was first mooted in a systematic way by Marc Nerfin and his colleagues (many of them third world intellectuals) in the International Foundation for Development Alternatives (IFDA), disseminated in a sustained way through the *IFDA Dossier*. The present author underwent the same transition from focusing on changing the nature of governance within and across his own and other third world nations (as was laid out in his *Footsteps into the Future*, Orient Longman, New Delhi and Free Press, New York, 1974) to focusing on grass roots activism through the conception of a 'non-party political process'. See in particular his *State Against Democracy: In Search of Humane Governance*, Ajanta, Delhi, 1988.
- 3 For an analysis of this dual attack, see my 'Globalisation and The Revival of Tradition: Dual Attack on the Model of Nation-Building', *Economic and Political Weekly*, March 25, 1995.
- 4 I have dwelt at length on this phenomenon of a post-imperial model of world capitalism in 'Uncertain Future: The Paradoxes of Globalisation', forthcoming.
- 5 In this section I try to step back from the contemporary scenario with respect to the nation-state as depicted in 'Under Globalisation, will the Nation-State Hold?', op cit, and provide a historical-cum-theoretical overview for comprehending that scenario.
- 6 See the various issues and special numbers of the bi-monthly *Lokayan Bulletin* for documentation of the 'new social movements'. For a detailed critique of the Lokayan perspective and a major effort at providing a theoretical rationale of these movements, with emphasis in particular on peasant movements, see Gail Omvedt's ambitious *Reinvesting Revolution: New Social Movements and the Socialist Tradition in India*, M E Sharpe, New York, 1993.
- 7 I made an attempt to lay this out and to suggest that it leads to quite a different model of radicalism than found in the new social movements in my 'Rise of the Dalits and the Renewed Debate on Caste', *Economic and Political Weekly*, June 25, 1994.
- 8 For an early, and critical, appraisal of the Gorbachev phenomenon, see my 'The New Detente: Some Reflections from the South', *Alternatives*, 14 (3), July 1989.
- 9 See my 'Soviet Developments in Wider Perspective', *Mainstream*, Annual Number, 1991.
- 10 For a highly perceptive analysis of Gorbachev's contributions in taking his country along a path that almost completely departed from the Soviet Union's established ideological as well as strategic positions without at the same time renouncing its socialist commitments, see Bhupinder Brar's important study, *Explaining Communist Crises*, Ajanta, Delhi, 1994, especially chapter 7 on 'Perestroika, Powercentrism and the Hegemonic Universe'.
- 11 Indeed, there are signs of renewed legitimacy of the state in many parts of the world following the adverse results of privatisation in the third world, the return to power of former communist parties in some eastern European countries and the decline in romanticism about regional zones based on free trade and economic prosperity resulting from it (including in Europe itself), though there continues to be scepticism about the state enjoying a monopoly of power and there seems to have been a steady growth in globalisation of trade, technology and finance capital as well as in the consumerist drives of the post-modern world. I have discussed the revival of interest in and legitimacy of the state in the already cited 'Under Globalisation, Will the Nation-State Hold?', op cit as well as in an earlier piece entitled 'State and Statelessness in Our Time', *Economic and Political Weekly*, Annual Number, 26 (11-12), March 1991.
- 12 I have discussed the idea of the military being a lead sector in global affairs largely as a result of even new technological breakthroughs in 'Peace as a Technology Fix', paper presented at conference on Conflict Resolution at Dunedin, New Zealand, 1987, published in my *Transformation and Survival: In Search of Humane World Order*, Ajanta, Delhi, 1988.
- 13 On the dispensability thesis see my 'Of Humane Governance', *Alternatives*, 12, 1987, also published in *State Against Democracy*, op cit.
- 14 For a comprehensive treatment of the crisis of the UN and proposals to save it from further erosion, see the Dag Hammarskjöld Foundation sponsored report by Erskine Childers and Brian Urquhart, *Renewing the United Nations System*, Uppsala, Sweden, 1994.
- 15 My differences from those holding a centralist and supra-national perspective on world order were first stated in 'Towards A Just World', *Alternatives*, 4(1), June 1979, a revised version of which was published in *Transformation and Survival*, op cit.

Alternative Approaches to Devolution

Implications of Tenth Finance Commission's Scheme

B P R Vithal

In contrast to its imaginative and dynamic interaction with the states in the field of tax reform, the centre seems to be diffident and pessimistic in the area of inter-governmental fiscal transfers. Against this background, the recommendations of the Tenth Finance Commission in its Alternative Scheme of devolution are appropriate and timely. The basic feature of the scheme, viz, the pooling of the receipts of all central taxes for the purpose of determining the share of the states, is likely to be generally acceptable. What is needed now is a suitable mechanism for formally eliciting different views on the scheme and examining these with a view to evolving a consensus.

THE Tenth Finance Commission (TFC) has, in its report, suggested an Alternative Scheme for devolution (hereinafter referred to as the TFC scheme). The basis of this scheme has been stated by it as follows.

Our basic approach to vertical resource sharing has been influenced by the view that it would be in the interest of better centre-state relations if all central taxes are pooled and a proportion devolved to the states. There is considerable merit in moving to such a system as it would make the vertical sharing simple and transparent. It also gives greater freedom to the centre in choosing tax policy measures in an integrated manner. If a proportion of all taxes goes to the states, any apprehensions of bias in the choice of tax measures will be allayed.¹

The broad features of the TFC's scheme are:

- (1) pooling of the gross receipts of all central taxes and assigning a proportion thereof to the states;
- (2) all taxes in Article 269, except Central Sales Tax, shall form part of the central pool referred to above;
- (3) the centre shall continue to have the power to levy surcharges for the purposes of the union which would be excluded from the sharing arrangements with the states;
- (4) the share of the states in the total gross receipts of the centre shall be suitably provided for in the Constitution and reviewed once in 15 years;
- (5) initially this share shall be 26 per cent;
- (6) the existing tax rental arrangements shall be terminated and additional excise duties merged with basic excise duties, and
- (7) a further share of 3 per cent of the gross central tax receipts shall be assigned to the states in lieu of the additional excise duties.

The basic feature of this scheme is the pooling of all central taxes for the purpose of determining the share of the states. The Sarkaria Commission had earlier considered a similar suggestion but had not favoured it on the ground that "the scheme of the Constitution earmarking certain taxes for the exclusive use of the union is sound in

view of the very onerous responsibilities cast on it. We are of the view that while there is no particular advantage in bringing all tax receipts into the divisible pool, it may, on the other hand, place the union at a disadvantage."²

At the inaugural meeting of the inter-state council in October 1990 the then chief minister of Tamil Nadu had suggested that the council should be consulted, among other matters, on proposed legislation relating to taxation by the union which affects one or more states and its views and recommendations placed before parliament while introducing the legislation. If the pooling of central taxes for determining the proportion to be devolved to the states is taken to be an expansion of the divisible pool, then following this line of argument, the states may claim that they have an interest in all the central taxes and that, therefore, they need to be consulted in regard to all tax policies of the union government. Such a situation would make it impossible for any federal government to function. If, therefore, we are to go over to an alternative system of ensuring for the states a certain proportion of the total tax proceeds of the union, we would have to make a complete break with the present constitutional arrangement. There should then only be union taxes and state taxes and no longer any taxes which are divisible between the union and the states. The TFC took note of this problem by stating that while amending the Constitution "the power of the union to levy and collect all taxes in the union list should not be qualified by the proposal to transfer a certain percentage of specified central taxes to the states. In other words, while all List-I taxes remain union taxes and the proceeds of no particular tax shall be deemed 'divisible', the states will be entitled to a prescribed percentage of the tax receipts of the union."³ This should safeguard the new arrangement against the kind of disadvantage envisaged by the Sarkaria Commission.

The suggestion that a certain proportion of the total tax revenues of the union should be distributed among the states has also been made by the Chellaiah Committee on Tax

Reforms (1991). In subsequent reactions, the TFC scheme has generally been welcomed. However, I S Gulati,⁴ while stating that the "TFC is on strong ground in recommending a move away from the existing system of the states sharing revenues from only a few specified central taxes", has suggested the transfer of the entire sphere of domestic trade taxes to the states as an alternative. He himself anticipates "one possible objection" and admits "that the need for redistribution among the states, given the disparities in the levels of development, cannot be denied". His solution to this problem is one that "will involve some inter-state transfers and the relatively better-off states... may have to part with a portion of the tax revenues they collect in favour of other states less advantageously placed". It is difficult to see how such a mechanism can be devised in practice. The present system works because the authority that handles the divisible taxes, viz. the union government also constitutes the Finance Commission and considers its recommendations. Therefore, once this authority accepts a recommendation, it can also implement it. In inter-state transfers the union government will no longer be in this position and will have to get the consent of all the states for implementing the recommendations of the Finance Commissions.

This issue has been examined in a study by the National Institute of Public Finance and Policy.⁵ One of the suggestions to get over this difficulty considered in this study is that "40 per cent of the indirect tax revenues of each state would have to be transferred to the centre to maintain the pre-reform distribution of revenues among states. Ruling out transfer of such magnitude to the centre as impracticable, the authors next suggest a tax to be levied on the states at the rate of 2.5 per cent of their GDP." Considering that the share of the states in the tax proceeds of the union are now in the range of 2.7 to 2.9 per cent of GDP it would be a meaningless charade to let this accrue to the states first and then tax it away to the centre for redistribution again.

Implicit in these arguments is a recognition of the fact that origin should not be the sole basis of accrual; the needs of states based on their levels of development have also to be taken into account. The above study also comments that "the centre would be ill-advised to vacate the domestic trade tax field unless the states come forward to accept the logic of destination-based consumption tax". In the case of income tax it has taken 50 years to give up any share based on collection, even when this is a union tax. One can imagine what the resistance will be to giving up origin-based taxation when the tax becomes a state tax. We must also take into account the fact that a number of barriers will come up within the national economy, unless there is a considerable degree of inter-state harmonisation through central intervention. If such harmonisation is effected, the essence of the right to tax, viz, the determination of the rate, would have been surrendered. What would have been achieved then, except that the state now administers the tax and retains the proceeds as envisaged in Article 268? But if such retention also cannot be allowed, as explained above, then what would be the net advantage of such a change?

We have seen how difficult it is for the centre to ensure equitable distribution between two neighbouring states of a physical commodity such as water or even to enforce a court decision in this regard. We can imagine how much more difficult this will be in the case of tax proceeds already collected and retained by a state. Unlike water, money does not flow automatically to the lower level. The centre now performs the role of a dam which impounds it and can then redirect it. There may be disadvantages in this as in the case of large reservoirs. There is loss by evaporation and some patronage at the head-works. But it can, in the ultimate analysis, be made to work. In the alternative suggested by Gulati resources will just not flow from the more developed state to the less developed one. A common interest can be created for these two only when they are together in opposition to the centre.

Guhan,⁶ while recognising that "the Alternative Scheme" of the TFC "has made a significant contribution in indicating the direction in which the centre-state fiscal transfers can be restructured", suggests an alternative of his own (referred to hereafter as the Alternative Scheme). The main features of this scheme are that

- (1) It shall be provided through a constitutional amendment that (a) *not less than 40 per cent* of the centre's aggregate gross tax revenues will be shared with the states (emphasis in original); and (b) this ratio will be reviewed once in five years.
- (2) There will be no separate plan grants for state plans.

(3) Horizontal share criteria will be reviewed once in five years.

(4) Normal plan assistance to states will be confined to loans and to the capital account.

The intention of (1) above is not clear. The Constitution as it now stands prescribes a certain procedure for determining, once in five years, the share of the states in the proceeds of the taxes that are now shareable with the states. This can be modified if it is so desired. But once the share of the states is to be reviewed every five years there is no reason why such share should be specified in the Constitution. Further, if there are to be no further plan or gap-filling grants then why should the constitutional provision state "not less than" instead of just specifying whatever is the desired percentage. After all, in any case, it is to be reviewed after five years.

Guhan considers the suggestion of the TFC that it should be reviewed once in 15 years as a 'flaw' in that scheme. On the other hand, this is the crux of the TFC scheme. The basic idea is that the vertical sharing of resources between the centre and the states should not be a subject matter of discussion or controversy every five years. The TFC's scheme assumes that it is possible to determine the vertical share for a longer period, such as 15 years, while it may still be necessary to review the *inter se* position of the different states every five years. The union ministry of finance had, in fact, suggested that the vertical share should be fixed for 20 years. Much of the merit of this scheme will be lost if the vertical share continues to be a subject matter of review every five years. One of the criticisms of the Finance Commissions has been that, in adopting a gap-filling approach, they have knocked the bottomline out of the financial management of states. All that a state needs to do is to keep the huck passing till the next Finance Commission. This shortcoming in the present arrangement can be remedied to some extent by having a longer period of review for the vertical sharing.

There is a broad consensus now that the distinction of plan and non-plan expenditure within the revenue account has ceased to have meaning and that the revenue account should be looked upon as one integrated whole. Successive Finance Commissions have taken the view that the Constitution does not preclude them from considering the total revenue account, including both plan and non-plan, even if their terms of reference specify only non-plan expenditure. The TFC has also taken "the view that there is a clear rationale for the Finance Commission to deal with the revenue account as a whole" but it did not do so because of "practical difficulties". Therefore, in its own scheme it did not

follow this rationale and has recommended a percentage of transfer based only on non-plan statutory transfers in the past. On the other hand, Guhan, who takes the view that "there is, in fact, a 'clear rationale' for the Finance Commission *not* dealing with the plan revenue account" suggests a percentage of total statutory transfers based on total transfers in the past including both plan and non-plan. His objection is to Finance Commissions' recommending such total transfers since they are "discrete occurrence" and, not "a standing body" like the Planning Commission. There would be general agreement that if the revenue account is taken as one entity then one statutory body should recommend the total revenue transfers. Differences of opinion arise only as to which of the two existing bodies, Finance and Planning Commissions, should discharge this responsibility.

Guhan would like this one body to be the Planning Commission. However, the main function of the Planning Commission is planning which has to be a political process. The fact that Planning Commissions have been reconstituted whenever the parties in power at the centre have changed and that even plans have been terminated with such changes confirms this point. The Gadgil Formula sought to insulate non-statutory plan transfers from this process and make them also objective and transparent. There was, however, a contradiction between this objective and the objectives which central plan assistance was expected to achieve. It was, to some extent, playing a supplemental role to non-plan transfers effected through the Finance Commissions by assisting the states in having higher developmental outlays, but it also sought to ensure that such outlays were in keeping with national priorities. The Gadgil Formula helped in the former aspect by making these transfers also a kind of entitlement. But this defeated the latter purpose and, therefore, devices like earmarking had to be adopted. When this was considered insufficient, other devices came into being such as centrally-sponsored and central sector schemes which, in turn, abridged the scope of the Gadgil Formula. This has been a continuing grievance of the states. In the present dual jurisdiction over transfers a part, at least, of the transfer has been insulated from this controversy by its being statutory on the basis of the recommendations of a body not concerned with the plans. The Finance Commission need not, for instance, take into account the surpluses required by the centre for centrally-sponsored plan schemes while deciding the quantum of non-plan transfers to the states. If, on the other hand, the planning agency is made responsible for the total transfers from the centre to the states this may become a primary concern

in determining the magnitude of transfer. The total transfers may then become subject to the same kind of controversies as now arise in the case of plan transfers.

The characteristics that the existing institutions have, such as the statutory status of the Finance Commission or the continuing nature of the Planning Commission, are historical accidents and can be modified. The nature of the single institution we envisage for the future must, therefore, be determined not by these but by our view of the process involved. Once the distinction between plan and non-plan revenue expenditure is removed, do we wish the plan process to be based on a pre-determined sharing of tax resources between the centre and states, or should such sharing itself depend on decisions regarding the plan? This is, no doubt, an iterative process. In determining the distribution of tax revenues between the centre and states a view will necessarily have to be taken, not only of existing expenditure commitments but also of future requirements and the need to reduce disparities between the states. This is precisely what the revenue component of the plan is expected to do and this is the reason why we are agreed that the distinction between plan and non-plan revenue expenditure should be removed. On the other hand, no reasonable plan exercise can be done without an assessment of the financial resources available. Nevertheless, it is important that we are clear about where we wish this iterative process to start, at least in its constitutional aspect. When the distinction between plan and non-plan expenditure is removed and the constitutional responsibility of determining the shares of the centre and states in total central tax receipts is entrusted to a Finance Commission, it will have to project some plan goals, as the Ninth Finance Commission had done. Nevertheless in this exercise the final determinant of the transfers will be a judgment regarding adequacy of resources and the plan goals will be only one of several factors taken into account. If, on the other hand, a planning body is in charge of this process, the priority or urgency it attaches to plan goals will be the main determinant and the resource gap will be expected to be filled by optimistic assumptions regarding the availability of resources, such as buoyancy and additional mobilisation.

Let us forget the names and their association with our existing institutions. There are two different approaches here. The choice between these two approaches will depend on our view regarding the role and importance of the plan itself in future. If we have a permanent Finance Commission looking into the finances of the centre and the states and determining

vertical and horizontal transfers on the basis of objective criteria, considerations of financial prudence may prevail leading to a more restricted view of possible plan outlays. But, the states can then prepare their plans in a more autonomous manner because the total transfer of resources would have been already determined by this commission. The centre, in its turn will formulate a central plan, which would include provision for centrally-sponsored schemes intended to supplement the efforts of states in areas which are considered to be of national importance. The planning body can then be an expert body which will integrate these into a national plan. It can monitor these plans, as well as the economy as a whole, with a view to indicating the directions in which the states and the centre ought to be reformulating their plans and policies taking into account the various developments in the economy. In the Alternative Scheme, the Planning Commission is to be in charge of loans to the states and their capital plans. In another context the Reserve Bank has suggested a State Funding Corporation.⁷ In either case the planning body can integrate the capital plan also into the overall plan without necessarily being responsible directly for the initial formulation of any of the plans.

On the other hand, if we give the Planning Commission the constitutional status and mandate to determine both the vertical and horizontal sharing of central tax revenues, as well as of loans to the states, we would be imparting to it a strength which neither of the present commissions has today. In the heyday of socialist planning one issue that used to be discussed was whether we should also not adopt the Soviet practice of making the plan prevail over the budget. But even then this suggestion was not accepted and the question as to which prevailed was decided from time to time by which way the prime minister inclined. The suggestion made in the Alternative Scheme will, in fact, provide a constitutional framework for precisely this. Therefore, the judgment that we have to make now will be concerned with more than two institutions; it will involve a view being taken about the nature of planning in the future in the context of the new economic policy.

There is a hope expressed in the Alternative Scheme that the Planning Commission "linked as it is to the NDC" will be in a position "to develop a long-term federal consensus on the extent and pattern of transfers from the centre to the states and between the states...[then] settled policy can replace the quinquennial gamble on the personal views of five members". This hope is based on several assumptions in regard to the Planning Commission, its relation to the NDC and the method of

functioning of the NDC. The Finance Commission, on the one hand, and the Planning Commission, on the other, represent two different approaches to the settlement of inter-state issues. A review of the experience of the last four decades should help guide us in regard to the choice we have to make for the future. We have had, in the Finance Commissions, a kind of 'arbitration' or 'award' approach while the Planning Commission has had to adopt a more democratic approach of evolving a consensus. If the Gadgil Formula represents the result of the consensus approach and the various formulae evolved by the 10 Finance Commissions so far represent the results of the 'gamble on the personal views' of 50 individuals, there is no reason to regret the gamble, since the horizontal transfers under the formulae devised by the various Finance Commissions have been more progressive than plan transfers. The comparison here is not a straight one between those formulae and the Gadgil Formula because the effect of the Gadgil Formula has been diluted or vitiated by devices such as centrally sponsored schemes and externally aided projects.

The manner in which the Gadgil Formula was evolved and subsequently modified provides a good case study of the consensus approach in which the Alternative Scheme reposes so much faith. The initial evolution of this formula and its approval by the NDC is an example of the best aspects of the consensus approach. It was not easy to evolve a formula for the first time when there was none. The fact that this was done is a tribute to the respect which D R Gadgil commanded at that time and the stature and statesmanship of the chief ministers who were then members of the NDC. The first modification of the Gadgil Formula, which increased the percentage available for states with per capita income below the all-India average was a progressive one but it was adopted by a procedure which was in complete contrast to the manner in which the formula itself had been evolved. The modification was announced by the then prime minister, Indira Gandhi, in her concluding remarks to the NDC almost as an aside to the proceedings. On subsequent occasions when an attempt was made to modify this formula, a transparent procedure was adopted in evolving and considering various alternatives, first when D T Lakdawala was the deputy chairman and subsequently when Madhu Dandavate was in-charge and R Vaidyanathan was the member concerned. But on both these occasions no decision could be taken, as no consensus could be arrived at. When the formula was, in fact, modified subsequently it was done in the usual confused atmosphere.

These successive incidents are a commentary on the methods of obtaining a consensus. It would appear that in a democratic body consensus never really evolves but is often obtained by a process in which haste and confusion prevail over deliberation and clarity. The consensus is acquiesced in not so much because everyone accepts it but because no one has sufficient conviction or energy left to disagree. The element of a gamble, therefore, is as much there in this democratic dynamics as there is in the award process. The difference is that in one case there are 26 interested parties while in the other there are five perhaps opinionated but disinterested players.

One other aspect that has to be taken into account is that horizontal transfers involve distribution among the states who are members of the NDC. A consensus in such a body will, therefore, have to be the least common denominator of their conflicting interests. This generally weighs the formulae in favour of population such as the 60 per cent weightage in the original Gadgil Formula. The progressivity of the formula would then depend on the extent to which population itself is a good measure of this. The history of the attempt to modify the Gadgil Formula shows that in the consensus approach it is difficult to change the status quo even when it is perceived that this is necessary in the interests of equity.

In the Alternative Scheme it is stated that 'there will be no gap-filling-grants'. Once the transfer covers both plan and non-plan grants, the question of gap-filling will not arise. A gap arises only when the non-plan revenue account is looked at separately. If there is a gap at this stage, it is filled by Article 275 grants. In the case of the Ninth Commission, there were states in which no gap arose at this stage but it did arise when the revenue component of the plan was considered. This was then covered by a plan deficit grant. Therefore, if it is said that there will be no gap-filling when plan and non-plan are taken together, there can be two alternatives in the case of states for which a non-plan gap would have arisen under the present procedures. Either the plan will, in their case, have to be smaller if this gap is not independently filled or the total grant would have to be larger on the assumption that a certain size of the plan is necessary for that state, as was done by the Ninth Finance Commission. Once we take plan and non-plan together, gaps will no longer be visible as gaps. The question then will be, whether the revenue component of a state's plan will equal its available revenue resources, after the transfer from the centre made on other objective considerations, or whether a desired revenue plan outlay will be first

determined and the transfers so adjusted as to make this feasible. A gap grant will then get subsumed under plan grants, as is already taking place in the case of special category states.

The TFC scheme envisages plan grants continuing as at present. In the Alternative Scheme 'horizontal sharing criteria' which are 'broad-based' on certain factors are expected to cover both plan and non-plan requirements and there are to be no gap-filling-grants. However, no matter how much fine tuning is done in criteria-based sharing, there will always be some marginal inequity that can be dealt with only through specific grants. Grants will always be necessary to top up criteria-based share. Article 275 will therefore, continue to be required and will have to play a critical though not a major, role. The use of Article 282 for making plan grants has been the subject matter of controversy over the years. There is nothing in Article 275 Clause (1) to prevent plan grants being made under this article. Finance Commissions have been constrained from recommending such grants by their terms of reference and not the constitutional provision. On the other hand what has constrained the central government from making subsequent plan grants under this Article is the proviso under clause (2) that requires that the president shall make no order under this clause except after considering the recommendations of the Finance Commission under clause 3(b) of Article 280.

If this link between Articles 275 and 280 is snapped by deleting clause (2) of Article 275, then this article will stand on its own and can be used for making all types of grants-in-aid including plan grants. Article 280(3)(b) will remain and this will enable Finance Commissions to make recommendations in regard to grants-in-aid. These will then be considered by the central government like the other recommendations of the Finance Commission and action will be taken as envisaged under Article 281. All that will happen is that the constraint that clause (2) of Article 275 now imposes on clause (1) of that article will be removed without prejudice to the functions of the Finance Commission under clause (3) of Article 280. Article 282 need not then be used for the purpose of making plan grants and thus the considerable criticism that has arisen on this score would have been met.

The TFC has recommended that the share of the states in the gross receipts of the central taxes should be 29 per cent including existing tax rental arrangements. The Alternative Scheme suggests 'not less than 40 per cent, on the basis of the existing percentage of total transfers including plan transfers. Gulati's suggestion of transferring

domestic trade taxation to the states will result in approximately the same percentage transfer on the basis of existing receipts under union excise duties. These suggestions do not take into account the fact that at present plan transfers are taking place from a central deficit. We must remember that we are discussing statutory transfers. Obviously such transfers cannot be determined taking into account revenue deficits. It is true that the centre tries to use this argument to constrain statutory transfers while it abandons it when it comes to discretionary transfers. Nevertheless the fact remains that the level of statutory transfers must be related to gross tax receipts and cannot take deficits into account.

The centre's case in this regard has been vitiated by the fact that while it has imposed the discipline of not having a revenue deficit on the states, it has not itself observed this discipline. It has sought to justify this on the grounds that its deficit is incurred on account of plan expenditure a considerable portion of which again goes back to the states. It is this argument that provided a rationale for what Ashok Mitra used to say, viz that if the centre runs a deficit the states are also entitled to a share of it. What is cited as a constraint on statutory transfers cannot be ignored for discretionary transfers. We have, therefore, to make up our minds whether we are agreed that both at the centre and in the states we must work towards the goal of at least not having deficits on revenue account, no matter what our views on the magnitude of the fiscal deficits are. If this is agreed then it would be evident that the scope for increasing the level of statutory transfers is severely limited in the present situation. The 29 per cent recommended by the TFC is not sacrosanct but, equally, statutory transfers of 40 per cent will not be possible unless either the tax/GDP ratio goes up or the interest burden goes down or subsidies are reduced.

According to the calculations of the TFC, the post-devolution surplus of the centre in 1999-2000 will be about 14 to 15 per cent of its gross tax receipts in that year. The revenue plan assistance to states has been about one-third of the total revenue plan of the centre. If we assume that the entire revenue surplus will be utilised towards the revenue plan of the centre, one-third of this amount will be available for further transfers to the states which would come to five per cent of the gross tax receipts of the centre. Therefore, if we are not assuming any revenue deficit, the reasonable limit for the proportion of gross central tax receipts to be transferred to the states would be about one-third. This would include grants for state plans but would leave room for centrally sponsored and central schemes within the central plan as

at present. If the statutory transfers are constrained by the objective of not having a revenue deficit we could consider a provision for plan grants to the states over and above this, subject to the consequent revenue deficit not exceeding one per cent of GDP. This could be a transitional provision for such time as we are not able to observe the fiscal discipline of not having any revenue deficit. In the interim period, when we are still sinning, this will meet Ashok Mitra's old grievance that the centre alone was enjoying this particular sin.

As Gulati rightly observes, the TFC's scheme "fails to lay down the principles for the 15-yearly reviews to follow". This is because any principle now laid down may not be relevant in 2010. The period required for correcting the existing imbalance in the fiscal system would be 10 to 15 years. It is in this context that fixing the percentage for 15 years as recommended by the TFC acquires a rationale. That 15 years was expected to be from 1995; therefore, what it really means is that we should fix the percentage of transfers from the centre to the states up to 2010. With this fixed figure the centre and the states should now so manage their finances that a balance is restored in the system by then.

One expects that if this is done, then we may have a situation in 2010 which will be more conducive to determining a rational distribution of resources between the centre and the states. We can then redetermine this proportion taking into account, the tax capacities of the two in the economy as it would have developed by then and the responsibilities cast on the two by the unavoidable consequences of the new economic policies, given the constitutional division of functions. What can be agreed to now is that the statutory transfers from the centre to the states will hereafter be determined as a proportion of the total tax revenues of the centre and not on the basis of a division of the proceeds of any specified taxes.

A certain proportion of the gross central tax receipts that shall be transferred to the states can also be prescribed now for the period up to 2010. It would be worthwhile considering whether for this period the horizontal shares cannot also be incorporated in the Constitution, dispensing with quinquennial reviews up to 2010. In regard to the criteria for horizontal sharing, Guhan "wonders whether all this fine tuning is really worthwhile" and suggests that the same final result could have been obtained with "a simple and robust cocktail of 40 per cent for population and 60 per cent for the distance criteria". If there is general agreement on such a simple formula, then it should be possible to prescribe the

horizontal distribution also in the Constitution up to 2010. During this period then the only additional grants to states will be those that can be considered by the Planning Commission, taking into account the needs of the less developed or problem states and subject to a limiting provision regarding revenue deficit discussed above. Since there is likely to be general agreement regarding the pooling of the gross receipts of all central taxes, this can be a regular amendment to the Constitution. The other provision regarding vertical and horizontal shares can be a transitional one till 2010 when these percentages, as well as the procedures for future revisions, can be reviewed. The amendment can be so worded that, if in 2010 there is no agreement regarding the constitutional provisions for the future, then this amendment will lapse and the position as it is today will be restored, except to the extent of pooling of the receipts of all central taxes, if this is agreed to now.

In the context of the new economic policies attention has so far been focused in the fiscal field only on tax reforms. This is understandable since the existing tax system was the first hurdle to efficient fiscal management and economic reform. We have, however, now reached a stage where inter-governmental transfers' also need to be reviewed. In contrast to its imaginative and dynamic interaction with the states in the field of tax reform the centre seems to be diffident and pessimistic in this area. It seems to look upon the existing regime of fiscal transfers as a cross it has to bear for the fiscal sins of the states. Viewed against this background the far-reaching recommendations made by the TFC in its Alternative Scheme of devolution are

appropriate and timely. There are bound to be honest differences of opinion on an issue as complex and important as this. However, the above discussion shows that the basic feature of the TFC scheme, viz, the pooling of the receipts of all central taxes for the purpose of determining the share of the states, is likely to be generally acceptable. The World Bank has described the TFC report as "an encouraging sign for reforming inter-governmental fiscal relations". Therefore, what is needed now is a suitable mechanism for formally eliciting different views on the TFC scheme and examining these with a view to evolving a consensus. Under the existing constitutional provision a Finance Commission has to be appointed in June 1997. If action is not taken before then the old cycle will start once again and constitutional inertia will set in. The present opportunity is, therefore, available only till then and it is important to see that we do not lose it.

Colonialism and Geography

C Ramachandraiah

"Administration and exploitation go hand in hand" – Lord Curzon – Quoted in Dutt [1983:127].

SURVEYING and mapping of distant places, along with their varied features, was an important prerequisite in the colonisation project ('Cartography in Colonial India' by U Kalpagam, *EPW*, July 29). For, "right from the beginning colonised spaces were predominantly conceived as revenue generating ones". The great explorations and voyages in the world were encouraged and funded by the colonial powers with the primary goal of conquest, rule and administration. "The European colonial powers all directed their first efforts towards India and the wealth of India: they stumbled across America and the West Indies in the course of searching for the new sea route to India: it was only in the later period that they extended their expansion to Africa, Australia, China and the rest of Asia" [Dutt 1983: 7-8]. The geographical position of India vis-a-vis west Asia, East Africa, Indian Ocean, east and south-east Asia constituted India as 'the central fortress and base for the domination of this whole region, as well as itself comprising the richest source of wealth and exploitation'. Between 1876 and 1900, the percentage of territory belonging to the European colonial powers (including the US) went up from 10.8 to 90.4 in Africa, 56.8 to 98.9 in Polynesia and 51.5 to 56.6 in Asia. Commenting on these figures, Lenin said: "... the colonial policy of the capitalist countries has completed the seizure of the unoccupied territories on our planet. For the first time the world is completely divided up, so that in the future *only* redivision is possible, i.e. territories can only pass from one 'owner' to another, instead of passing as ownerless territory to an 'owner' [Lenin 1978:73].

Within the colonies, surveying was required to bring more areas and people under direct control together with more revenue generation. Thus extraction of more money – through land revenue, exploitation of raw materials, cheap labour and dumping of finished products, etc – from the colonies was the primary aim. Some infrastructure development also takes place in the process in the colonies also but only to the extent that it meets the exploitative requirements of the colonial power. The "extent of political and commercial advantages" was the main consideration in the establishment of main railway lines by the British in India. Without getting into the development of geography as an academic discipline during colonial

times, an attempt is made here to highlight how cartographic and geographic knowledge was put to use/misuse by the colonial powers to perpetuate their domination and justify their expansionist designs. The analysis is confined to only three aspects.

The Mercator's map projection developed in 1569 was extremely popular among navigators. They could travel long distances by plotting straight lines without the need for continuous adjustment of compass reading. Since shipping was the main mode of transportation for the next few centuries, this projection became very popular and continues to be popular even today. However, an important disadvantage of this projection is that, while maintaining correct shape, the size of an area gets enlarged progressively away from the equator. The countries in the temperate and high latitudes appear much bigger on this projection for a common observer. Thus India, which is otherwise 13.4 times bigger than Britain, appears only five times bigger on this projection and Greenland, which is eight times smaller, appears bigger than the whole of South America, and so on. The European powers, especially Britain, made extensive use/misuse of this projection to belittle the importance of the colonised countries and project themselves as bigger countries.

The life sciences-trained political geographer in Germany Friedrich Ratzel (1844-1904) applied Darwin's biological laws of natural selection and survival of the fittest to the States. He defined a State as an "organism attached to land" and like all organisms in nature, States also grow and that stronger States grow at the expense of weaker States in order to survive. A Swedish political scientist, Rudolf Kjellen (1864-1922), further expanded Ratzel's ideas, proposed 'geopolitics' as the theory of State as a geographic organism, and even justified wars as a legitimate means to expand territories.

The ideas of Ratzel and Kjellen provided a great fillip for post-war revival of their bruised egos for German leaders following their humiliating defeat in the first world war. They propounded a new discipline called Geopolitik and founded an Institute of Geopolitik with a soldier-turned academician, Haushaffner, as the head. A sustained propaganda was launched to mould German public opinion in favour of expansion of stronger States at the expense of weaker neighbours. Political geography as an academic discipline suffered heavily following the second world war. As Moonis

Raza put it: "The most disastrous consequences of Ratzelian environmentalism were felt in the field of *Politische Geographie* where it flourished like a weed at the hands of Kjellen, Mackinder and that charlatan who defiled Ritter's chair of Geography for a decade – Haushaffner. The seminal ideas of *Geopolitik* – this illegitimate child born out of an unsanctified wedlock between pseudo-geography and pseudo-politics – may be discovered in Ratzel's own writings – the State, as a quasi-natural organism rooted in the soil and expanding with it. This was the voice of German expansionism, which transformed the German State into an element of nature like the typhoon or the tide and gave to its imperialist designs the character of a natural law [Moonis Raza 1983:25].

The 'heartland' thesis propounded by Halford Mackinder (1861-1947), a professor of geography and member of British parliament, is perhaps the best known theory outside geography circles. Based on the physical geography of the world, Mackinder considered inner Eurasia, surrounded on the north by Arctic Ocean and the other three sides by mountains, as the 'heartland' inaccessible for sea power and crucial for world domination. The 'heartland' was later expanded to include the Baltic sea, middle and lower Danube, the Black sea, Asia Minor, Armenia, Persia, Tibet and Mongolia. The access to the 'heartland' was possible, according to him, only through the south-western Russia in eastern Europe. The landmass of Europe, Asia and Africa was 'World Island' which accounted for seven-eighths of the world population. Based on these considerations, he formulated a strategic formula for the Allied powers in 1919:

Who rules east Europe commands the Heartland;

Who rules the Heartland commands the World Island;

Who rules the World Island commands the World.

With the Soviet Union in command of the "heartland", he modified his theory and identified "Midland Basin" (comprising North Atlantic Ocean, eastern United States and western Europe) as an effective counterbalance to the Eurasian Heartland. This only highlights how geographical factors weighed heavily in the strategy for world domination by colonial powers. However, many of the 'geographical barriers' proved ineffective with the ushering in of air-warfare by the second world war.

An American professor, Spykman, however, found little substance in favour of 'heartland' theory. He considered those areas surrounding the 'heartland' – partly oceanic and partly continental – as 'Rimland' and more important for economic and strategic

control of the world with greater emphasis on sea power in global strategy. And gave a slogan

Who controls the Rimland rules Eurasia,
Who rules Eurasia controls the destinies of the World

As Dixit put it, With the emergence of the USSR as the sole master of the Heartland Spykman's prescription became the basis at least in part, of American policy of 'containment' of communist influence outside the Soviet Union. The different military alliances and treaties with the Rimland States in Europe and Asia have been a part of this American policy of 'containment' [Dixit 1988:119]

The advent of remote sensing and computer cartography has made surveying and map making a much easier exercise these days. One feels, however, sad to see that geography as a subject has not become very popular in Indian education system. Even in the premier institution in the capital, the University of Delhi, geography is taught only in a handful of colleges. It doesn't exist at all in the Central University of Hyderabad. The reasons for such a scenario may be many. In these days of media explosion, global village and shifting boundaries of 'non-states' it is not uncommon to come across overzealous

columnists writing an obituary for geography [see Das 1993]. Just as maps are not neutral objects (i.e., they do convey a meaning, a viewpoint, often political), the TV coverages of distant places or the communication network in the 'global village' are not neutral. It has a definite objective loaded heavily in favour of richer nations in the world. With its subcontinental size, diverse physiography, climate, resource base, cultural and economic practices etc., the need for Geography is much more in India today to understand, appreciate and forge a harmonious relationship. The decisions are political and implications are wider but they have to operate on a geographic space in a geographic environment.

On Guru's Dilemma

Tirthankar Roy

SUGATA MARJIT in an innovative article represents personalised knowledge transfer the instructional paradigm in most crafts. The guru's dilemma arises in a conflict between bequest of professional capital to the 'son', and maximising social returns to training, when a non-family disciple happens to be more talented than the son. The example here is Indian music, but the problem is general to any situation where craftsmanship is not, and cannot be, systematically coded. Needless to add, such situations have been common in India.

The purpose of this note is not to dispute that the dilemma exists, or can exist. However, an extended and nuanced analysis of personalised instruction will have to address a range of 'stylised facts' of which the dilemma is one. In what follows, I consider some of these which suggest that the dilemma was an exception rather than the rule. The context is primarily music, and the evidence inevitably in music-discourse, anecdotal. In a different context, say a more commercialised craft than music, these grounds may not hold.

(1) There is, first of all, something contrived about Marjit's problematic. His analytical tool is able only to model unconstrained pursuit of self interest, therefore the story *must be* one of constrained pursuit

of self interest. Yet the notion that the conduct of music is basically akin to that of a business firm just does not seem right. The belief that good musicians are motivated *as a rule* by the survival of good music rather than survival of the species, seems to me as fair a premise as any other. After all, good music has survived an incredibly long time. I see no ground, analytical or empirical, to give up the beliefs that (a) the reason was intrinsic to music and music-teaching, and (b) the dilemma was in itself a trivial problem.

(2) Marjit sees in patronage a compensation for the insider's loss if the guru does not discriminate. Patronage surely has an insurance function. But it has other roles too. Patrons can well be seen as discerning consumers who, being the aristocracy, could inform and enforce standards of craftsmanship, discriminate the more and the less talented. In a music market, the diversity and anonymity of the consumers weaken these features - information and enforcement - and can bring on a dilution of quality. More generally, the article ignores the consumer (listener).

(3) The institutional response from within music teaching to the dilemma was not the court but the guild, pervasive, partially at least for the reason that Marjit stresses, in all crafts. The word 'guild' has several

connotations. The one relevant here is perhaps the following. Coexisting with the continuity of family, continuity of 'gharana' can be a goal that circumscribes the 'ustad-shagird' relationship with a set of codes of conduct. These codes can be bent by individuals in case of progeny, but they are cases of guild-failures and need to be seen as such.

(4) The guru's dilemma arises when two distinct lineages, kinship and instructional, exactly coincide in the person of the son. In practice, however, they rarely do. A typical student has multiple masters in and out of family, just as a typical master has multiple students in and out of family. A study of the major gharanas in each of which one extended family constitutes the core, would show that even here father-son training is rather exceptional. Marjit does once describe the 'insider as son and relations'. As we know from everyday experience, the difference is rather drastic, and the rarity of 'son' and ubiquity of relations dilutes the argument a great deal. The distinct bond in most gharanas is probably not kinship, but generations that transcend kinship. Further, kinship itself is not a rigid attribute but an evolving one. It can be created out of instructional lineages, e.g. when daughters are married to students (as a rule they were in Muslim gharanas, possibly a major source of the latter's strength and perpetuation). In short, the guru's dilemma seems unusual even without non-family means of dealing with it.

(5) The coefficients that convert training into accomplishment need not be constant. A talented musician can, in principle, compensate for a training seen as deficient to that of a rival. Which raises the question how crucial, after all, are inherited training and repertory to the making of a great artist?

(6) Marjit observes that payment for training, upfront in this case, can be a compensation, but that it rarely exists. In fact, it does exist. Upfront payments, usually appearing as customary gifts, are inseparable from apprenticeship. In the form of the implicit apprenticeship contract, there are, seemingly, close parallels between music instruction, and the mode of training in several other urban decorative crafts of northern India where the ustad-shagird relationship had been central and more or less formalised. There is here an interesting study in comparison awaiting its cultural historian.

Notes

- 1 Transferring Personalised Knowledge: Guru's Dilemma. EPW XXX(27) July 8, 1995 pp 1663-65.
- 2 Not to mention that patrons could be students as well. From the late nineteenth century on, it seems hard to find a patron court almost anywhere in India where some members of the royalty were not students; several ended up highly accomplished. Music in this respect was different from other skilled crafts.

Public Intervention for Poverty Alleviation

Although there is a high degree of uniformity in the approach and content of poverty alleviation programmes, there is great variation across states in the outcome of these programmes. The reasons for this have been explored in a set of in-depth studies of poverty conditions and implementation of poverty alleviation programmes in nine states. The results of these studies, presented in this issue, suggest that if the strategies for poverty alleviation are properly planned and implemented, even without spectacular economic growth or a major overhaul of institutions and structures, poverty ratios can be brought down significantly. **2559**

While the eradication of poverty has been a recurrent theme of the Five-Year Plans, the proportion of those living below the poverty line has not declined significantly. The explanation for this must be sought in the political and administrative environment in which poverty alleviation programmes have been formulated and implemented. **2703**

Andhra Pradesh presents a unique case of poverty reduction between 1970-71 and 1987-88, its performance being ranked the best among all the states. This performance is understandable for the 1970s, during which period agricultural growth in the state was high, it is perplexing for the latter part of the 1980s when agricultural growth had considerably slackened. **2573** Bihar is not only poor and economically backward but is also a state where institutional barriers of all types - socio-economic, political, cultural, etc - are strong. The only ray of hope is the increasing awareness and mobilisation of the rural poor whose potential can be harnessed to improve the management of anti-poverty programmes and to pressurise the state into making structural changes. **2587** The experience of Gujarat shows that it is not enough to formulate a large number of innovative programmes and schemes for the poor. What is needed is a strong political commitment on the part of the state leadership to the poor and to a sustainable and healthy development of the state's economy. **2603** The Haryana experience suggests that sustained growth in agriculture plus a deliberate policy of income and occupational diversification is the most effective cure for poverty. **2619** The case of Karnataka shows that poverty alleviation programmes need to be seen as temporary measures - their success must mean that they create conditions in which they can be phased out. This implies that the growth processes in the economy have to be reinvigorated. **2635** The experience of Kerala, where the incidence of rural poverty declined in the 1980s in spite of the slow rate of economic growth, shows that it is possible to alleviate poverty through well designed and implemented programmes and that social protection for the most vulnerable groups must be a necessary component of development policy. **2651** In spite of the limitations in its design and implementation, the Employment Guarantee Scheme has made a positive impact on the levels of living of the rural poor in Maharashtra. Any replication of the scheme in other states must, however, involve the prior establishment of decentralised district planning and assurance of adequate funds through additional taxation. **2663** Examination of the functioning of poverty alleviation programmes in Rajasthan suggests that emphasis on infrastructural development, especially watershed development and reforestation, along with programmes of employment and asset redistribution, are most needed in this state. **2677** Land reform and decentralisation of decision-making through the development of panchayati institutions are not, the experience of West Bengal tells us, mere clichés, but are the preconditions for the success of poverty alleviation programmes. Also, there cannot be a lasting solution to the problem of rural poverty within the perimeters of the rural sector; the long-term solution lies in the transfer of a significant section of the surplus rural labour to the towns and industries. **2691**

Fiscal Transfers

S GUHAN has replied in the issue of September 9 to an earlier letter of mine (July 15). I hesitate to reply to a reply, but I cannot resist the temptation.

Guhan says, "I suppose no Finance Commission likes to dilute the originality of its recommendations". Finance Commissions are not academic bodies to be judged by their originality. They have a constitutional responsibility to discharge. Any such commission will have to strike a balance between the conventional, which has the advantage of having been accepted, and the novel or original, where this can move the status quo towards greater rationality or equity. Innovation within such constraints has to be incremental and not by quantum jumps. The work of a commission has, therefore, to be judged by its awareness of the ideas available and its willingness to consider them objectively. The suggestion of Raj Krishna, which is the subject matter of this correspondence, was original but his own commission did not accept it. The subsequent commission accepted it partially, while the Tenth Commission accepted it fully. This is the course an original idea has to take when it has to contend with objective realities.

Guhan's other grievance is that Raj Krishna had not been quoted in full. Once a source has been acknowledged the extent of quotation is a matter of style much like names nowadays—you can be Vishwanathan, Nathan or Dhan! As for the commission having thereby "missed the opportunity to gain strength for its views", it can only be said that the strength of the commission's recommendation lies in that what had been a minute of dissent in the original commission had now been fully accepted and implemented.

The other issue, which Guhan calls the more substantive one, has been dealt with by me more fully in a subsequent paper of mine ('Alternative Approaches to Devolution: Implications of Tenth Finance Commission's Scheme', *EPW*, October 7). It may be a fact that "the centre has miserably failed in enforcing collection of taxes shareable with the states" but we have to deal with realities. The central forecast for the Tenth Commission showed that the centre would have a deficit even before statutory devolution to the states. The commission recast this so as to leave the centre with a non-Plan surplus after devolution. The devolution works out to about 29 per cent of the tax revenues of the centre and the non-Plan surplus left at the

end of the exercise is a little more than 5 per cent. So, my point very simply is that, given this situation, we cannot have a *statutory devolution* of the order of 40 per cent of the tax revenues of the centre. As against the 29 per cent recommended by the Tenth Commission anything up to one-third would be a more reasonable figure for debate. In my later paper I have considered a contingency where, if the centre in any case runs a deficit for the Plan, it can be ensured that the states have a share of that deficit, much as what Ashok Mitra used to argue.

I am willing to concede a charge that I am accepting existing realities too readily. I do not know, however, whether this is necessarily "pro-centrist", as Guhan puts it. If it is, all I can say is that, as I have moved towards the centre, the centre seems to have receded. So in a relative sense I stand where I was.

As for my "experience as a finance secretary in a major state", I do not know what to make of my experience after having seen, as a member of the commission, all the major states as they now are.

In the days when Guhan and I still belonged to the service, there was a controversy whether a 'good' assessment in the stringent annals of Fort St George should not be equated with an 'outstanding' one in the facile files of the Gangetic valley. Two-and-a-half cheers from Guhan is, therefore, not a mean achievement in itself. I can hope for no more, I am, however, intrigued how exactly one raises half a cheer, though many try at the Red Fort on Independence Day. But I am sure that Guhan, with his

profound knowledge of classical music, will know this better.

On Accountability

HUMANSCAPE is a monthly magazine published by Foundation for Humanisation a public trust. It has completed two years. Its editorial board consists of Nissim Ezekiel, Linesh Sheth, Govind Shahani, Meher Pestonji, Manu Kothari, Bittu Sahgal, Rusi Engineer and Raju Moray. I plans to publish a special issue in January 1996, which will focus on accountability of elected representatives and citizens. People can send in their views on the following points: What do you understand by the concept of accountability? In the Indian political and governmental context who should be accountable to whom and why? Do you think there should be a law relating to political accountability? Should accountability be expected only from elected representatives? The courage to fight, to protest, to participate and to change is fast disappearing from this generation. How do we enthuse the citizens of our country to be accountable as citizens and also demand accountability from those who govern them? Please send your opinions (not more than 500 words) before November 20, 1995 to *Humanscape*, PO Box 26922, Santacruz West, Bombay 400 054.

Public Debt in Perspective

SINCE the initiation of the stabilisation and structural adjustment programmes in June 1991, there have been repeated reminders from the finance ministry and the Reserve Bank that the level of public debt was becoming unsustainable. The latest annual report of the RBI presents a review of the domestic public debt and takes a similar line. Earlier, the government of India's *Economic Survey* for 1994-95 had presented a more comprehensive survey of the central government's internal and external liabilities. The RBI takes the centre's external liabilities as given in the annual budgets which are at historical rates of exchange – a lacuna which the *Economic Survey* seeks to correct by estimating the government's external liabilities at current exchange rates. The correction is not a minor one, for the external liabilities so corrected and converted to current exchange rates (Rs 1,32,199 crore as of March 31, 1995 or 14.5 per cent of GDP) work out to roughly three times the size of external liabilities measured at historical exchange rates (Rs 49,508 crore or 5.4 per cent of GDP). The RBI does present data on the country's total external liabilities at current exchange rates in which the figure of government borrowings from abroad broadly match the *Economic Survey* figure (Rs 1,35,252 crore). Both of these, however, are exclusive of the Russian rupee debt, in particular the defence debt, to the extent of Rs 27,603 crore as of March 1995. The *Economic Survey* also presents some estimates of average rate of interest borne by the central government on different kinds of domestic and external liabilities. In one respect, however, the RBI data have an edge over those of the *Economic Survey* in that the former cover the liabilities of the state governments as well.

What is, however, most questionable is the RBI's blatantly pro-central government position *vis-a-vis* the state governments. The RBI argues that phasing out of revenue deficits is central to the reform of state finances. In the last two budgets, the total revenue deficit of states constituted only 27 to 30 per cent of their gross fiscal deficit, whereas their capital outlays and loans essentially to local bodies for development purposes constituted 48 per cent and 22 per cent, respectively. In the case of the central government, on the other hand, the revenue deficit was 62 per cent of its gross fiscal deficit in 1995-96 (BE), with capital outlays and net lending constituting 25 per cent each (with the difference of 2 per cent being disinvestment of shares). The RBI does not seem to realise that with rising developmental expenditures of the states and reduced grants and other transfers, their revenue deficit cannot be reduced. The RBI is responsible besides for imposing on the states an interest burden of 14 per

cent on their market borrowings this year, a 13.50 per cent two years ago.

Dealing with domestic public debt, the RBI's annual report argues that the reduction in the debt-GDP ratio for the central and state governments together from 62 per cent in 1993-94 to 61 per cent in 1994-95 and further to 60 per cent in 1995-96 (budget estimate) "is mainly on account of the efforts of the central government to scale down the gross fiscal deficit to GDP ratio to 5.5 per cent from an average of 8.2 per cent during the second half of the 1980s". The decline in the centre's gross fiscal deficit to GDP ratio has been marginal, from 8.33 per cent in 1990-91 to 7.66 per cent in 1993-94 and 7 per cent in 1994-95 and the figure of 5.5 per cent budgeted for 1995-96 is likely to be substantially exceeded. The total internal liabilities of the central government as a percentage of GDP have in fact grown from 52.9 per cent in 1990-91 to 53.9 per cent in 1994-95 and the budgeted figure of 52.1 per cent for 1995-96 is sure to be exceeded. The state governments, on the other hand, have maintained the ratio of their outstanding liabilities to GDP at about 20 per cent throughout the period from 1989-90 (20.4 per cent) to 1994-95 and 1995-96 (20.2 per cent). If the centre's external liabilities at current exchange rates are taken into account, its total liabilities as per cent of GDP will be seen to have gone up from 65.2 per cent in 1990-91 to 70.4 per cent in 1993-94 (RE) and 67.7 per cent in 1994-95 (BE).

The RBI and the finance ministry have been apt to take an alarmist view on the issue of public debt. In the first place, many countries have much larger public debt to GDP ratios than India, even exceeding 100 per cent, whereas India's public debt of the central and state governments together, taking domestic and external borrowings at current exchange rates, will not currently exceed 75 per cent of GDP. As many studies have pointed out, it is not growth in debt *per se* that is responsible for the malaise of heavy debt service burden and inflation; rather it is the underlying fiscal situation, the purposes for which the borrowed funds are used and the debt management and interest rate policies that are pursued which determine the long-run sustainability or otherwise of a given size of public debt.

The RBI takes the view that the accumulation of debt at the current pace will have serious implications for the central and state budgets in terms of higher interest payments as well as higher monetisation. There are two aspects of this increased debt service burden which have been created by the RBI's blinkered policies. To begin with, even if market-related rates of interest had to be paid on government paper, they could have been much lower than the 14 per cent maximum

coupon rates paid on central and state government securities this year, they could have been lower all along the maturity spectrum. The average rate of interest on central government securities has shot up from 11.90 per cent in 1994-95 to 13.70 per cent in 1995-96 so far. Besides the issuing of too many shorter maturity securities in recent years has brought about a shift in the pattern of government debt towards shorter maturities which has given rise to both a relatively higher average interest burden and major humps in the projected repayment schedule. Many countries prefer to raise money through long-term bonds of 10-year to 30 year whereas the RBI has been telescoping government bond issues into shorter maturities. Having created the problem the RBI points out non-chalantly, with steep humps in the projected repayment schedule however, the government is likely to be compelled to go in for larger amounts of gross borrowings. This poses the danger of the vicious circle of higher market borrowings at a relatively higher cost chasing higher repayments. The RBI has sought to argue that while larger repayment obligations financed through gross borrowings would not affect the gross fiscal deficit in the particular year the concomitant interest burden would fuel the revenue deficit and the gross fiscal deficit in subsequent years. It has therefore become necessary to look at gross borrowing requirements rather than simply the net borrowing. All these complications are the fall-out of a blinkered policy framework.

Secondly and more significantly of the total outstanding liabilities of the central government what is denoted in budgetary parlance as 'internal debt', consisting of market borrowings, treasury bills and other securities, would constitute only one-half – Rs 3,07,369 crore (or 29.3 per cent of GDP) against total liabilities of Rs 6,00,330 crore (or 57.3 per cent of GDP) at the end of 1995-96. Two other major components are small savings (Rs 84,575 crore or 8.1 per cent of GDP) and provident fund and other accounts (Rs 1,25,872 crore or 12 per cent), both of which constitute voluntary or contractual savings of the community which are required to be encouraged. A significant part of the increases in the government's liabilities in recent years have taken the form of PF accumulations, government as well as non-government. There is no reason to look askance at such debt in a society where the overall saving rate is low and where it is necessary to promote such forms of saving, particularly because post-retirement and other social security arrangements are limited. It cannot be said that the payment of 12 per cent interest on

such savings is by any yardstick high. This underscores once again that it is not the size of debt as much as its nature and, more importantly, the uses to which it is put that matter. It is time for the RBI to reconsider its very conventional notions on public debt.

PANCHAYAT CONFERENCE

Plain Speaking from Below

THE Rao government's pre-election strategy to cajole rural voters by inviting their representatives to the lavishly laid-out All-India Panchayat Adhyakshas Sammelan in Delhi recently has come a cropper. Refusing to be overawed by the hortatory speeches of the ministers, panchayat leaders from different parts of the country did a little bit of plain speaking, exposing the hollowness of the claims made by the ministers. As one woman panchayat leader from Kurukshetra put it 'this is all a big natak – a tamasha of giving power to the people'.

The steady drone of promises made by VIPs ranging from prime minister Narasimha Rao (who addressed the second day of the conference) to his mates in the cabinet like Ram Lakhan Singh Yadav, Balram Jakhar, Jagannath Mishra and others was countered by a litany of protests and complaints by panchayat leaders who narrated their own experiences at the grass roots level. Even after 48 years of independence, they said, drinking water did not reach the villages. The panchayats had no say in the distribution of water or irrigation facilities. In Andhra Pradesh, the panchayats had no role in identifying the beneficiaries targeted under the Indira Awas Yojana. Representatives from Kerala wanted that at least 50 per cent of the resources should be vested with the panchayats. The proceedings of the conference was marked by booing of ministers by some from among the panchayat representatives, indicating the process of disillusionment that must have set in already in the much-propagated experiment of decentralisation.

Despite promises of decentralisation, ruling political parties, irrespective of their hues, seem to be reluctant to give up their control over local affairs in the states they rule and prefer to continue to rely on their loyal bureaucrats to keep a tight rein on the panchayats. The Andhra Pradesh Mandala Nyaya Panchayats Bill, framed by the erstwhile NTR government, which is awaiting the president's assent, for instance, provides for the nomination of five persons to each mandala nyaya panchayat by the district magistrate. The Panchayati Raj Act

of Karnataka, which was framed by a former Congress government there and still in operation, vests the supreme authority in the government officer, the chief executive officer of the zilla parishad, a not in its elected president. Even in Bihar the self-proclaimed champion of the rural poor chief minister Laloo Prasad Yadav has not cared to hold elections to the panchayat bodies – an aberration shared by Tamil Nadu chief minister Jayalalitha who, by withholding panchayat elections all these years, continues to control rural politics and administration through her henchmen.

But, among the ruling politicians the Congress leaders beat others hollow in the game of subverting all laws of decentralisation, and establishing party authority on panchayats, accompanied by hypocritical oaths of loyalty to the Gandhi dream of 'gram swarajya'. Even when Narasimha Rao was swearing by that oath at the Delhi conference of the panchayat 'adhyakshas' his own party persons ruling Orissa was busy dismantling the panchayats that had been elected during the previous Janata regime before the end of their term. The Congress-dominated state assembly in Orissa has adopted resolutions dissolving all the panchayats, panchayat samitis and municipalities in the state on the ground that these local self government bodies have been constituted in contravention of the provisions of the 73rd and 74th constitutional amendments and as such did not provide for reservations for scheduled castes and scheduled tribes. Yet the 73rd amendment itself specifically provides under Article 243-N that all the panchayats existing before its commencement shall "continue till the expiration of their duration". The Congress government's decision was evidently a move to get rid of the panchayats at the village and samiti levels, the majority of which were under the control of the opposition Janadals. Besides, the plea that they did not provide for reservation for scheduled castes and scheduled tribes is also specious, since the Orissa Panchayati Raj Act passed during the previous Janata regime, under which elections were held in the past, provides for reservation of seats for scheduled castes and scheduled tribes in every panchayati institution.

Rao's appeal at the Delhi meet of panchayat leaders to shun 'partybazi' in panchayati institutions therefore was a sham that was resorted to with the hope of fooling the rural audience through the projection of his image as a national leader standing above all party affiliations. But delegates at the panchayat conference, whether belonging to the Congress or the opposition, have gained enough experience by now to know that a

of the Rs 4,300 crore allotted to the panchayats for rural development from 1996, only crumbs will reach the villagers – and that also after the lion's share has been appropriated and shared by the local leaders of their respective political parties in connivance with the officials who are still allowed to hold sway over the functioning of panchayats

FUND/BANK MEETING

Evading the Issue

TRUE, the financial crisis in Mexico earlier in the year would be uppermost in the minds of the finance ministers gathering in Washington for the World Bank/IMF annual meeting. It was the crisis to meet which "the IMF responded with the largest amount of financial help (\$ 17.5 billion) ever extended to an individual member country". In fact, the latest Annual Report of the IMF already articulated this concern in great measure when it underlined the need for strengthening the Fund's financial resources. The argument is that to meet such situations the Fund requires access to more resources. In this context it is relevant to note that the Fund's liquid resources, comprising as they do its total holdings of SDRs and usable currencies, had fallen from SDR 68.7 billion in April 1994 to SDR 61.6 billion in April this year. And Mexico had drawn only one-third of the amount of financial support the Fund had committed to it. The Fund's Annual Report projects a sharp decline in its liquid resources over the next two years.

But how the Fund is going to be given access to additional liquid resources is the moot question. Will the Bank/Fund meeting in Washington come to any decision on this question? It appears extremely doubtful. At the mid-June meeting of the G-7, the select group of industrialised countries, at Halifax in Canada all that was agreed upon was a doubling of the GAB (General Arrangement to Borrow) facility from its present level of SDR 17 billion. The GAB facility is based on lines of credit from 11 industrial countries and Saudi Arabia. It is interesting to recall that when this special facility was originally created in 1962 then too there was concern about the adequacy of official sources of international liquidity and the disruptive effects of short-term capital movements, particularly among the industrial countries, and the idea was that access to the special facility being created would be open to any of these countries. The concern today also derives basically from the fear of the disruptive effects of short-term capital movements whose magnitude now is several times larger than that in early 1960s. The international financial market is the fastest

growing market in the world today and with that has "greatly increased the potential for a financial crisis to spread not only across national systems but across international borders as well". But would a mere \$ 50 billion GAB facility be adequate to deal with such a crisis? Let us not forget that Mexico alone had to be extended a commitment of that order.

The problem however is that the countries who matter in terms of their voting power in Bank/Fund decision-making are not willing yet to face up this question. So any hope of a major restructuring of the Fund's financial access, at this point at least, is bound to be still-born.

The fear that the Washington meeting is unlikely to come forth with more than what was agreed to among the G-7 at Halifax is based on past experience. In the recent past hardly has any suggestion or idea made any headway if it has not been first cleared by this group of powerful countries. Take the case of the proposal to double the SDR allocation from the present level of SDR 21.4 billion, which had the support of Michel Camdessus, the Fund's managing director. The proposal was rejected by the G-7 on the ground that it would infuse excess liquidity and have inflationary consequences worldwide – a fear that was totally unwarranted considering that the suggested additional SDR allocation would have increased the existing non-gold foreign reserves of the Fund's member countries by a mere 2.4 per cent. Here was a route open that could have been resorted to without each member country having to go for parliamentary approval. The Fund's charter permits the creation of SDRs, though by allocation to member countries in proportion to their quotas. And still any such move has been rejected again and again on flimsy grounds. Also, the question of quota review has gone on being deferred despite recognition all round that the supply of multilateral liquidity has lagged far behind the growth of even the value of world trade, not to speak of the phenomenal expansion in capital transactions across international borders.

In the circumstances, to pin one's hopes on the Washington meeting of the Fund/Bank members is to indulge in wishful thinking. The most likely outcome will be agreement on enhancing the GAB facility, as recommended at Halifax, and allowing access to this facility to non-members of GAB but under the strictest of conditionality. Let us not forget the emphasis on surveillance also. Whether a crisis like the one Mexico faced early this year will be possible to tackle through such a mechanism is a question that time alone will tell. The fact is that the Fund alone could not have tackled the Mexican crisis on its own steam.

Perhaps that precisely is the idea, namely, to keep the Fund hamstrung.

KERALA

Local Election Pointers

THAT the opposition front, the LDF, has done well in the recent local body elections in Kerala is accepted all round. If there is any dispute it is with respect to the extent of the front's victory and its significance for the elections to follow in the next six to nine months to both the Lok Sabha and the state assembly.

The Left Front has captured, or is set to capture, 10 out of the 14 district panchayats, 100 out of 152 block panchayats, 590 out of 990 village panchayats, 30 out of 54 municipal councils and all the three municipal corporations. So there can be no question about the solidity of the Left Front's ascendancy in the local bodies, urban as well as rural, in the aftermath of the elections. On the other hand, there can be some questions about the present ruling coalition's hold over the electorate in the constituencies which have gone to the Left Front. These questions arise because of the emergence of forces and parties which may or may not ally with the ruling front. The reference here is not only to BJP which will, for the first time, control one municipal council in Kasargode and be also a strong force to contend with in several of the municipal wards, particularly those in north Kerala, but also to the two other parties, the PDP and the INL, which broke away from the Muslim League and have done reasonably well in these elections in terms of the votes polled and the dents they could make in the League's pocket-boroughs. Even so, despite the pressures, the Muslim League and the Kerala Congress have broadly succeeded in holding on to their pockets of influence. The real loser in these polls has been the Congress(I).

But the much more interesting question that remains relates to the chances of the Left Front regaining power next year at the state level and also about the number of seats it can capture in Lok Sabha from the state. To what extent are the local elections a pointer to the elections to the higher level bodies? One has to remember in this context that in the last district council elections in 1990 the Left Front had a majority in 13 out of 14 districts and still in the elections to state assembly and parliament, less than a year later, the front lost badly. True, the latter elections happened to come soon after Rajiv Gandhi's unfortunate assassination which could have played a major role in swinging the sympathy vote to the ruling coalition.

But for precisely that reason, one cannot ignore how crucial it is to the fortunes of the two coalitions what the wave is at the time of polling. A swing of between 2 and 3 per cent can make a world of difference in Kerala. The Left Front, if it is to win the coming elections, has to make sure that whatever the wave, its direction is in its favour. At the same time, in the few months to go it must show that in the running of the local bodies its people acquit themselves well. It is a chance it must not throw away.

UTTAR PRADESH

BJP's Retreat

THE Bharatiya Janata Party (BJP) withdrew its support to the Bahujan Samaj Party (BSP) government in Uttar Pradesh on realising that any further continuance of the support would only aggravate the discontent within the party. The intention to deny Mayawati an opportunity to run a caretaker government and to prevent a possible adverse fall-out of supporting the BSP government on the urban electorate in the forthcoming urban panchayat polls might have determined the timing of the BJP's decision. Yet the disagreements on every major issue – whether it be reservations for minorities, the Krishnajanmabhoomi controversy, the Periyar mela or the transfer of IAS officials – had given ample indication that the two parties were pulling in opposite directions.

Ever since she assumed power, Mayawati set about establishing contact with the central leadership of the BJP, bypassing the state leadership. Kalyan Singh, besides feeling humiliated at being sidelined in such a cavalier fashion, had voiced the growing disenchantment of the party's rank and file with the hasty patch-ups the BJP's central leadership was entering into on crucial issues. Yet matters had not then assumed serious proportions to call for immediate attention. Two later developments forced the issue to the forefront. For all its failure to draw crowds, Kanshiram's Periyar mela was intended to take the battle into the BJP camp. Not only did the mela emphasise the ideological distance between the two parties, it also sent a clear message to the BJP leadership that it had no right to interfere in the state government's decisions as the BJP had extended unconditional support to the BSP government. This direct snub to the BJP leadership meant that it would be a spectator to the happenings in the state. Secondly, with the turmoil in the BJP unit in Gujarat gathering momentum, it was time that the BJP's central leadership paid heed to Kalyan Singh's warnings.

Though the BSP and the BJP had come together to protect their respective electoral

bases from Mulayam Singh's advance, the BJP expected more returns in propping up the first dalit-led government in UP. By projecting itself as pro-dalit, the BJP expected to make inroads into the dalit vote-bank. But Kanshiram by shrewdly using 'anti-Ram' Periyar to raise 'atma samman' amongst dalits blotted the BJP's hopes. On the other hand, the BSP, by conducting caste rallies, aimed to extend its support base amongst the backward castes in the state. The spectre that in its endeavour to gain access to the dalits, it might lose whatever base it has among the non-yadav backward castes ultimately prompted the BJP leadership to rethink its line of supporting the BSP government.

PAKISTAN

Pressures for Change

EARLY this week the Benazir Bhutto government arrested 36 senior army officers on charges of trying to foment an Islamic revolution. Although the official announcement states that the arrests have been made for purposes of investigation, it is clear that such large-scale action against the military would not have been taken unless the government were sufficiently convinced of the evidence to support the charges. Several factors have probably combined to bring about the current action.

The relations of the Bhutto government with the army have never been easy. While the military has always been a major factor in Pakistani politics, under Zia ul Haq's Islamisation process and the resurgence of fundamentalism the army acquired close associations with some of these groups including the more extreme ones. With the ascension of Bhutto and largely under US pressure, it was forced to come to an understanding with the new regime. Politically too it was prudent for the Bhutto government to go along with much of the Islamisation to the great disappointment of the small group of her liberal supporters. The government has also used the armed forces extensively to quell the growing unrest in the tribal areas against the moves to enforce Islamic laws rendering tribal norms obsolete. The Bhutto government's first act of intervening in the process of Islamic justice – the amendment of the blasphemy laws consequent upon the Supreme Court's decision which reversed the Islamic court judgment in the case of two minor Christian boys – coincided with Benazir's visit to the US and the reopening of the debate in the US congress over Pakistan's status as a state encouraging fundamentalist/terrorist movements.

The army has also been used extensively in quelling the Mohajir movement in Sindh,

particularly Karachi. The violence is not something concocted by the external media; its impact on life in Pakistan's commercial capital has been deeply felt. On the other hand, while the Mohajir movement and its well established system of meting out private justice, its torture cells, etc, have been in existence for long and have been given encouragement by the Pakistan People's Party (PPP) for its own gains, the current phase of escalating violence is a measure of the social and economic changes in the province. For, in a sense, without ethnic colouring the Mohajir movement represents the vocal and visible section of the nascent Pakistani middle class. Directly and indirectly it demands a breaking up of the feudal landlord system which has always been at the helm of affairs in Pakistani politics, whether through civilian governments or the military. If Benazir Bhutto's efforts at the conference table are to bear fruit she will have to confront the traditional systems which are her support base. This she has been reluctant to do and, unfortunately, the Mohajir movement is today in disarray and, as always happens when the focus of a militant movement gets diffused as a result of petty trade-offs with political parties, has taken recourse to mindless violence. It is thus unable to force Benazir to begin the task of fundamental social and economic change.

Another factor in the arrests is the situation in Punjab, where the PPP is in power in a coalition of assorted parties. The crisis was precipitated by attempts by the chief minister, belonging to the Muslim League (Junejo), to seek a meeting with the Muslim League (Nawaz). In the assembly of 240 seats the PML(J) has only 34 seats while the PPP has 100 seats. The threat to PPP has always been that the two factions of the PML may get together. Bhutto pre-empted such a situation by first ensuring that the entire PPP lot resigned and then ignominiously replacing the chief minister with another member of his party. But this does not mean that the PPP is secure and there continues to be a political crisis in Punjab.

Thus the situation was ripe for a military assertion of some sort. However, the US decision to resume military aid to Pakistan undoubtedly with conditions attached, strengthened Bhutto's hands and made the army more irresolute. But whatever be the external factors involved, there is no doubt that the internal turmoil in Pakistan is more deep-rooted than ever before, and its resolution is possible only by bringing about overdue social and economic changes. While it would seem that democratic institutions are slowly gaining strength, their survival depends on changes which the process of Islamisation may not accommodate.

CURRENT STATISTICS

EPW Research Foundation

Aggregate bank deposits and advances have spurred by Rs 7,529 crore and Rs 4,238 crore, respectively, as of September 29 over the previous fortnight, essentially due to half-yearly interest crediting. Reflecting the comfortable supply position, prices of food articles have been moving down. Foodgrains output in 1994-95 is now estimated at 191.9 million tonnes, 2.14 million tonnes higher than the target and 9.8 million tonnes higher than in the previous year. The rise of 6.1 million tonnes in wheat output was especially impressive. Production of pulses at 14.6 million tonnes was also a record. Foodgrain stocks were 34.7 million tonnes at the end of July against the seasonal norm of 22.3 million tonnes.

NAGARJUNA FERTILISERS

Rise in Sales

PROMOTED by Shaw Wallace in 1976, Nagarjuna Fertilisers and Chemicals was taken over by the Andhra Pradesh government and handed over to the Nagarjuna group in 1985. The company is engaged in the manufacture of ammonia and urea. It closed the financial year ended March 1995 with a sales turnover of Rs 843 crore up by 20 per cent from Rs 607 crore in the previous year. Other income rose from Rs 3 crore to Rs 20 crore as a result of increase in dividend and interest earnings. These increases were reflected in the total income of the company which went up by 51 per cent from Rs 616 crore to Rs 928 crore. On the expenditure side, there was an increase in manufacturing expenses as also in remuneration to employees. Interest costs came down by 8 per cent. A slight increase in the provision for depreciation and a zero tax provision saw the company end up with a net profit of Rs 193 crore, up by 51 per cent from Rs 129 crore in the previous year. A dividend of 18 per cent has been recommended by the directors, against 15 per cent last year.

During the year under review, urea production was 6.75 lakh tonnes, an increase of 17 per cent. Sales stood at 12.10 lakh tonnes against 7.21 lakh tonnes in the previous year. The excess of sales over production is explained by the trading operations of the company. The company is planning to double its urea capacity to 10 lakh tonnes per annum. The Rs 900 crore project is to be financed mainly through a Euro issue, internal accruals and debts.

The company has signed a joint venture agreement with Palma India of Israel for starting an irrigation company. A company by the name of Nagarjuna Palma (India) has been incorporated for the manufacture and sale of modern irrigation and water management systems. The technology for these operations would be provided by Palma India, Israel. Nagarjuna Fertilisers will hold a 70 per cent stake in the venture.

The company is also planning to get into steel and power generation. Coming up is a two million tonnes per annum, Rs 2,400 crore export-oriented hot rolled steel coil plant at Mangalore. The steel plant would be a 100 per cent export oriented unit and the company has made marketing arrangements with German Klockner. In the power sector, the company is planning to set up a 4,400 crore, 1000 mw coal-based thermal power plant at Nandikur in

Mangalore in collaboration with EMEL, an Italian company. EMEL will plan, erect, commission and operate the plant on a turnkey basis. The power plant will supply 350 mw power to the steel plant. The balance will be supplied to the Karnataka State Electricity Board. Also on the anvil is a 2,500 tonne sugar plant in Vietnam at an estimated cost of Rs 70 crore. The plant will go on stream in the second half of 1996. The company's aqua farm at Nellore has been commissioned. The company is establishing the Nagarjuna Agricultural Research and Development Institute near Hyderabad. It has been accredited with the ISO 9002 certification covering the complete range of activities from production to marketing of urea and ammonia. In recognition of its safety record, the company has been awarded the British Safety Award for 1994.

EID PARRY

Focus on Core Business

EID Parry, the flagship company of the Murugappa group, has diversified interests ranging from fertilisers, seeds, chemicals and sugar to industrial alcohol, sanitaryware and electronic goods. For the year ended March 1995, net sales of the company stood at Rs 502 crore, up by 11 per cent from Rs 454 crore. Total income rose by 26 per cent. Operating profit rose by 39 per cent from Rs 33 crore to Rs 46 crore. The company reduced its interest costs by 29 per cent from Rs 12 crore to Rs 9 crore. Despite higher provision for depreciation and tax, the company ended up with a net profit of Rs 23 crore, up from Rs 15 crore. The company has declared a dividend of 36 per cent.

Exports for the year stood at Rs 4 crore, up from Rs 3 crore. Imports moved up from Rs 48 crore to Rs 66 crore.

The pesticides division increased its sale by 15 per cent to 17 lakh litres. A technology development centre for pesticides was inaugurated during the year.

According to the company, the profitability of the sugar division was adversely affected by government policies of large scale imports of duty free sugar and indiscriminate increase in sugarcane prices. Both the company's sugar factories achieved higher production, viz., 1,04,084 mt compared to 61,939 mt in the previous year. But the surplus cane situation and restrictions on the inter-state movement of molasses and spirit adversely affected realisations. Anticipating no improvement in the situation, the company

has decided on captive consumption of alcohol in the production of acetic acid.

Aided by a general boom in construction activity, the ceramic division performed extremely well. Sales of sanitaryware reached an all time high of 15,034 mt with both units at Ranipet and Alwar operating at near full capacity.

The electronics division has put up a poor performance for the year under review. The division comprises Murugappa Electronics, which makes Meltrack brand audio cassettes, and Hilversum Electronics, which manufactures soft ferrites used mainly in the telecommunications industry. The seeds division reduced its losses during the year and is expected to improve its performance next year consequent on a sharper focus on key products coupled with a closer association with Dekalb Plant Genetics USA, its collaborators. The company is entering into a joint venture with High Value Horticulture UK for production of fruit crops exclusively for the export market. High Value Horticulture will provide know-how to EID Parry for crop management and train the Indian company's personnel. If the need arises, EID Parry will be provided marketing assistance by the British company. The agreement will be valid for a period of three years.

The company has tied up with IDL Technologies of Israel for setting up a captive desalination plant with a capacity of 1,560 kilo litre plant at its Fnnore factory. Through this move, the company hopes to reduce its dependence on Madras metro water and groundwater for its process requirement.

The company is setting up a power plant in Tamil Nadu at an estimated cost of Rs 46 crore. The project is expected to be complete by mid 1996/97.

The company is starting a new wall tile plant at Karaikal at a cost of Rs 36 crore. The plant, which is to have an installed capacity of 5,000 sq mts, is expected to go into commercial production by end 1996.

The company is entering the area of chemicals and the first chemical plant of the company, coming up in Tamil Nadu, has reached the stage of production. The plant will have alcohol as its base, which would be procured from the company's sugar factory at Nellikuppam. A project to make organic soil conditioner from the sugar factory seeks to convert municipal vegetable waste into organic manure and is awaiting approval by the concerned authorities.

The company completed its Euro issue during the year and raised \$ 40 million.

Expansion Programme

The automobile industry has been on the upswing in the past year. With economic growth percolating to the agricultural and industrial sectors, the market for light commercial vehicles both for transportation of goods and passengers has expanded. Bajaj Tempo, incorporated in 1958, is engaged in the assembly and manufacture of three and four wheeler light commercial vehicles and diesel engines. The Firodias and the Bajajs are the major stake-holders in the company. Daimler Benz Germany was a major shareholder until it sold its stake to the Firodias. Technical collaboration with Daimler Benz however continues. The company is one of the largest spender on R and D in the industry as per cent of sales and offers 38 models in all.

For the year ended March 1995, the company achieved a sales turnover of Rs 318 crore up by 6 per cent from Rs 452 in the previous year. Other income comprising interest and dividend earnings rose by 5 per cent. Total income rose from Rs 458 crore to Rs 495 crore. Non-operating profit rose from nil in the previous year to Rs 17 crore for the year under review. Interest costs came down by 10 per cent. Provision for depreciation and tax rose by 7 and 9 per cent respectively. Net profit rose by 25 per cent from Rs 13 crore to Rs 16 crore. Like in the previous year, the company has declared a dividend of 50 per cent.

The year saw a decline in exports by 49 per cent from Rs 9 crore to Rs 5 crore. Imports on the other hand moved up from Rs 28 crore to Rs 47 crore. There was an improvement in the orders on hand for exports as a result of the sustained efforts made by the company to develop selected export markets.

The company has embarked on a substantial expansion programme at its plants at Akurdi and Pithampur. The company is in the process of introducing the first Indian tractor to be equipped with 'syncromesh transmission'. As a part of the project, the company has entered into a licence agreement with Robert Bosch GmbH, leading German manufacturers of tractor hydraulics. The collaboration agreement has led to a special arrangement with Robert-Bosch GmbH for relocating manufacture of hydraulic equipment in India. The equipment will be produced in India by the company under a Bosch licence, for use on its own tractors and will be exported to Robert Bosch for meeting their marketing requirements worldwide.

Gap in Busy Season Credit Policy

The resource position of banks in the coming months is likely to be very tight – a prospect which has been hardly addressed by the busy season credit policy. This has formidable implications for the money, credit and debt markets in the second half of the financial year.

I Credit Policy

A CONSPICUOUS gap in the monetary and credit policy statement of the Reserve Bank of India (RBI) for the second half of 1995-96 made at a bankers' meeting on September 29 is the absence of revised projections of likely growth of aggregate bank deposits in the fiscal year 1995-96. In the policy statement of April 1995, the RBI had placed the working estimate of the expansion of bank deposits for the year at Rs 65,000 crore (17 per cent) over the base of March 31. Contrary to the past tradition, the latest policy statement makes no mention of the possible size of deposit growth. Around this time last year, the estimate for the full financial year 1994-95 was revised from Rs 46,000 crore (14.6 per cent) to Rs 53,000 crore (16.8 per cent) and the final outcome was close: Rs 53,630 crore (16.1 per cent) on March 31 to March 31 basis or Rs 51,566 (16.4 per cent) on March 18/17 basis.

The authorities' reluctance to stick their neck out on the banks' resource growth this year is understandable, for the imponderables in the financial scene are too many and, in any case, the trends in deposit growth are far behind the targets, which has something to do with the sluggishness in the domestic saving rate. No doubt since June this year deposit growth has picked up – an increase of Rs 12,538 crore so far against Rs 13,336 crore during the comparable period last year – but, first, foreign portfolio investments seem to have played a role and, secondly, the secondary growth arising from the strong injection of liquidity in the first half may to an extent be negated, unlike last year, by the loss of foreign exchange reserves arising from the growing current account deficit on balance of payments not being matched by net inflows on capital account.

Overall, the resource position of banks during the ensuing few months is thus expected to be extremely tight – a situation which has been hardly addressed by the busy season credit policy. Implications of this on money, credit and debt markets during the second half of the year will be formidable. There is a backlog of about Rs 16,000 crore

in gross borrowings of the central government or Rs 15,000 crore in net terms.

Apart from the pressure from government borrowings, the proposed disinvestment of government shares in PSUs to the tune of Rs 7,000 crore and the demand for non-food bank credit (which has just picked up with a rise of Rs 9,151 crore between end-June and mid-September as against Rs 6,610 crore in the corresponding period last year), are likely to place considerable strain on the liquidity situation – a feature already noticed in the last 10 days of September as reflected in the firming up of call money rates, and also following the shortage of foreign exchange in the inter-bank market, a depreciation of the rupee vis-a-vis the US dollar and even other currencies followed by a sharp increase in the forward premia for the dollar (Graph C).

Measures of Importance to the Money Market

The freedom given to banks to fix their own interest rates for domestic term deposits of over two years maturity may help banks to augment their deposits only marginally, particularly in competition with non-banking financial companies (NBFCs) but it will further go to reinforce the image of the financial system as a high interest-cost system which seems to have begun to impinge on the growth of productive sectors, particularly the medium- and small-scale industries.

The enhancement of refinance facility against government securities and other approved securities from 0.5 percentage point to 1 percentage point over the fortnightly average outstanding aggregate deposits of banks during the base year 1994-95 (as against 1991-92 in the past) – one half against the collateral of TBs at the refinance rate of 12.5 per cent and the other half against dated government and other approved securities at 14.00 per cent – may help banks in making use of their excess holdings of investments (worth about Rs 26,000 crore); the limits have been raised from Rs 1,025 crore to Rs 3,385 crore, i.e., by Rs 2,360 crore. The withdrawal of the Rs 15 crore limit on overnight open position of banks in foreign exchange operations may also help eventually

some of the bigger banks to make use of arbitrage facilities available in a situation of high call money rates in the domestic money market.

The other changes introduced are largely procedural: the flexibility given to banks in 85 per cent CRR maintenance daily; a minimum period of three days for repo arrangements with a view to making a clear distinction between overnight borrowings and repo transactions; and a uniform system of valuation of securities for statutory liquidity ratio (SLR) and balance sheet purposes (though operational issues involved may be formidable in ensuring 40:60 ratio for the marked to market method on a fortnightly basis).

II Government Market Borrowings

In the system of debt management, the massive borrowings in short-term debt last year have come home to roost in that the repayments have bulged during the current year. The redemption of 364-day TBs alone has totalled Rs 15,204 crore during the first half (April-September) of 1995-96, whereas the fresh collections under this instrument have been niggardly (Rs 1,397 crore). There was the redemption of another Rs 5,556 crore in respect of dated securities. Apart from these, there has been the compulsion for the government to issue dated securities in quick succession because of the agreement with the RBI for a ceiling of Rs 9,000 crore on recourse to ad hoc during the year. There have already been eleven issues of dated securities in the first half for a gross subscription of Rs 18,882 – as against 8 issues in the whole of 1994-95 for a gross collection of Rs 16,677 crore.

Since end-July the response to auctions of government paper has improved significantly but it has been mainly because of substantial injection of liquidity due to debt redemptions, particularly those of 182-day TBs, as stated above. For the next six months, the redemption of these bills will not exceed Rs 1,700 crore, of which Rs 1,365 crore will be in the months of October and November.

Novel Instruments

The raising of Rs 6,036.94 crore by floating new issues of dated securities during September has also meant the use of novel instruments by the RBI: a 14 per cent, 10-year government stock 2005 for which payments are to be made in four monthly instalments (September 11 to December 11); and a four-year floating rate bond (FRB) 1999 for which the interest

GRAPH A DAILY QUOTATIONS OF HIGHS AND LOWS OF CALL MONEY RATES, AUGUST 1995 AND SEPTEMBER 1995

GRAPH B Spot Quotations for the US Dollar in the Domestic Inter Bank Market

rate for any half year period will be 1.25 per cent over the average of 364 day TBs auctioned during the preceding six calendar months. The FRB, will fetch a floor rate of 13 per cent and for the half-year ending March 1996 the actual rate has worked out to 13.73 per cent.

The security to be paid in instalments was offered on tap without any notified amount but on September 11 it fetched Rs 4,482.63 crore in one single day and the window was closed on the very day the subscribers will pay Rs 1,121 crore each in four instalments.

Reportedly the success of the issue was more on account of some persuasion by the RBI. The paper is likely to be traded in the market only after it becomes fully paid. This was the third issue of the 10-year paper 2005 with the coupon rate of 14 per cent. It was issued thrice earlier this financial year, and second time on tap basis. In May and June, the government had collected Rs 3,709.66 crore through three issues of this security. Of this amount the market had contributed Rs 3,304.03 while the Reserve Bank absorbed Rs 946.95 crore. This was also the second

time that security-in-instalments was issued by the government, the first being in November 1994. At that time, the government could collect Rs 2,000 crore (bids received for Rs 4,375.50 crore) through an 8-year 11.50 per cent stock. Such securities are offered at a time when the liquidity conditions are not conducive for lump sum collections; they help issuers as well as investors in better funds management but the yield offered will have to discount the prospective money market scenario so as to attract the required subscriptions. Hence the highest rate of 14 per cent offered on this paper. In general, there is no gainsaying that the auctionary system has tended to stimulate market expectations regarding yield rates in all kinds of government paper.

The new issue of 4 year FRB on September 29 the first of its kind fetched Rs 1,544.31 crore. With the yield rate for the first half-year period ending March 1995 fixed at Rs 13.73 per cent, the RBI seems to have taken scrupulous care to ensure the relative smoothness of the yield curve in primary issues recent months.

Tenure (Years)	Yield (Per cent per annum)
2	13.50
3	13.65
4	13.73
(FRB)	
5	13.85
(ZCB)	
10	14.00

By linking the interest rate on this medium term paper with rate of return on a short-term TB and fixing a floor interest rate of 13 per cent, the RBI has made the instrument attractive. Linking the rate of return on the FRB to short-term paper would reduce the possibility of capital losses on these bonds. Additionally, the paper also offers ready forward facility. In a market where the interest rate scenario is uncertain and where the market is not willing to take a definitive view about the interest rates over medium and long term, a floating rate instrument which provides a hedge against the interest rate fluctuations has some preference over any fixed interest bearing paper.

The fixing of 364-day TB rate as the bench-mark rate for the medium-term paper has reopened the question of a 'reference rate' in the Indian money market. The RBI was hoping to actively promote the 364-day TB rate as the reference rate but with the narrow differential between the cut-off yield rates on it and that on 91-day TB, the absence of widespread interest in the 364-day instrument and limited number of bidders in all of its recent auctions, it is a moot point if there is as yet any merit in using this as a benchmark rate. There are also certain uncertainties with regard to the popularity of

GRAPH C ANNUALISED DAILY 6-MONTH FORWARD PREMIA IN PERCENTAGES FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET

GRAPH D YIELD CURVE FOR GOI DATED SECURITIES WEIGHTED AVERAGE FOR THE LAST WEEK ENDED SEPTEMBER 29 1995

he FRB in the secondary market. The uncertainty of the interest rates beyond six months on this instrument is likely to turn it into a six monthly instrument with a rollover facility. In other words, the market is likely to trade in this instrument only for the period that its interest rate is known. While during the year it may not cause much difficulties at the end of the financial year, bankers may find it difficult to properly evaluate this paper.

Treasury Bills

A noticeable development during September was the emergence of states as major subscribers at the 91 day TB auctions and a gradual withdrawal of banks in the auction process. It is reported that the implementation of the Tenth Finance Commission recommendations has resulted in larger central transfers to the states. Of the total Rs 2 500 crore raised through this instrument during

the month, non competitive bidders contributed as much as Rs 2 112.66 crore or 86 per cent, the corresponding amount last year was Rs 362 crore. In fact, the amounts actually bid by non competitive bidders this year was massively high at Rs 5 285 crore in the five auctions (Table 1). The state government along with provident funds were permitted to participate in 91 day TB auctions on August 8, 1994. Earlier, the RBI was automatically placing

the States' surplus funds in the tap TBS fetching 4.6 per cent return. The decision to allow states to profitably deploy their short-term funds was a natural corollary to the governments' central and states' paying market determined rates on their borrowings.

As the month progressed, the participation of banks dwindled both in terms of number and volumes. While on auction of September 1, 45 banks bid for total amount of Rs 706.85 crore, the number came down to 16 and Rs 179.5 crore on September 8, to 19 and Rs 107.42 crore on September 15, to 13 and Rs 47.75 crore on September 22, and finally to 7 and Rs 23 crore on September 29 auction. The cut-off yield has remained at a high level of 12.54 per cent in the first three auctions, before rising further to 12.67 per cent for the last two auctions.

In the case of 364 day treasury bills auctions, the response of the banks which continued to be lukewarm during the last few months turned very poor in the second half of the month despite a hike in the yield rate from 12.87 per cent on September 13 to 12.91 per cent on September 27 (Table 2).

Open Market Operations

The monetary instrument of open market operations (OMOs) veered towards being expansionary during September as the RBI purchased securities and injected about Rs 65.4 crore but was able to sell only Rs 0.14 crore worth of securities to the system. The RBI focused on offering long-dated securities for sale and given the uncertainty on the interest rate front, the market was unwilling to buy those securities. The prices at which the sale offer was made

each time were also not too attractive. As interest rates tended to firm up further, the RBI found it difficult to effectively wield this instrument without simultaneously giving an upward push to the already high level of interest rate structure. Consequently, the total turnover at the OMOs was only Rs 65.54 crore as against a higher volume of Rs 430.63 crore during August 1995.

III

New Issues of other Money Market Instruments

With the signs of easy liquidity prevailing since the middle of July following the maturing of large amounts of government and also seasonal return flow of funds into the banking system, the activities relating to the primary issues of PSU bonds, CDs, CPs and such other money market instruments got an impetus. However, the ICD market on which the small and medium-size companies depend the most, has gone into a tail spin with interest rates quoted in the market shooting up from the previous month's level of 22-24 per cent to even 30-34 per cent per annum. The phenomenon

of securitisation of debt is inching forward with one of the companies getting 'A' rating from CRISIL for its Rs 9.60 crore pass-through certificate (PTC) - a method of securitising receivables.

PSU Bonds

Partly as a seasonal phenomenon, the month of September witnessed flooding of primary issues by PSUs worth more than Rs 3,300 crore, mostly taxable bonds. Amongst the non-taxable bonds, the Finance Ministry has allowed the Indian Railway Finance Corporation (IRFC) to issue bonds worth Rs 500 at 10.5 per cent tax-free. IRFC also tried to place an amount of Rs 293.50 crore which was the balance amount from the 1994-95 budget. The offer received only Rs 60 crore. The Konkan Railway Corporation (KRC) has been permitted to raise Rs 370 crore through tax-free bonds.

In the taxable section, SAIL was reported to have entered the market with its Rs 40 crore bonds issue. The five-year bond with call and put options after three years offered 16 per cent as interest which was an indication of the improving liquidity situation in the market. The offer initially was Rs 300 crore with a greenshoe option to retain an additional Rs 100 crore. The issue netted Rs 500 crore.

PSUs are apparently now targeting wholesale investors, such as provident funds, for subscription to bond issues. SAIL has been the trendsetter in this area with NHP as a close follower. SAIL offered its 16.2 per cent issue to PFs after its Rs 265 crore issue which it sought to privately place with banks and financial institutions failed, and Indian Overseas Bank is reported to have subscribed an amount of Rs 25 crore for the failed issue. National Hydro Power Corporation (NHPC) offered Rs 125 crore worth of bonds of seven-year maturity at 16.25 per cent.

Nuclear Power Corporation (NPC) was planning to issue Rs 100 crore worth of bonds with six-year maturity and 16.25 per cent interest. The investors will have a call and put option at the end of four years. NPC had raised Rs 200 crore two months ago with a similar issue.

TABLE 2: AUCTIONS OF 364 DAY TREASURY BILLS

(Amount in rupees crore)

September 28	19	105.20	7	32.00	91.39	9.42
1995						
September 13	24	116.50	4	32.00	88.60	12.87
September 27	13	86.12	5	69.62	88.57	12.91

Meanwhile, the Krishna Bhagya Jala Nigam Limited's (KBJNL) irrigation bond issue of Rs 150 crore could not even net Rs 20 crore. The issue had been rated 'A' by CRISIL on the Karnataka government's backing and was the first tranche of Rs 800 crore, KBJNL intends to raise during the second phase of the project. Mahanagar Telephone Nigam Limited and National Thermal Power Corporation have, however, preferred to wait for the success of this before entering the market.

Amongst banks and financial institutions ICICI will be in the market with its Rs 500 crore non convertible debentures (NCDs) issue on October 15. The NCDs being privately placed are targeted at high networth individuals. ICICI will issue another Rs 500 crore in January. IDBI meanwhile offered a five year on tap issue (OMNI Bond Series II) worth Rs 500 crore at 15.75 per cent. Small Industries Development Bank of India (SIDBI) issued its sixth series of bonds for Rs 150 crore on September 27. These bonds with maturity of 10 years will carry an interest rate of 14 per cent. Dena Bank was also considering private placement of its Rs 55 crore bonds with a few financial institutions. The issue will help Dena Bank achieve capital adequacy ratio of 8 per cent by March 1996.

The Rajasthan State Electricity Board was set to raise Rs 600 crore by September 30 through sale and lease back transactions at an average cost of 10 per cent. SEBs in Madhya Pradesh, Punjab and Andhra Pradesh were also looking at this option with keen interest. It was reported however that the government had scoffed at such transactions and had issued a directive to PSUs not to indulge in such deals. Reportedly the RBI was also looking at such transactions with disfavour though it had not issued any directive prohibiting banks from contributing to any such debt instruments.

Debt Securitisation

The phenomenon of debt securitisation has been inching forward. It has touched the Rs 200 crore mark though mostly in securitisation of automobile receivables except two pools securitised by real estate developers. Also apparently only two of the 22 automobile securitised pools comprised truck and light commercial vehicles receivables. The rest all have securitised passenger car finance. A novel development in this area has been the pass through certificates (PTCs) worth Rs 9.60 crore by Alarcity Housing Limited, a housing finance company based in Madras, which was given AA rating by CRISIL. PTCs being issued by Alarcity represent securitised undivided interest in the pool of its identified receivables.

Certificate of Deposits (CDs)

The primary CD market was dominated by the financial institutions (FIs) prominently by IDBI and ICICI, who garnered more than Rs 1,200 crore during the month by offering interest rates of 15.15-15.5 per cent, considerably higher than the rates of 13.5-14.00 per cent offered by banks. The Tourism Finance Corporation of India also offered 15.75 per cent. These have hurt the deposit mobilisation efforts of banks who are crying foul against the absence of level playing field as the banks have to maintain CRR on CDs, whereas the FIs do not have to and hence are able to offer higher rates. In the reversal of earlier trend, banks themselves have been subscribing to CDs issued by FIs as not only do they carry lower risk weightage of only 20 per cent as against 100 per cent in case of corporate lending but also earn more than the prime lending rates. Among the banks, the largest corpus of Rs 1,300 crore worth of CDs is being issued by Union

Bank (P1+ rating from CRISIL) followed by Industrial Bank (Rs 270 crore). The primary CD market also received added boost from cash rich corporates which are diverting their funds from an uncertain ICD market to a more certain CD market.

In regard to the cash rich PSUs continuing to invest in unrated CDs of banks contrary to the norms set by the Bureau of Public Enterprises (BPE), the IBA has requested the RBI and the BPL to scrap those norms themselves.

Commercial Papers (CPs)

During the month, primary CP issues worth Rs 127 crore were planned by 10 companies, the largest issue being Rs 42.5 crore by Lloyds Finance in the interest rate range of 13.50-14.00 per cent. Most of these issues were made during the first three weeks of the month when call rates remained mostly stable. However, as the call rates started soaring during the last week, providing better opportunities, the banks did not participate in the primary market, hence only one CP issue of Rs 3.37 crore was slated during that period.

Inter Corporate Deposits (ICD)

The ICD market for corporates meanwhile saw firming up of rates as payment of advance tax was expected to soak up liquidity. The rates for A rated borrowers which were 17-18 per cent were expected to firm up to 24-30 per cent. Medium size companies were reported to have even borrowed at 30-34 per cent in this market. It is also reported that there have been significant downgrading of ratings for ICDs as well as for PCDs and FDs.

In an interesting development, Power Grid Corporation made a proposal to the government to allow it to increase its exposure in ICD market so as to enable it to raise its return on investments. The Union government

naturally was not very encouraging given the complex and unsecured nature of the market.

IV Money Market Operations

Call Money Market

Call money rate, enjoying relative stability at moderate levels since July, continued to remain so until the first three weeks of the month but started inching upwards towards the last 10 days; the rates pierced through the 12.5 per cent benchmark on September 20. Until September 15, call rates moved in the range of 10.50-11.50 per cent, except on reporting Fridays, mainly reflecting comfortable liquidity in general and large repo deals worth Rs 3,538 crore in the first three weeks. Of late, banks had been resorting to overnight repo deals, especially on reporting Fridays, to circumvent the CRR obligation. This loophole has been eventually plugged by the latest credit policy announced on September 29.

However, call rates started firming up as money started flowing out of the system in the form of advance tax payments and meeting large corporate lending targets so as to reflect a bloated half-yearly balance sheets of banks as of September 30. That more than expected outflow of tax payments had taken place could be gauged from the very low level of ad hocs at Rs 7,650 crore on September 19. Call rates which touched 13.5 per cent on September 18 scaled higher at 18.5 per cent on September 22 and 22 per cent on September 23, also due to the impending two-day bank employees' strike,

before started subsiding to reach 8.5 per cent on September 28 and 0.5 per cent on the last reporting Friday, i.e. September 29 (Table 3). Hence the last week of the month saw increased volatility in the rates (Table 4). The Reserve Bank was reported to have injected some liquidity into the market; There was, however, no evidence of this in rates. Besides, the RBI deputy governor, S S Tarapore had, categorically stated, at the DFHI Annual General Meeting that unlike last year when the RBI had provided large support to the market, it may not be possible for the RBI this year to provide unlimited support.

Foreign Exchange Market

The most significant development during September was the sudden and sharp fall in the value of the rupee vis-a-vis the US dollar which caught the market as well as the authorities totally unawares. From a stable rate of Rs 31.37 a dollar for about 14 months, the rupee rate was edging downwards in the first week but precipitately fell to Rs 33.75 on September 14 and touched to a low of Rs 35.15 to a dollar on September 15, which took the foreign exchange market into a tail-spin. Subsequently, the market stabilised at about Rs 33.60/33.80 to a dollar and stood depreciated by about 8 per cent. With the sudden scramble on the part of importers to cover their merchandise transactions which they had not done earlier, the forward premia for the US dollar shot up towards the last two weeks of the month (Graph C).

How the newly liberalised open position for banks from next January will help the stability of the exchange rate or whether it

would facilitate the arbitraging facilities between the money market and the foreign exchange market are difficult to predict at this stage. The RBI also announced a procedural change in its buying and selling rates for US dollar. From October 4, the RBI will no put out its US dollar buying and selling rate in the morning but will quote its spot buying rate for US dollar only on specific request from any authorised dealers. One day it did quote Rs 33.50 a US dollar on such a request.

Secondary Market for Government Securities

Following the RBI's directive for the bank to maintain current portfolio at 40 per cent for the year ending March 1996 and the further threat that this was only a transient arrangement as ultimately the entire portfolio will need to be marked to market, there has been increased secondary market activity in government securities, though with continued focus on short-dated securities in the wake of uncertainties on the interest rate front. In September, the transactions in regular securities were slightly more than in the previous month, while those in converted securities were the reverse (Appendix Table). The repo transactions during September at Rs 6,606 crore were phenomenally high, in August they were worth Rs 3,962 crore.

With increased transactions, the prices of government of India securities, which began looking up since July, improved further during September 1995 thus edging down the yield rates. In July last many a paper has enjoyed YTM's of over 14.0 per cent with correspondingly lower prices; in August the

(*) Means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in percent per annum * Yield rates of these sub groups of TBS and dated securities have been used for the graphs

Notes: 1) Yields are weighted yields weighted by the amounts of each transaction 2) Current yield has not been worked out for treasury bill

peak YTM was about 13.90 per cent and in September generally 13.80 per cent

Overall, the yield curves for the Government of India dated securities remained generally flat during September (Graphs D and E)

NSF Operations

The NSE operations in debt instruments (Table 5) during September were generally on a reduced scale as compared with the

past few months except for trading in commercial papers (CPs). In conformity with the renewed interest in primary issues of CPs, the secondary transactions of CPs on the screen based NSE totalled Rs 139 crore during a period of five weeks covering September as against Rs 12 crore in August and Rs 84 crore in July (four weeks each). Overall the NSE trading in all debt instruments aggregated Rs 1164 crore in September (five weeks) against Rs 1354

crore in August and Rs 1682 crore in July 1995. The decline has been particularly true of trading in government securities. A distinct aspect of the trading scenario in September was the absence of selling pressure, which is reflected in more of buy orders than sell orders.

[Statistical compilations and graphs for this note have been done by V P Prishmit Paramita. Debnath has prepared background notes on private debt instruments and money market rates.]

An *abridged* version of the last 180 days at Reliance.

Unaudited Financial Results (Provisional)
for six months ended 30th September, 1995

Sales	Rs. 3966 crores	+ 20%
Operating Profit	Rs. 842 crores	+ 18%
Cash Profit	Rs. 785 crores	+ 29%
Net Profit	Rs. 633 crores	+ 33%
Earning Per Share	Rs. 27.80	+ 19%
Taxes & Duties	Rs. 1205 crores	+ 32%
Foreign Exchange Savings	Rs. 2452 crores	+ 26%

Audited annual results year ended 31st March 1995: Sales Rs. 7019 crores, Net Profit Rs. 1065 crores

At Reliance we continue to accelerate performance in a liberalised economy through

- Creation of world class assets of Rs. 14 000 crores for the nation in less than 20 years
- Four fold growth in manufacturing capacity from 1.5 million to 6 million TPA
- Low cost globally competitive position
- A commitment to Total Quality

We thank our investors and customers who never settle for anything but the best. And our people, who set sights even higher.

The Government receives twice our profits as taxes and duties. We consider it a small way of repaying a nation that enabled us to become India's largest private sector enterprise.

Reliance
Industries Limited

Where growth is a way of life

Enron Episode: Lessons for Power Policy

Kirit S Parikh

The Enron controversy has raised four questions. How much is high plant availability worth? Why do we offer high rates of return without competitive bidding to control capital costs? Why do we agree to high load factor guarantees? What can we do to prevent such controversies and the associated delays in future?

WHATEVER may be the final outcome of the Enron episode, there are a few lessons to be learnt from it. To do that, however, we need to understand the main issues in the controversy.

THE DEAL

When the government opened up the power sector in 1992 the Enron Corporation of the United States was the first foreign firm to offer to set up a 2025 MW power plant. This was to be at Dabhol in Maharashtra.

The plant was to be set up in a fixed time period at a fixed cost. It guaranteed a 95 per cent availability. Enron was ready to agree to penalties for delay in construction as well as shortfall in availability. For any delay in supplying power Enron offered to pay \$ 14,000 per day for the first 180 days and \$ 1,00,000 per day thereafter. For any shortfall in plants performance capacity it will pay a one time charge of \$ 100 per KW. To the then government of Maharashtra, this seemed an attractive offer. Projects in India are seldom completed in time and substantial cost overruns are common. Also the availability of plants leave much to be desired. After extended negotiations, a power purchase agreement was signed between Dabhol Power Corporation (DPC) set up by the Enron Corporation and Maharashtra State Electricity Board (MSEB) the essence of which is as follows:

(i) The DPC will set up the plant in two phases. In the first phase, a 695 MW plant will be set up by 1997. In the first phase, the plant will run on imported distillate (a somewhat clean oil product). In the second phase, the capacity will be expanded to 2025 MW and the fuel will be changed to imported gas. The option to go ahead with the second phase or not rested with the MSEB and had to be exercised by July 1995.

(ii) The MSEB agreed to buy power at 7.5 cents \pm Rs 2.40 per unit in 1997 of which Rs 1.22 was towards capital charge and Rs 0.02 for operating and Rs 1.16 for fuel charges. The price agreement is in \$ terms. The capital charge and the operating charge (a total of Rs 1.24) has to be paid for 86 per cent of the time in a year whether MSEB purchases any power from DPC or not. For

subsequent years, this charge has to be escalated by 4 per cent per year.

The capital charge of Rs 1.22 per unit was arrived at to provide a rate of return that was considered satisfactory on the investment made by DPC. With the agreed price DPC expected to earn an internal rate of return (IRR) on equity of 25 per cent net of tax and 30 per cent before tax in dollar terms.

Guidelines subsequently issued on January 18, 1993 by the central government suggested a rate of return of 16 per cent on equity for a plant availability of 68.5 per cent and a bonus of 0.7 percentage point for every one percentage point increase in availability. Thus the 95 per cent availability of DPC's plant would get $16 + 0.7(95 - 68.5) = 34.5$ per cent return. The 30 per cent IRR hoped for by DPC is below this norm.

MAIN ISSUES

I had raised two main objections against this proposal. First, agreeing to a capital charge based on a rate of return without any control over total plant cost provides all incentives to overstate the capital cost of the plant (gold-plating). I also felt that the capital cost of the DPC plant was some 20 per cent too high. The second point is somewhat complex. While there was no compulsion on MSEB to buy power from DPC, the fact that capacity charges had to be paid 86 per cent of the time meant that if MSEB did not buy power for that much time the unit cost of power actually purchased would go up. Thus, suppose MSEB bought power only for 60 per cent of the time. Then the effective capital and operating charge would be Rs 1.78 ($= 1.24 \times 86/60$). To this we have to add Rs 1.16 as fuel charge. Thus the cost of power would be Rs 2.94 per KWhr. If on the other hand MSEB bought power to ensure a load factor of 86 per cent, its cost of power would be Rs 2.40 per KWhr. However, providing such a high load factor to DPC would imply that during off peak hours (at night) MSEB would be purchasing power at Rs 2.40 from DPC when it could be generating it from its own coal based plants at a marginal cost of 60 paise per unit. This would mean that MSEB would incur some Rs 180 to 270 crore per year of avoidable cost.

SOME MINOR ISSUES

A number of other objections have also been raised against the deal. These include counter guarantee given by the central government, fuel management fee, imported fuel, dollar payment, no condition for local content and environmental problems.

The counter guarantee given to Enron provides that if the MSEB cannot pay its bill to Enron, the government of India will do it and recover the money from the government of Maharashtra. This is reasonable as Enron can sell electricity only to MSEB and MSEB's finances are subject to the political influence of the state government.

The fuel price is to be approved by the MSEB and as long as MSEB is made to do this transparently there is no problem. The fuel purchase agreement provides for recovery of excess fuel charges if it is shown within 45 days that it could have been obtained at a cheaper delivered-in-time cost. This is fair.

A fuel management fee of \$ 2.5 million per year is payable to Enron. Compared to the fuel bill, it is a small amount. Some of it is justified and in any case it all comes to 1.5 paise per KWhr. It is the force of only marginal and secondary consequence.

The dependence on an imported fuel has also troubled many people, particularly that on imported liquefied natural gas (LNG). What will happen if the fuel supply is cut off? First of all, we depend on imported oil for more than half of our consumption. We will have to import fuels. So if you import some gas, that should be no additional problem. Secondly, the power plant is a dual fuel one, so if LNG supply is shut off by one supplier, we can import oil products from others and run it. Thus, as long as our exports grow and we are able to pay for imported fuel, importing fuel is not a problem.

INDIAN COUNCIL OF SOCIAL SCIENCE RESEARCH

Applications are invited for the award of Doctoral Fellowships in Social Sciences for the year 1995-96 under the following schemes

A. CENTRALLY ADMINISTERED FELLOWSHIPS IN THE FOLLOWING AREAS:

- 1 (a) Women's Studies (b) Medical Sociology/Medical Anthropology (c) Fellowships for Physically Handicapped/Disabled Scholars
- 2 Open Fellowships These are open to scholars both in research institutes and universities preferably on subjects with interdisciplinary orientation
- 3 ICSSR Foundation Day Fellowship
- 4 Fellowships for students of the North Eastern Region

B. INSTITUTIONAL DOCTORAL FELLOWSHIPS are tenable at

- (1) Sardar Patel Institute of Economic and Social Research Thaltej Road Ahmedabad 380054
- (2) G B Pant Social Science Institute Yamuna Enclave Sangam Vihar Jhansi Allahabad 221506 (3) Institute of Public Enterprise Osmania University Campus Hyderabad 500007 (4) Institute of Economic Growth University Enclave Delhi 110007 (5) Giri Institute of Development Studies Sector O Aliganj Housing Scheme Lucknow 226020
- (6) Madras Institute of Development Studies 79 Second Main Road, Gandhi Nagar Adyar Madras 600020
- (7) A N Sinha Institute of Social Studies Patna 800001 (8) Indian Institute of Education 128/2 J P Naik Road Kothrud Pune 411029 (9) Centre for Social Studies South Gujarat University Campus Udhana Magdalla Road Surat 395007
- (10) Centre for Development Studies Prasantnagar Ulloor Trivandrum 695011 (11) Centre for the Study of Developing Societies 29 Rajpur Road Delhi 110054 (12) Institute for Social and Economic Change Nagarbhavi P O Bangalore 560077 (13) Centre for Economic and Social Studies Nizamia Observatory Campus Begumpet Hyderabad 500016
- (14) Gandhian Institute of Studies Rajghat Varanasi 221001 (15) Centre for Studies in Social Sciences 10 Lake Terrace Calcutta 700029

Necessary details and application forms are available from the Institutes

ELIGIBILITY

- 1 Postgraduation in social sciences with at least 55 per cent marks
- 2 Candidate must have cleared National Eligibility Test (NET) for Junior Research Fellowship in social sciences held by UGC/CSIR
- 3 Applicant must be registered for Ph.D. or should be able to complete the registration formalities within six months of joining the fellowship
- 4 Selected scholars (for institutional fellowship) will have to be registered under the supervision of one of the faculty members of the respective institutes. Other things being equal preference will be given to schedule caste/tribe candidates

AGE

The upper age limit for JRF is 35 years as on 1.1.1996 (Relaxable by 5 years for SC/ST and women candidates). In exceptional cases where a candidate is found to have outstanding ability the age limit may be relaxed marginally at the discretion of ICSSR.

LAST DATE

The last date for the receipt of completed application form is 15th November 1995

VALUE OF FELLOWSHIP

- A Selected candidates will be paid a fellowship amount of Rs. 2500/- per month for the first two years and subsequently Rs. 2800/- per month plus Rs. 5000 per year as Contingency Grant Fellowship will be available for a maximum period of 4 years.
- B Under the Salary Protected Scheme employed scholar will get his/her salary for two years plus one time Contingency Grant @ of Rs. 5000/- P.A. The duration of this fellowship is two years.

ADMISSION PROCEDURE

Selection will be based on the candidate's past academic record and performance in the interviews conducted by the ICSSR or by the Research Institute.

APPLICATION FORMS

Further details and application forms can be obtained personally or by sending self-addressed stamped Rs. 5/- envelope (25.5 cms X 20.5 cms) to Assistant Director (Doctoral Fellowships) Indian Council of Social Science Research, 35 Ferozeshah Road New Delhi 110001

Bluebird

Many people are concerned that the agreement fixes the price in dollar and thus MSEB bears the exchange risk. Exchange risk is unavoidable and perhaps least expensive if we bear it. The most likely cause for depreciation of the rupee is if our domestic inflation is higher than our trading partners' inflation rates. In such a case even domestic fuel will cost more. And if we had built the plant ourselves using funds borrowed from international markets, we would have to pay back in dollars and would have to bear the exchange risk too. If DPC is asked to bear the exchange risk, it will factor in more than adequate margin in the price, and provide more than enough of a margin. The price will be much higher as it would be conservative. All one can ask DPC fairly is for rupee-price for that portion of its costs which reflect the rupee loan obtained from IDBI. Yet another point is that over the next 20 years, one should expect the Indian rupee to appreciate (as has happened in most fast-growing countries, Germany, Japan, Singapore, Taiwan, etc).

Finally, some have argued that we should have insisted that DPC buys its equipment from Indian manufacturers, e.g. BHEL. This is quite unreasonable. We can't expect DPC to adhere to a fixed cost and fixed time-table and tie down its hands. It must have the freedom to discharge its obligations. If we want to ensure self-reliance, we should see that BHEL has the technical and financial resources to compete on equal footing with others.

Self-respect does come by self-confidence to face competition. We must see that our firms, both public and private are equal to the best in the world. This would not happen by protecting them but only by exposing them, albeit in an open, transparent and a level playing field, to international competition.

If the country is serious about swadeshi and self-reliance, we need to take some difficult decisions. The need for foreign investment for the power sector arises because our SEBs do not have the financial resources to invest. Their financial sickness is the outcome of their pricing policies dictated by politics. They must reform prices. This means removing subsidy for agricultural and domestic consumers. As I had pointed out in 1993 while opposing the Enron deal, a 20 paise increase in price per unit can earn Rs 600 crore per year for MSEB. When leveraged in the market, it becomes Rs 2,500 crore every year, enough to finance the first phase of the Dabhol project every year. Without such price reforms, talk of self-reliance would remain just that. In the enthusiasm for swadeshi, one should not forget that our national corporations can be equally predatory given half a chance. The answer does not lie in swadeshi but in competition and transparency. If we have these, even MNCs won't be able to take us for a ride. If we don't, our own public and private sectors will fleece us.

Finally, concern about the environmental problems of the Dabhol plant have also been voiced. We should recognise that a gas based plant is the cleanest plant available, except perhaps a nuclear plant which has other problems. Some of our environmentalists seem to oppose everything. Hydel is bad as it submerges land, coal and oil are dirty, nuclear is dangerous and gas is dirty too. What is the alternative? I think, we need a macro-perspective. We need power. We can minimise the need but even then we will have to build some plants and accept some environmental consequences. We can try to minimise them but cannot eliminate them. Thus, I find objections on environmental grounds not very persuasive.

Thus, when we recognise that we need foreign private power as we do not have sufficient financial resources to put up all the plants we need, some of the issues raised above become peripheral. The main issues remain those of guaranteed return without a control on capital cost and of a high load factor guarantee.

MAIN LESSONS

What lessons can we learn from this controversy? The controversy raises four questions. How much worth is high plant availability? Why do we offer high rates of return without competitive bidding to control capital cost? Why do we agree to high load factor guarantees? What can we do to prevent such controversies and the associated delays in the future?

Higher availability of plants is useful as it helps meet demand with greater certainty. But, the high rate of return particularly the bonus of 0.7 percentage points for every one percentage point availability above 68.5 per cent offered by the ministry of power is ill-conceived. One can calculate the economic worth of higher availability. For example 11 plants of 200 MW each, with an availability of 68.5 per cent, provide the same degree of certainty in meeting demand as provided by one 2000 MW plant with 95 per cent availability. Thus 95 per cent availability is worth 10 per cent in capital cost and one can justify a 10 per cent higher rate of capital charge. Instead, the central government's formulae provides 18.5 per cent additional return! So the first lesson is to change that formulae to a more realistic figure of around 0.35 percentage point bonus instead of 0.7 percentage point.

If we are to assure a rate of return then we must make sure that the plant cost is minimised. Competitive and transparent bidding is a *sine qua non* of minimising costs of plants. Without open competitive bidding, the case by case approach can easily degenerate into a 'suitcase by suitcase' approach, the costs involved have to be eventually borne by the people of the country. Only with competitive bidding we get the benefit of competition and can provide a level playing field to both domestic and foreign entrepreneurs. Sometimes, it is argued that in order to invite competitive bids, we need to prepare detailed project proposals and we do not have adequate project proposals. If we had detailed project proposals, it would be useful but I do not think we need to have project proposals in order to introduce competition in this area. We can in fact invite bids only for the terms and conditions of power purchase agreements and leave the choice of fuel, plant, etc. to the entrepreneur.

It is possible to invite competitive bids for power purchase agreements. A simple way would be to invite bids for supply of power. One may say that 'we offer site A for setting up a power plant of say 2000 MW; the site would be handed over one month after the agreement is signed. Please fill out the form given'. The form may be as shown in Table 1.

Of course, other conditions and clauses on performance, shortfalls, enforceability, etc. have to be and can be built in such a scheme. In this scheme, the SEB need not get involved in questions of plant costs, internal rate of return, fuel cost, network costs, etc.

Thus the second lesson is to change the mind-set and think in terms of competitive bids for power purchase and not necessarily for power plants.

Why did the MSEB, one of the most competent and technically sophisticated SEBs in the country, agree to what amounts to a high load factor guarantee? I think, the explanation lies in the question that was perhaps posed to MSEB engineers. Perhaps they were asked 'Could you absorb the Dabhol plant power without hacking down our own plants?' But had MSEB been a private profit-oriented agency, the question would have been, 'What is the least cost with which we can meet the demand and under the optimal generation plan, what is the load factor for the Dabhol plant?' This would

TABLE 2: COST OF ELECTRICITY FROM A COAL BASED PLANT IN RS /KWHr (NET)
(ADJUSTED FOR 1997)

Load Factor	Capacity Charge	O and M Charge	Fuel Charge	Total
0.60	1.41	0.20	0.60	2.21
0.70	1.21	0.17	0.60	1.98
0.80	1.06	0.15	0.60	1.81
0.90	0.95	0.13	0.60	1.68

Assumptions: Capital cost Rs 4.4 crore/MW net.
Rate of Return 16 per cent on total capital.

have shown the true cost of Dabhol power and MSFB may have thought twice before agreeing to the deal. So the third lesson is make MSFB (and other SFRs) autonomous profit oriented non political entities.

While competition and transparency have to be encouraged one must recognise that even competitive bidding can be rigged. To guard against such bidding we must do our homework well. Only then can we negotiate better deals.

What is a reasonable price of electricity? To answer this we need to appreciate two things. First the demand for electricity varies from hour to hour and thus during hours of peak demand generating capacity is usually in critical supply. Second different types of plants have different costs of capacity and of generation. Thus a hydel plant may cost more but has virtually no generating cost. A nuclear plant has a very high capital cost but a very low operating cost. A coal based plant has a capital cost that is lower but an operating cost that is higher. An oil-based plant has the lowest capital cost but the highest operating cost.

Naturally one would have to strike a balance of how many hours each type of plant is operated. One should decide this in a way that it will minimise the cost of meeting demand. Some plants are more suited for meeting peak demands and others for meeting base load. Thus one has to compare the cost of meeting energy needs for different periods of time. For a plant which is to run only four hours a day we may prefer say a gas based plant as it has a low capital cost but if we need a plant to run round the clock a nuclear plant may be preferable as its operating cost is very low. We should therefore compare the cost of running Enron plant at different load factors with an alternative source of supply.

We should first understand what is our alternative. Forgetting for the moment the environmental differences of different types of plants and the problem of raising finances we can consider a coal based plant as an alternative. As per the parliamentary committee report on a comparable basis a coal based plant should cost between Rs 4 crore and Rs 4.7 crore per MW. Let us take Rs 4.4 crore as cost per MW net (i.e. excluding the plant's own electricity consumption). Based on the bid received for Chandrapur extension I had earlier estimated the capital cost on a comparable basis to be Rs 4.20 crore/MW net for a coal based plant.

Now if we provide a very generous return of 16 per cent on total capital we can work out how much electricity will cost us. The price of coal was Rs 550/tonne in 1994. With an escalation of 10 per cent per year in it and taking the norm of 0.75 kg/KWhr we can work out the cost of generation to be 60 paise per KWhr sent out of the power plant. To this we should add operation and maintenance cost which with escalation, would be 20

paise per KWhr at 60 per cent load factor. The cost of electricity is shown in Table 2.

One should note that by and large the assumptions are generous and the cost estimate should be an upper bound. We should ask Enron to match this. In doing so however, we should recognise that the availability of a coal based plant is only about 70 per cent and that of Enron's plant is 95 per cent and that coal is environmentally dirty with lots of emissions of suspended particulate matter and problems of fly ash disposal. We can give a higher price for cleaner plants. High availability of plants is useful as it helps meet demand with greater certainty.

Finally such controversies can be avoided by permitting the private plant operators to sell power directly to consumers. Then the government does not have to come in at all and the politicians and bureaucrats are kept

out. There is no need to sign a power purchase agreement. Competition will ensure efficient operations. Of course the private plant operators would want to supply power to the most paying customers: the industries. SEBs would be left with the responsibility of providing power to farmers, household and other not very profitable customers. This can be taken care of by imposing a surcharge on every unit sold to industry by the private plant operator equivalent to the cross subsidy provided to SFRs to their poor consumers. This surcharge can be handed over to the SEBs to meet their social obligation of supplying power to poor consumers. Thus the fourth lesson is more complete privatisation of generation and distribution.

Thus the main lesson from the Enron controversy is we need more privatisation and not less.

Gaslitand Disaster: Accident or Murder?

A K Roy

Three distinct crimes on the part of the mines management can be identified in the Gaslitand mine disaster: the failure to prevent the waters of the river, swollen by unseasonal rains, from flowing into the mines, that to take expeditious action to rescue the trapped miners and, finally, the slow pace of dewatering of the mines which has extinguished all hope of any survivors among the trapped miners – those fortuitously saved by air-pockets – being rescued. These failures, in their totality reflect the management's long-practised callousness towards miners' lives and well-being

ONE unseasonal rain on an evening, even if enough to cause a flood in Dhanbad or to drown some mines, should not be enough to explain the deaths of so many miners in the collieries. So there is a search for an answer. According to the official figures, 64 miners are buried under water in the Gaslitand colliery. In addition, four workers died in Katras Choutudih Colliery, three in Bera, two in South Govindpur and one in Nitchitpur colliery. They all belong to Bharat Coking Coal having 1.56 lakh workers (1 lakh in underground mines) producing 27 million tons of coal through its 92 collieries. Floods have always affected life overground, as in north Bihar and Bengal, but the mines underground used to remain untouched. Even the flood of 1978 which endangered the dams of the Damodar Valley Corporation and inundated railway tracks left the collieries undisturbed. What has made the difference between 1978 and 1995 so that a single evening's downpour on September 28 could take such a terrible toll in terms of life and property?

Whatever the explanation, the dimensions of the disaster indicate gravity of the menace. With the court of enquiry already announced, many revealing facts are expected to come to light. But even without such an erudite exercise, certain things are so evident that a verdict can be pronounced even now with reasonable confidence in its correctness. The rain water did one good thing. It removed the cover that hid one big weakness – that is, the officers in the nationalised collieries do not work, a charge wrongly levelled against the workers. The deaths clear everything. Every accident contains elements of human error. But when such error exceeds a limit and that too without any explanation, it becomes a crime. So the question that raises its head is whether the Gaslitand disaster was avoidable and, what is more, whether it was an accident or a murder as many have claimed.

Before going into the special features of the Gaslitand incident some general aspects of safety in mines deserve mention. There always exist some hazards in working in mines. So the stringent Mines Act was framed and an organisation named Director General of Mines Safety (DGMS) was founded by the ministry of labour to monitor its enforcement. The DGMS has wide powers

under sections 22 and 22A of the Mines Act and conducts periodic inspections. Such inspections numbered 9,653 in 1990, 9,941 in 1991, 9,974 in 1992 and 9,900 in 1993. The number of inspections is not enough to enforce foolproof safety measures, though. In addition, seminars are conducted and safety weeks are observed in the collieries. A meeting of the CIL Safety Board on June 22, 1992 took many lofty decisions. But all of them remained on paper and the meeting was reduced to a typical officers' fair.

The nationalised coal industry employed 7,82,930 persons (of whom Coal India 6,67,704) and produced 236 million tons compared to 78 million tons in 1973. There is a claim that since nationalisation accidents have been fewer and fatalities have decreased from 2.73 per million tonnes of coal produced in 1973 to 0.69 in 1993. In the advanced countries, like US, UK and Germany, the figure is less than 0.1. Even then the figures are deceptive, showing an erratic pattern. Increase in production since nationalisation is mostly due to open cast mines (80 per cent) where there is the least chance of accidents. In absolute figures, 149 persons lost their lives in the CIL mines in 1992, compared to 120 in 1991, 130 in 1990, 140 in 1987 and 157 in 1983. The ups and downs in the curve indicate the wild play of unknown factors in the matter of safety. The fact is that the expectation that nationalisation would save the mines and miners by eliminating slaughter-mining, ensuring sand-stowing, fighting underground fires, etc., was belied. After nationalisation the independent authority of the DGMS was undermined and the organisation began to be seen as an appendage of CIL – and the position was further downgraded after the DGMS was caught by the CBI taking a bribe.

Against this black background, Gaslitand has added a new dimension – that of naked corruption and criminal negligence not by any single individual but by the entire management, from the chairman and director down to the assistant manager who is supposed to be present in the pit on eight-hour duty in the evening shift. The danger in the mines may come from all the three states of matter – solid, liquid and gaseous – in the form of roof failure, inundation and

fire, requiring comprehensive safety provisions. The Gaslitand episode has added a fourth source of danger – morality and work ethics. One could understand the accident in the Kessergorah colliery (1975) of BCCI or the Taping colliery (1957) of CCI due to sudden roof collapse which led to the development of different methods of support and stitching. The accident in the Chasnala colliery killing 375 workers in 1975 occurred as the barrier separating accumulated water burst due to faulty map. This led to a thorough checking of old underground maps and the actual thickness of the barriers separating water levels by using bore holes and other techniques. Accidents are also caused by methane gas and carbon monoxide catching fire and poisoning miners as happened in the Sudamdih mine (BCCI) in 1975 killing 48 persons and more recently in the New Kendra colliery (ICL) killing 55 persons in January 1994. This led to the fabrication of various sophisticated instruments to indicate the presence and concentration of combustible and killer gases in the mines. But in Gaslitand nothing of the sort happened in the mine. Things happened outside and people died inside as those who were to stand in between and check the effect were absent from the work place. Is there any instrument manufactured anywhere which fosters a minimum sense of duty?

By this time many aspects of the Gaslitand colliery disaster have come to light. After visiting the spot almost everyone, cutting across political lines, was shocked. There was no element of surprise or suddenness in the episode. Nothing was beyond knowledge or anticipation. The Gaslitand mine is situated by the side of Katri river in Dhanbad district, 12 km away from the town where 92 miners were working in special seam No. 10 of pit No. 6 at a depth of 540 ft in the second shift of September 26. It had been raining heavily from 5 pm to 11 pm and 331 mm of rainfall had been registered, which was highly unusual. Even with much less rainfall the usual practice is to lift the workers out specially from the riverside mines. Why was this not done? To prevent the waters of the Katri river from entering the mines a dam had been constructed and a watchman was posted there – which means such possibilities had been anticipated. The dam was constructed with substandard materials and there was none to report when the dam was breached at about 10.30 pm and water started rushing into the mine through the mouth of number 4 pit and inundating all the pits. Just before this 28 miners came out of the mine and were thus saved while the rest remained trapped. Even then nothing happened in a flash as in Chasnala. The water level was gradually rising flooding the inside of the mine and the desperate miners sent signals from the bottom by ringing the bell asking for the lift to come out. The bell went on ringing for an hour till 2.30 am, indicating signs of life till then, but there was none to listen at the top and to act on that. After that

the bell faded away suggesting the end of everything. Was it an accident or a murder?

The explanation is being given that the boiler became cold as there was no cover or shade over it (why not?) and the steam pressure was inadequate to operate the lift. But the rain was continuing from 5 pm, why was there no vigil to ensure that the boiler did not become cold? Moreover, bringing a boiler to the normal position of raising steam does not take more than 45 minutes and here more than four hours time had been available. A shift consists not only of the workers but the supervisors and officers including the assistant manager, manager and engineers. Why were they not beside the trapped miners? Where were the general manager, the directors and the chairman for whom it would have taken hardly half an hour to reach the spot from their bungalows. There is a deep rooted feeling among the workers that had any big boss been trapped inside the boiler would have been ready within half an hour and the lift would have been operated. Everyone from the chairman to the general manager would have remained present at the pit mouth to direct the safety operations and bag the president's award.

The Gaslitand episode, whether an accident or a murder, would go down as the darkest spot in mining history. A heinous crime was perpetrated, maybe unintentionally, but the outcome of a long practised callous attitude towards miners' lives. It is as if the miners are not human beings and their deaths do not matter except in the form of payment of a paltry compensation. So the crimes continue and the unrepentant officers' association has been issuing provocative statements to prevent any punitive action against those guilty of gross dereliction of duty, presumably with the blessings of the top management. The first crime of negligence was compounded by that of delaying the rescue operation. It took more than 72 hours to stop the flow of the Katri river into the mines, something which could have been done within the 24 hours by mobilising the BCCL's huge fleet of earth moving machines. The third and worst crime is being committed in the form of the slow rate of dewatering, with the water level being lowered by no more than 3 ft per day. In other words, with the depth of water in the mine being more than 300 ft, it would take more than 100 days. In the process, extinguishing all hope of some of the trapped miners, those saved by air pockets - being rescued. In the Burra Dhemu colliery in September 1956, 11 workers were rescued after 19 days due to the presence of air pockets. In the sprawling Gaslitand mine there are expected to be many air pockets.

It is difficult to guess the effect, both moral and material, of the Gaslitand disaster on BCCL. Stature BCCL had been losing money at the rate of Rs 1 crore per day even before Gaslitand. Already a section of the top officers have been spreading the word that BCCL could not survive and so should be closed or privatised. With this attitude the officers

have failed to give the leadership in every crisis, whether in Dugdha (August 21) or Gaslitand (September 26). Another section of officers had been advocating reckless use of Article 28 of the Standing Orders which gives arbitrary powers to dismiss workers without any enquiry with a view to teaching duty and discipline to the workers by terror.

But now when Gaslitand has shown who are dutiful and disciplined and who are not, there should be a new start, resurrecting the good old 'half pants' culture of the collieries with the workers and officers believing in one another and in the future of BCCL, moving hand in hand in a new spirit of solidarity, washing away the dead past.

Dalit Women Talk Differently

Gopal Guru

The independent and autonomous organisation of dalit women has the potential to counter dalit patriarchy from within and state-sponsored globalisation from without

OVER the last several decades women's issues have become a part of global public agenda. While it is due to their ceaseless struggles that women have acquired visibility at the global level, women's assertion assumes particular expression by operating on a particular terrain shaped by forces of a particular country. The scenario of the women's movement in India, particularly in the context of the Beijing conference, is characterised by simultaneous mobilisation of women by different autonomous feminist groups and by groups affiliated to formal political formations. In a situation where the organisation of politics around difference has become a major feature of feminist politics, the organisation of dalit women around the notion of difference is bound to be a logical outcome. An independent and autonomous assertion of dalit women's identity found its first expression in the formation of National Federation of Dalit Women (NFDW) at Delhi on August 11.

In order to understand the dalit women's need to talk differently, it is necessary to delineate both the internal and external factors that have bearing on this phenomenon. Some women activists apprehend that contingent factors like the upcoming Beijing conference were responsible for the national level meet at Delhi. It may be true that the all India mobilisation of dalit women, which is a culmination of such conferences previously held at Bangalore, Delhi and Pune during the last couple of years, was visualised by the dalit women activists keeping in view the representation of dalit women to Beijing conference. However, the issue of representing dalit women, both at the level of theory and politics, has erupted time and again in the discourse on dalit women. Dalit women justify the case for talking differently on the basis of external factors (non-dalit forces homogenising the issue of dalit women) and internal factors (the patriarchal domination within the dalits).

Social location which determines the perception of reality is a major factor (as we shall see in the context of argument made by dalit women) make the representation of dalit women's issues by non-dalit women

less valid and less authentic. But this claim of dalit woman activist does not mean celebration of plural practices of feminism. However, there are feminists who seek to understand the need to talk differently, keeping in mind certain external factors. For example, Gail Omvedt would link the dalit need to talk differently to the left force to the betrayal of the promises given to the dalits by the latter. Rajni Kothari shares the same opinion but rather differently. He says,

With the erosion of institutions, the unsettled controversies over public policies, and the growing uncertainty over ideological issues, as well as the decline of democratic functioning of the political process, faith in the capacity of the modern nation state to provide a framework of both order and equity has declined, and so too the reliance on mainstream governmental and party political process. The result has been the rise of a series of movements as distinct from the earlier gains of more specific economic movements such as trade union or co-operative movements. Kothari calls this phenomenon of 'talking differently', discourse of descent.

But focusing on certain external factors does not provide access to the complex reality of dalit women. For example, the question of rape cannot be grasped merely in terms of class, criminality or as a psychological aberration or an illustration of male violence. The caste factor also has to be taken into account which makes sexual violence against dalit or tribal women much more severe in terms of intensity and magnitude. This differential experience was expressed by dalit women activists at the Delhi meet and also previously at a conclave organised by Satyashodhak Mahila Aghadi in Maharashtra. However, these activists lament that the caste factor does not get adequate recognition in the analysis done by non-dalit, middle-class, urbanised women activists.

Dalit women did appreciate feminist radicalism in the early phase of new peasant movements in Maharashtra. Yet, they did not approve of the ultimate subordination of the dalit voice to the dominant voice of the Shetkari Sanghatana in Maharashtra and the

Rayat Sangha in Karnataka They questioned the populism of these peasant movements, who, representing the interests of rich farmers, entered into direct contradiction with the interests of dalit agricultural labourers over the issue of minimum wages.

Secondly dalit women would not make common cause with the 'moral economy' advocated by the Shetkari Sanghatana and its feminist supporters. They are of the opinion that the moral economy of the Sanghatana offered no solution to their poverty, instead it sought to naturalise their poor living conditions. Dalit women are also not well disposed to the eco feminist call for development of environmental consciousness. In fact dalit men and women from Kannad taluka of Auringabad district uprooted saplings planted by the social forestry department. Now some environmentalists might remark that these dalit women lack ecological understanding. But the fact of the matter is that these dalits have been denied legitimate piece of land from the ceiling land which the village landlords still control. Further the dalits do not have equal access to common property resources of the village. In fact the experience of gram panchayats in Uttar Pradesh shows that an egalitarian distribution of landholding is a precondition for tension free management of forest resources.

Thirdly the claim for women's solidarity at both national and global levels subsumes contradictions that exist between high caste and dalit women. The latent manifestations of these contradictions involve subtle forms of caste discrimination as practised by upper caste/upper class women against dalit women in the urban areas and resorting to slander of dalit women in rural areas. The contradictions also take a violent form as when the Shiv Sena women attacked dalit women in Sawali village of Chandrapur district in 1988. Thus beneath the call for women's solidarity the identity of the dalit woman as dalit gets whitewashed and allows a non-dalit woman to speak on her behalf. It is against this background that dalit women have of late protested against their guest appearances in a text or a speech of a non-dalit woman and instead organised on their own terms. They consider the feminist theory developed by non-dalit women as unauthentic since it does not capture their reality. This comprehension gets clearly reflected in the 12 point agenda adopted by the NFDW and in several papers presented by the dalit women at the Maharashtra Dalit Women's Conference held in Pune in May 1995. Dalit women define the concept of dalit strictly in caste terms, refuting the claim of upper caste women to dalithood. Dalit women activists quote Phule and Ambedkar to invalidate the attempt of a non-dalit woman to don dalit identity.

DALIT PATRIARCHY

Besides these external factors, there are certain internal factors that have prompted

dalit women to organise separately vis-a-vis the dalit men. In the post-Ambedkar period, dalit leaders have always subordinated, and at times suppressed, an independent political expression of dalit women. This political marginalisation has been openly condemned by dalit women at the regional conferences of dalit women and at the Delhi meet.

It is not only in the political arena that dalit women face exclusion. In the cultural field for instance dalit women have criticised their male counterparts for dominating the literary scene. Dalit male writers do not take serious note of the literary output of dalit women and tend to be dismissive of it. Dalit women rightly question why they are not considered for the top positions in dalit literary conferences and institutions. This dissent brings to fore three things. (1) It is not only caste and class identity but also one's gender positioning that decides the validity of an event. (2) dalit men are reproducing the same mechanisms against their women which their high caste adversaries had used to dominate them. (3) the experience of dalit women shows that local resistance within the dalits is important. The whole situation compels us to defend the claim of dalit women to talk differently.

Firstly defended independent assertion of dalit women should not be viewed by dalit men as divisive. Instead, it ought to be seen as carrying positive emancipatory potential. It can lead to a meaningful engagement of their creative energies. Secondly, the autonomous mobilisation of dalit women can also be understood from an epistemological standpoint. This perspective maintains that the less powerful members of a society have a more encompassing view of social reality than others because their disadvantaged position grants them a certain epistemic privilege over others. It has to be noted that though there are some non-dalit women activists sensitive to the caste dimensions of women's exploitation their stand has remained ambivalent regarding the critique of caste.

Dalit women claim to talk differently assumes certain positions. It assumes that the social location of the speaker will be more or less stable, therefore talking differently can be treated as genuinely representative. This makes the claim of dalit woman to speak on behalf of dalit women automatically void. In doing so, the phenomenon of talking differently foregrounds the identity of dalit women.

Though it is difficult at this stage to make any definitive comments on the dalit women's movement, one can question the validity of the above assumptions. There is a notable shift taking place in the location of dalit women. Dalit women from Maharashtra are better educated and employed than their counterparts from Karnataka. And it would be the former who would represent dalit women at Beijing. Thus here too a certain section of dalit women will be rendered anonymous. That is why the second point in the agenda of NFDW mentions the need to associate with grass roots dalit women. Further for challenging male dominance in politics dalit women are dependent on the state to create a space for them. This exposes them to the danger of co-option as was the case with their male counterparts. Nevertheless the process of empowerment of dalit women makes the terrain of nation state more contested.

Also the Indian state is keen on projecting itself as well intentioned on gender issues and has sponsored the delegation of Indian women to Beijing. The state by incorporating women's movement within the jurisdiction of its apparatus intends to domesticate the movement. Hence the crucial question which arises with regard to the NFDW is whether it will succeed in evading the trap of domestication. On the basis of available evidence it is possible to argue that dalit women can challenge the state and state-mediated dalit patriarchy. This was proved when dalit women of Bodha Gaya in Bihar who opposed the state's decision to hand over land in the names of dalit men since

it would further marginalise them. Dalit women under the Bahujan Mahila Aghadi and Shetmajuri Shetkari Shramik Aghadi in Maharashtra oppose the process of globalisation. Incidentally, the newly formed NFD women also has made clear its intention to fight the Indian state's new economic policy of privatisation and globalisation.

Dalit women, particularly at the grassroots level in Maharashtra, are exhibiting a spontaneous and strong solidarity across caste

and region against the violence let loose by the Hindutva forces. Dalit women are participating in the ongoing struggle regarding pasture land. In this context, the anti-Hindutva campaign organised by Women's Voice of Bangalore, which is a major component of NFDW, deserves mention. Thus, dalit women's perception while critical of the homogenisation of a dominant discourse, does not make a fetish of its own reality, and therefore, prevents the ghettoisation of dalithood.

LDF's Repeat Performance

Kerala's Local Body Elections

M R Biju

In spite of its pro backward class stance on the issue of reservations, the UDF failed to win majority of local bodies due to infighting and emergence of divisions within the state's Muslim constituency.

THE electoral politics in Kerala has always been a topic of special interest for political scientists all over the globe. This is the fifth time since independence that polls to the local bodies in Kerala have been held. The first poll was in 1953 under the provisions of the then Travancore Cochin Panchayat Act, 1950. The second election was held in 1964 after the formation of the state in 1956 and the passing of Kerala Panchayat Act, 1960. The third time the people of Kerala exercised their franchise was after a long break of 16 years in 1979. The fourth election to the local bodies was held in 1988.

The year 1994 witnessed the passing of two historic legislations for revamping the panchayats and municipalities in the state, following the footsteps of the 73rd and the 74th constitutional amendment acts passed by the centre. The Kerala Panchayati Raj Act, 1994 officially came into force on April 30, 1994 while the Kerala Municipalities Act came into force on May 30, 1994. On the basis of these two acts elections to the local bodies were held on 23 and 25 September 1995.

The panchayati raj and municipal polls assumed greater significance due to two reasons. Firstly, these were the first elections after vesting both the bodies with enormous powers. Secondly, it was the first comprehensive statewide electoral outing since A K Antony took over as the chief minister of the state. The ruling Congress (I)-led UDF considered the poll as a means to vindicate their claim that it continues to enjoy the overwhelming support in the state where is the CPM-led LDF considered the poll as a chance to ventilate their charges against the UDF rule.

Compared to the UDF, the selection process of the candidates for the LDF was a smooth affair. Both the fronts fielded several young faces. The candidates of both the fronts included district level leaders, ex MLAs and ex-ministers and ex MPs. The newly formed

Janathipathiya Samitakshna Samiti (JSS) extended their support to the UDF, while the Indian National League (INL) had some sort of electoral adjustment with the LDF, particularly in the northern Kerala. BJP too put up its candidates in a number of constituencies. The elections noticed an unprecedented increase in the number of independent candidates. Table 1 shows the number of candidates, fielded by major political parties.

The announcement of the poll stirred the people and political parties alike because these were the first elections after vesting with the PRIs and Nagarapalikas with enormous powers. Both the fronts resorted to street corner meetings and door-to-door canvassing in preference to public meetings. Due to the strict restrictions of the election commission on expenses, mass rallies and the use of electronic media were in a low profile.

Elections were held in two phases. In the first phase over 70 per cent voters in Thiruvananthapuram, Pathanamthitta, Idukki, Ernakulam, Palakkad, Kasargod and Kozhikode districts exercised their franchise, on September 23, 1995. The remaining districts of Malappuram, Kollam, Wayanadu, Alappuzha, Kannur, Kottayam and Trissur went to the poll on September 25. In this phase 72.75 per cent voters exercised their right to vote. Table 2 clearly illustrates the details of the districtwise polling percentage.

ELECTORAL RESULTS

Just like the first district council poll in 1991, the people's verdict was in favour of the LDF. The CPI (M)-led LDF registered victory in 530 out of the 990 gram panchayats (53.53 per cent of the GPs). The LDF captured power in 90 out of 152 block panchayats (59.21 per cent). Further, the LDF routed the UDF in the elections to the district panchayats by winning 10 out of 14 DPs (71.42 per cent). The district panchayats which went to the LDF way are Thiruvananthapuram, Kollam, Ernakulam, Alappuzha, Kottayam, Idukki, Trissur, Palakkad, Kozhikode and Kannur. Moreover, the LDF established its dominance over the urban voters by capturing 29 out of 54 municipalities (53.70 per cent) and two out of the three city corporations.

The electoral statistics reveal that the ruling UDF could establish its dominance in 342 grama panchayats (34.54 per cent) and 45 block panchayats (29.6 per cent). It could win only 3 of the 14 district panchayats and 18 of the 54 municipalities. The district

panchayats which went the UDF way are Pathanamthitta, Malappuram and Wayanadu. The UDF could not establish a clear majority even in single city corporations.

The BJP got an absolute majority in three grama panchayats – all in Kasargod. Yet, in 115 grama panchayats the voters have not given a clear verdict and things will be decided by the independents. Tables 3-8 illustrate the verdict and partywise performance.

Source: Malayala Manorama, October 1, 1995.

In spite of winning majority of the local bodies the results however do not show a wave in favour of the LDF unlike in the 1991 district council polls. But the UDF no doubt has much cause for concern. That its leaders are drawing satisfaction from the not so bad verdict shows to what level the party has sunk from the heady days of 1991 when it swept to power in the state with a powerful mandate. One of the wishful thoughts in the UDF camp was that since the front had adopted a stance in favour of the creamy layer section of the backward communities, the step would endear it to the voters of backward communities. Such ambitions were specially focused on the Ezhavas usually seen as the traditional vote bank of the CPM and its allies. But the results belied these hopes as the LDF returned triumphant where the Ezhavas have a dominant presence.

Districtwise poll analysis shows that the LDF got more than 3.75 lakh votes than the UDF. In the district panchayats out of 298 divisions the LDF got 171 (57.38 per cent) whereas the UDF captured 123 divisions (41.27 per cent). In the last civic poll held in 1988, the UDF had won 455 panchayats and the LDF 469. This time the figure is 342 and 530 respectively. In 1988 polls for municipalities the LDF had absolute majority in 15 but now it has secured 29 municipalities.

But a noticeable contradiction of these polls is that though the LDF has won more seats than the UDF, the latter has secured more votes than the former. For instance, in Kottayam district panchayat the LDF winning 11 of the 21 divisions, came to power. But the UDF has got 27,511 votes more than the LDF. Similarly in Alappuzha the LDF got 12 of the 21 seats but got 20,305 votes less than the UDF.

In Kasargod the story reverses. Here the UDF which got 11,150 votes less than the LDF is in power. The UDF got 9,851 and 25,416 votes more than the LDF in Wayanadu and Pathanamthitta respectively. In Malappuram district the LDF lagged behind the UDF by more than one lakh votes. But the LDF established a clear lead in six district panchayats. The margin of victory for the LDF over the UDF in Kannur was 1,14,000; in Trissur it was 63,842; in Thiruvananthapuram 75,429; in Kollam 97,811; in Palakkad 63,842; and in Kozhikode 93,392.

As far as the performance of other parties is concerned it is quite difficult to reach a reasonable conclusion. All these parties concentrated their attention on grama panchayats and block panchayats rather than on district panchayats.

Though the BJP has increased its strength in Kozhikode area, in Kasargod, Palakkad and even in Thiruvananthapuram, it could not muster enough strength. The party won 76,000 votes in Kasargod, 46,000 in Kannur, 1,00,000 in Kozhikode, 66,000 in Malappuram, 75,000 in Palakkad, 87,000 in Trissur, 47,000 in Pathanamthitta, 45,000 in Alappuzha, 94,000 in Kollam and 94,000 in

Thiruvananthapuram. Altogether the BJP candidate won 7.5 lakh votes all over the state.

The People's Democratic Party (PDP) was formed by Abdul Nassar Madani in 1993, after a fundamentalist organisation Islamic Sevak Sangh (ISS) led by him was banned. PDP bagged 33,000 votes in Kollam, 45,000 in Malappuram and 20,000 in Palakkad. It shows that the PDP has emerged as a strong contender to the IUMI. The IUMI is certainly the worst sufferer in the poll as it got a dribbling even in its traditional areas. Both the PDP and the INL of Ibrahim Sulaiman Sait played a key role in it. Lastly, the ISS, a new party formed by K.R. Gowri Amma could not make much impact even in her home district Alappuzha.

Though the overall performance of the ruling UDF in the poll may not add up to a rout, it certainly amounts to a setback. But compared to the 1991 elections to the erstwhile district councils the UDF has shown a better performance by capturing three district level bodies in addition to Malappuram. The UDF leaders are in a way right when they point out that the CPM's success in the Muslim League bastions in the north was made possible by its open electoral understanding with the INL led by Sulaiman Sait. Yet it is equally true that a large number of Hindus who used to vote for the BJP in the past voted for the CPM this time. Moreover, the forward caste people who used to vote for the Congress or the BJP this time either chose not to vote or voted for the left. This could be mainly due to the CPM stance in support of the exclusion of

creamy layer among the backward classes from the reservation benefits.

The INL, a splinter group of the UDF, IUMI, and the PDP led by Abdul Nassar Madani did bag a lot of votes that would have otherwise gone to the UDF. Even where the candidates of these parties lost, they indirectly helped the LDF candidates.

The poor performance of the UDF in some of the Syrian Christian dominated areas in Ernakulam and Kottayam districts also indicates a small but perceptible shift in their political allegiance, though it need not be merely on account of the reservation issue. The UDF calculation that its pro-backward class sloganeering might help it to consolidate Muslim votes and win over the Ezhavas to its fold did not succeed. The Madani led PDP equally cut into both CPM and IUMI vote banks in the central and southern districts and the LDF did not lose the Ezhava votes.

Voters in the smaller towns of the central and southern districts have not rallied in support of the left on such a scale ever since the ousting of the Namboodiripad ministry. Nevertheless, the UDF could have registered a better performance had its house been in order. The Congress rebels played havoc with the ruling front's fortunes in a number of constituencies. The two factions of the Kerala Congress led by K.M. Mani and T.M. Jacob fought against each other to the advantage of the CPM in Kottayam and Idukki districts. Lastly, though the IUMI has managed to retain the Malappuram district panchayats, its urban base has been severely eroded and there is little to suggest that the threat from its rival formations has receded.

Tanzania on Election-Eve

People Want Change

Amrit Wilson

With polling day close at hand, Tanzania is witnessing the remarkable phenomenon of the emergence, almost overnight, of an opposition party which has mass popular support and has been holding rallies the like of which have not been seen since the days of the anti-colonial struggle

TANZANIA is gripped by election fever. It is the first multi party election since 1962, and Dar es Salaam, its capital, is responding in its own peculiar and varied ways.

At the British Legion, a plush club in the heart of town, they are telling jokes about Tanzania's international debt and how Nyerere got the Pope to intercede with God. God, the Pope asked, when will priests marry? Not in your lifetime, came the answer from above. God when will women become priests? not in your life time, said God, then the Pope popped the real question: When will Tanzania get out of debt? there was a pause then God answered: not in my life time. The table full of well dressed male civil servants and the odd lecturer or two from the University of Dar es Salaam roar with laughter. But today there is a distinct unease, because despite the jokes and civilised cynicism, almost all of these men are supporters of the ruling party, the Chama Cha Mapinduzi (CCM), set up by Nyerere in 1977. And the CCM is in deep trouble, challenged by a new opposition party, the National Convention for Construction and Reform (NCCR). Mageuzi (NCCR). Mageuzi means transformation in Kiswahili.

On the streets outside in a minority of areas the green flags of CCM vie with the blue of NCCR Mageuzi, but mostly the green has been swept away in a tide of blue. In the markets and kiosks selling mainly second hand or substandard goods from France, the traders and the large numbers of unemployed youth are outspoken - they want a change of government. They want jobs and basic services. They are tired of the corruption of their leaders. They tell you that the hospitals have no equipment and few medicines, women giving birth have to provide their own gloves for the delivery. Injured people should bring their own needles, in case stitches are required. One young man comments bitterly, that is the policy of the CCM, that is what they mean by 'the people must be self-reliant'.

In fact Tanzania is now the second poorest country in the world, next to Mozambique. According to the 1995 World Bank *World Development Report*, the GNP per capita is \$30 dollars, half of that of neighbouring

Uganda which has experienced far more strife in the last 20 years.

So how did this come about? Tanzania was once a comparatively well off African country. In 1965, for example, one year after the union of Tanganyika and Zanzibar into Tanzania, there was 7 per cent agricultural growth (mainly in cash crops), industrial production (mainly textiles, meat canning and beer and soft drinks) was getting going, villages were thriving and people were enthusiastic enough to build 10 000 km of road in a voluntary nation building programme.

Ironically things began to go badly wrong in the wake of Nyerere's attempt to impose socialism - through the Arusha Declaration. Unfortunately this African socialism as he called it, turned out not to be socialism at all but a kind of welfarism based on foreign aid. After this, Tanzania's first five year plan was abandoned along with all attempts to develop the productive forces. Whereas socialist policies would have required productive forces to be developed with the modernising of agriculture, the development of new industries and new lines of production, what actually happened was that peasant production was left as it was and merely reproduced itself. At the same time three new policies were set in motion. Firstly, free welfare services were established based mainly on foreign aid; secondly, there was planned nationalisation of key industries which would help develop other industries, for example textiles which would develop cotton growing, and meat packing which would develop dairy farming; thirdly, there was a villagisation programme in which people were encouraged to move into new 'villages' where social services would be available to them. The early years of this policy brought slow but steady development of the economy. But by 1972, Nyerere grew impatient. He drastically reshuffled his cabinet and took power into his own hands. People were driven out of their villages by the army, dumped in the bush and ordered to set up new villages from scratch. This meant that with the existing villages wiped out and the new villages unable to begin production, there was no agricultural production. It resulted in the famine of 1974.

At the same time Nyerere decided to nationalise the wholesale trade. In Tanzania most trade had been based on families, mainly Asian families. They would import consumer goods, clothes, groceries and other essentials which were not locally produced, using their own capital and expertise, distribute it on their own transport system to their own networks - often extended family members. When this was nationalised the entire trading system collapsed. The government did not have either the capital or the expertise to import enough goods, it had no transport system to supply all the distant parts of the country and no distributive network. This led to a disastrous shortage of food and commodities. The economy went into a downward spiral and poverty began to intensify. The remedy for this was seen as foreign aid.

By this time, because of the oil crisis and the domination of petrodollars, borrowing had become easier. Tanzania began to borrow indiscriminately, firstly from the World Bank, whose then governor, Robert McNamara, a long term admirer of Nyerere, poured in money to set up essentially neo-colonial, export oriented village schemes for the production of cash crops, and also from international financial markets, western governments and so on. The result was the emergence of corrupt debt fixers - the proverbial Mr Ten Per Cent. The Tanzanian economy sank deeper into debt. Borrowed money did not go into production to pay off debts but was consumed by this parasitic group. White elephants abounded like the ultra modern airport at Dar es Salaam, built at a cost of 120 million dollars from France to replace the more modest but adequate existing airport.

With the advent of the Reagan era, the IMF and World Bank started cutting back on loans and urged Tanzania to implement structural adjustment policies. Nyerere tried to resist these but was hardly in a position to do so, because by now industrial production was down to a third of capacity. The Tanzanian shilling was devalued and while Nyerere resisted, the IMF pressurised all western countries including Scandinavian countries to stop giving aid to Tanzania.

If things had been bad in mainland Tanzania, on the island of Zanzibar they were even worse. Once a dynamic and thriving centre of trade, Zanzibar had been ruled by a puppet Sultan as a British protectorate till 1964 when the Sultan was overthrown by a popular uprising spearheaded by lumpen youth. This uprising was partially transformed into a social revolution by the radical left wing Umma Party led by Abdul Rahman Babu. But the government which took over was a mixture of political forces with Babu as foreign minister and Abeid Karume of the right-wing Afro-Shirazi Party as president.

The US, afraid that Zanzibar might turn out to be the Cuba of Africa from where communist revolution would spread to the rest of the continent saw Tanganyika under Nyerere as a more easily controllable and 'stable' country which would neutralise these influences. The CIA under Frank Carlucci, later deputy director of the CIA, got to work and within three months of the overthrow of the Sultan Zanzibar and Tanganyika had been united to form Tanzania. Babu was transferred to mainland Tanzania as a cabinet minister while Karume subjected Zanzibar to a cruelly authoritarian government locking up, torturing and killing political opponents while the economy deteriorated. Eventually in 1972 Karume was assassinated in a revenge attack by a man whose father had been killed by the regime. Karume's murder was used as an excuse to arrest Babu and other Umma Party activists who were locked up for six years without trial – many being tortured brutally. Eventually after an international campaign they were released. Meanwhile the Zanzibar economy all but collapsed and by the 1980s there were increasingly loud demands for Zanzibar autonomy.

Faced with these multiple problems – the collapsing economy, mass discontent in the mainland and Zanzibar, the international debts mounting to impossible levels – Nyerere resigned gracefully, leaving Ali Hassan Mwinyi, the strikingly uncharismatic and comparatively inexperienced Zanzibar vice-president of Tanzania to take over. Mwinyi totally surrendered to the IMF and World Bank. At the same time he capitulated to the corrupt but increasingly powerful politicians who had emerged in the heyday of foreign aid. For example, the 'leadership code' one of Nyerere's ideological creations, under which government servants and political leaders could have only one salary was abolished. Politicians can now do business. At the same time the village social structure became increasingly distorted. In the 1970s, every 10 houses in a village had a leader and every ward (kata) had a secretary or katibu. These leaders and particularly the katibukatas began to extort money and gradually emerged as fully fledged tyrants.

At the same time the level of violence against women, in and outside the home escalated – not only in the villages but in towns and even in Dar es Salaam University where rape began to be seen by male students and lecturers as something quite normal.

Meanwhile the winds of the new world order were sweeping Africa. With the decline of the Soviet Union the US began to see the maintenance of unpopular client regimes as unnecessary because after all popular resentment and uprisings hardly provide a stable climate for investment. Under pressure from the IMF and World Bank, and demands from their own people one African country after another held multi-party elections.

Finally in 1992, the CCM announced that Tanzania would do the same.

Now with polling day (October 29) close at hand, Tanzania is witnessing another remarkable phenomenon – the emergence almost overnight of an opposition party (the NCCR Mageuzi) which has mass popular support and has been holding rallies the like of which have not been seen since the days of the anti-colonial struggle.

Formed in 1992 by a group of human rights lawyers who had distinguished themselves by fighting for the rights of the Barotse people whose land was being taken over by a Canadian funded wheat farm, the NCCR is still in the process of evolution. In March this year it was joined by Augustine Mrema who had been home minister in the CCM cabinet. A charismatic speaker, Mrema had been one of the most popular ministers partly because he had consistently spoken out against corruption and some say that it was this that cost him his job in the cabinet. He was also unique amongst Tanzanian leaders in taking a position on domestic violence and urging women to report their violent partners to him. When he left the government his popularity increased; he was seen as someone who with the best of intentions had been unable to work within the CCM. As the editorial of *The Express* one of Tanzania's few independent English language newspapers, commented at the time: "Mrema's problem was that he believed he could best serve the country by working through the cabinet – as such he is one among very few Tanzanians who has tested out the theory to his chagrin". In September this year with Mrema's populist message about fighting corruption, police brutality and youth unemployment already pulling huge crowds, NCCR was also joined by Abdul Rahman Babu – returning to politics after an absence of 16 years. Always hugely popular, Babu was greeted with an overwhelming welcome from the masses. Not only was Dar es Salaam airport packed but despite heavy rain, thousands of people poured out on to the streets all along the route shouting slogans such as 'Babu is back and Nyerere is scared', 'They are frightened of him, they are frightened of him'.

Since then NCCR has formed an alliance with another smaller opposition party Chadema and many CCM stalwarts have defected to join it. Far more striking however is the level of popular excitement. In villages, peasants have mobbed the NCCR team complaining bitterly about the katibukata and looking forward to the day when it will be 'bye bye CCM'. Unemployed youth tear off their shirts and wipe the Mrema-Babu team's car as a gesture of appreciation, old people bless them and want to touch them, and young people shout 'We want jobs, liberate us from poverty'. In contrast the CCM campaign has aroused embarrassingly

little enthusiasm. The presidential campaign is led by Ben Mkapa, a journalist who edited the CCM party paper and then the government-sponsored *Daily News*, and is now minister of science and technology.

The elections themselves are funded by western governments and monitored by a host of foreign observers but how free and fair they will be is still an open question because CCM not only controls the press and state apparatus but also the judiciary and the election commission. The effects of this can be drastic as was shown by the farcical events surrounding Babu's candidature. Initially put forward by NCCR as Mrema's vice-presidential running mate, Babu was ruled unfit to run by the election commission because they alleged he had been sentenced to death 23 years ago. NCCR tried to challenge the decision in court, armed with an affidavit from Wolfgang Dorado, the prosecutor in 1972 case declaring that Babu had never been charged, much less found guilty. However when the election commission asked for more time to research the case, the court delayed judgment, robbing the NCCR of valuable campaigning time. Babu then decided to withdraw his candidature, remaining however an active campaigner on the NCCR team. As for the masses of peasants and unemployed workers it does not seem to have made any significant difference. The NCCR manifesto drafted by a team chaired by Babu is continuing to produce euphoria. It promises the people among other things the individual right to own land – something Africans (but not foreigners) have been denied in all these years of independence. It also promises an end to indiscriminate privatisation and a more internally integrated economy with production geared to creating an internal market and meeting essential internal needs.

Meanwhile in Zanzibar, the outlook for CCM seems equally bleak, a Zanzibar nationalist party the Civic United Front (CUF), seems poised to win the election. Their policies, beyond opposition to the CCM, are not widely publicised but the party leader, Seif Sharif Hamad has links with Oman and the Gulf and the presidential candidate Ibrahim Lepumba is said to be a committed supporter of IMF policies. Whatever CUF stands for, and irrespective of whether it wins, one thing is clear: Zanzibar is heading inexorably towards greater autonomy.

The presidential race is now between four candidates representing CCM, NCCR, CUF and the much smaller United Democratic Party (UDP). Currently, Nyerere, the 'Father of the Nation' is limbering up to begin the last stage of campaigning supporting the desperate Mkapa. If the NCCR wins despite this, it will be the end of an era – the beginning for Tanzanians of a conscious struggle against neo-colonialism.

Structural Changes and Tax Reforms

Mahesh C Purohit

Economic Policy and Tax Reform in India edited by K Puttaswamaiah; Indus Publishing Company, New Delhi, 1994; pp 237. Rs 300.

THE last two decades have witnessed restructuring of tax systems in most developed and developing countries. The revolutionary changes attempted include broadening of the tax base, reducing the number of rates, curtailing tax incentives, bringing down the import tariff and introducing value added tax to replace internal commodity taxes. More importantly, there has been a change in the traditional goals of tax policy.

India has followed the path of planned economic development. Its tax policy was assigned the goals of accelerating growth with social justice based on a socialist pattern of society. Within the framework of mixed economy, tax policy was aimed at fulfilling the following goals:

- (a) to help accelerate the rate of savings and investment;
- (b) to mobilise resources through budgetary surplus and surpluses of public enterprises;
- (c) to direct investments into most desirable channels according to plan priorities;
- (d) to reduce economic inequalities; and
- (e) to contain inflationary tendencies.

With the structural adjustment programme leading to changes in economic policy the existing goals relating to equity and social justice have been replaced by the objectives of neutrality and efficiency. Evasion and consequential parallel economy have been given increasing importance and redistributive aspects have been given a low profile. The latter aspect has of late been assigned primarily to expenditure policy.

In the context of the changing economic policy and the concomitant tax reform, *Economic Policy and Tax Reform* edited by K Puttaswamaiah is a timely and useful contribution highlighting some of the important aspects. It contains six papers and a Foreword by M S Swaminathan, all of which are related to the economic policy and tax reforms.

One of the papers is on 'Tax Reform in India'. It is a joint study of Robin Burgess of the London School of Economics and Nicholas Stern of the European Bank for Reconstruction and Development. Both the authors were at the Suntory-Toyota International Centre for Economics and Related Disciplines, London School of Economics, when the study was conducted. The study traces the evolution of the tax structure in India since independence and

provides insight into the way the structure has evolved over time. It presents a comparative analysis of the tax-GDP ratio with other countries. An important conclusion emerging from the comparative analysis suggests that the tax-GDP ratio for India is comparable to that of other developing countries. Initially, in 1950-51 the tax ratio in India was 6.7 per cent of GDP. However, it increased 16.2 per cent in 1988-89. As compared to this, the average ratio for the developing countries at present is 14 per cent of GDP. Also, the authors give cognisance to the fact that the tax structure is influenced by the federal polity of the country.

There are two other important features of the study by Burgess and Stern. First, it traces evolution of the tax system with the help of all the available important research papers/studies as also the official documents (reports of government committees/commissions). Secondly, the evolution of the tax system is backed by an excellent data base on tax revenue of the centre and the state governments. It suggests various policy imperatives related to reducing the fiscal deficit and recommends further areas of research.

Two of the studies in the volume relate to public debt. The paper by N S Bhat on 'Development Expenditure and Public Debt in India: An Empirical Analysis' examines the application of the Wagner's Law. It tests the hypothesis that increase in public expenditure raises public debt in India. The results of the regression analysis covering a period of 15 years (i.e. 1969-70 to 1985-86) support the hypothesis. The study suggests ways and means to reduce public debt for the posterity. The author prescribes that the government should reduce its developmental role to give way to the private sector. Another study on 'Debt-Tax Ratio and Government Spending: What Causes What?' by K Sham Bhat and V Nirmala examines the issues related to debt and economic activity. Covering the period of 1955-1990 and employing Granger and Sims tests the paper supports the hypothesis that an increase in public expenditure enhances the debt-tax ratio.

Regional aspects of the changing economic policy have been analysed in a paper on 'Regional Economic Change and Development Policy in India' by Ashok Mathur. It concentrates on analysing the

trends in inter-state disparity, examining the aspects of output, employment and structural changes in regions, and estimating spatial equity in the context of the economic policy. The paper highlights some of the key infrastructural variables and the trends of devolution of resources from the centre. Also, it aims at giving suggestions for bridging the gap in the levels of development between different regions.

P R Brahmananda stresses the need for recasting the development and planning profile in his paper 'Towards a New Adjustment and Reform Rationale'. He strongly argues for high savings, wage goods, productivity-based foundation. The paper also explains various facets of Indian economic planning and presents an examination of the structural adjustment process. In addition, it presents implications of full convertibility and other financial reforms. It goes on to giving its future perspectives on the contours of the new economic policy.

A topic unrelated to the title of the book is presented through a paper by D Varatharajan and K K Saxena on 'Consumption Behaviour and Demand Projection'. It analyses the consumption and demand behaviour for fertilisers using Tobin's model.

The volume is a timely contribution covering a large area of the new economic policy. It would, however, have augmented the usefulness of the book if the editor had provided readers with an Introduction enlightening them about the contents, coverage and the relevance of the book.

Since there are various facets to tax reform and economic policy, any collection of papers may not have a complete coverage. However, the author has done a good job in bringing many useful papers of diverse aspects together. One, however, wonders whether it would have been useful if the editor had avoided the restricted selection. At least some more papers covering broad areas of structural adjustment programmes in relation to the new economic policy as well as tax reform could have been included. The restricted choice of the editor to papers from the *Indian Journal of Applied Economics* has diminished the importance of the volume. It would have added to the usefulness of the work if some other papers were also included to have complete coverage.

In regard to tax reform, it would have been useful to point out that in the context of the new economic policy some of the reforms are not in the requisite direction and various other reforms are still needed. Some of the aspects have been touched upon by Brahmananda but there are various areas where a lot has to be done. There is a need

to rationalise the capital gains tax and the corporate tax in the country. Presumptive taxation is required to be extended and strengthened. The taxes have to be geared to help us have environmental-friendly production system through proper pricing of utilities or a carbon tax (or tradable permits).

In the context of new economic policy some rethinking is definitely necessary in regard to custom duties. A rational tariff policy for India may be to reduce custom duties gradually. Also, it is essential to have adequate anti-dumping legislation such as those pursued in the US.² It is also important to emphasise that the development strategy is based on the domestic savings to avoid the Mexican type crisis.

Interestingly, a recent paper by Robin Burgess and Nicholas Stern with Howes could be useful additional reading which recommends further policy prescriptions for reform of commodity taxes to introduce value added tax.³

However, to have a balance, it would have been necessary to replace some of the existing papers. The papers on fertiliser market and regional economic development, although useful, do not seem to connote direct relevance to the subject of the volume. These could have fruitfully been replaced to give place to some directly related papers.

Notes

- 1 There are some good papers on public debt having macro perspective and long-range view. See in particular R J Chelliah, 'Growth of Indian Public Debt' in Bimal Jalan (ed), *Indian Economy: Problems and Prospects*, Viking, 1992.
- 2 See Mahesh C Purohit, 'An Analysis of the Recent Tax Reforms in India', *Asia Pacific Tax Bulletin*, Amsterdam, July 1995, pp 196-203.
- 3 The paper is included in an edited volume. See Mahesh C Purohit and Vishnu Kanta Purohit (eds), *Commodity Taxes in India: Directions for Reform*, Gayatri Publications, Delhi, 1995.

Anarchic Politics in Jammu and Kashmir

Gopal Singh

Jammu and Kashmir at the Political Crossroads by P S Verma; Vikas Publishing House, New Delhi, 1994; pp 296. Rs 350.

SINCE the beginning of militancy, terrorism and state terrorism in late 1980s, particularly after the resignation of Farooq Abdullah as the chief minister in protest against appointment of a governor, there has been virtually a flood of literature on the crisis in Kashmir in terms of books, research papers, and newspaper articles. However, quite a large number of these works are stereotypical in the sense that these are generally based on secondary sources and the vision and perception of authors seem to be vitiated by the mass media and propaganda blitz of government of India (GOI) or for that matter of Pakistan.

P S Verma's book is in stark contrast to this general monotonous trend. It is refreshing and enlightening. The author has strived to be as objective as possible. Verma's book bears the stamp of originality and authenticity because he has conducted field study in three regions of the state, has interacted with a large number of people and politicians of different shades, and, above all, has consulted original documents rather than relying on secondary sources for the purpose of understanding and analysing the problem. However, the book also suffers from weaknesses, both major and minor in nature, about which I shall talk towards the end of this piece.

I

To begin with, I would like to highlight three basic achievements of the author which happen to be a net contribution to the existing literature – first is his understanding of the genesis and growth of militancy, terrorism and state terrorism, particularly what he calls the "internal-external dimension" and the related question of violation of human rights; the second is his analysis of all the assembly elections held in the state after signing of the instrument of accession and the third is tracing the history and consequent political developments in Jammu and Kashmir from medieval times, till the beginning of 1990s. These are the three important threads which are interwoven throughout the book, at times implicit, at times explicit.

MILITANCY

Militancy, terrorism, state terrorism and the question of human rights form the dominant mode of Verma's discourse. He constructs the theme with great pains (pp 203-96). The author makes a significant observation, "The collapse of civil society has thus surfaced in a big way.. As a consequence of the current crisis, all political parties... have become dormant in the valley. Many of their leaders have fled the valley or announced retirement or dissociation from

politics and some of them have taken a pro militant stand" (p 260). Going a step further I would say that as of today, all socio-political processes have come to a grinding halt. Verma has discussed in detail the genesis and growth of militant violence and its internal-external dimensions thereof. Whereas the local conditions prepared the ground, the ISI of Pakistan took charge of financing, training and sheltering the militants of all groups ranging from JKI to Jamat-e-Islami. The TOPAC plan allegedly masterminded by Zia ul-Haq in mid-1980s to create conditions of chaos and anarchy in Kashmir leading to ultimate annexation of the territory to Pakistan has been discussed in detail. The nature and ideology of different militant organisations – most of which are pro-Pakistan (JKI being an exception) – and their umbrella body, All Party Hurriyat Conference (APH) have also been discussed.

While preparing the profile of militant leadership, as also of the cadre, the author has brought out two broad differences between Kashmir and Punjab militancy. Firstly, the Kashmiri militants by and large are highly educated, most of them being graduates which is not the case with the Punjab militants. Secondly, most of Kashmir militants belong to urban areas as against the rural background of most of the Punjab militants. But Verma does not say a word about mercenaries, their SES, particularly Afghans and Pakistanis who are presently operating in Jammu and Kashmir, controlling and co-ordinating the activities of local militant organisations.

However, there are couple of points which the author should have highlighted: (1) terrorism and state terrorism are mutual reinforcing phenomenon, one feeding the other and the main casualties of which are generally the lives of innocent people, the property and their human rights above all; (2) militant violence and state terrorism are the consequences of the politics and economy of the ruling classes, both at the centre and in the state. Add to it another bitter truth that a disturbed Jammu and Kashmir always serves the vested interests of the ruling class of both India and Pakistan. It is the easiest tool in their hands to divert the attention of the people from their basic problems, sabotage the mass democratic movement for better life, and above all to perpetuate their exploitative rule. If the crisis within one or both the countries deepens where their rule is threatened, a small war is ruled out. After all, India and Pakistan have fought three wars in less than 50 years.

The author is highly critical of Human Rights Organisations (HROs) particularly of London based Amnesty International (AI) and US based Human Rights Watch (HRWA). He laments that these HROs are politicised and give biased reports. For

instance, the atrocities committed on militants and others by para-military forces are given prominent coverage whereas atrocities committed by the militants on innocent people are not even mentioned. Two points need to be mentioned with regard to this. Firstly, India's official National Human Rights Organisation (NHRO) gives one-sided version of violation of human rights by militants whereas non-governmental organisations focus on the acts of omission and commission by para-military forces and the police-bureaucracy nexus. But it is heartening to note that the Brussels based International Relations and Human Rights Research Centre (IRHRCC) has given a fairly balanced report. Its representative Claire Galez spent six months in 1994 visiting Kashmir on both sides of Line of Control (LoC). He has given adequate space to human rights abuse in Pak-occupied Kashmir (PoK) as well as in Indian Kashmir. However, PoK is beyond the purview of Verma's book. Perhaps for him, like the GOI, the PoK is an integral part of India on paper only.

ELECTIONS

Verma, a psephologist of international fame, has conducted election studies in almost all the four north-western states – Punjab, Haryana, Himachal Pradesh and Jammu and Kashmir. Naturally, the second and third chapters entitled, 'Electoral Politics: 1951-1989' and 'Political Leadership: A Profile of the Legislative Elites and Party Leaders' are the best chapters. Verma traces the origins of militancy in Jammu and Kashmir in electoral malpractices and rampant corruption in leadership and bureaucracy. In the third chapter, the author has taken great pains in reproducing all possible data regarding elections (1951-89) and analysing the performance of the parties. The author has explained the minutest details of electoral malpractices such as rigging, unopposed elections, corruption, use of money power, the unholy and opportunistic electoral alliances.

Verma is of the view that elections in Jammu and Kashmir, (except that of 1977) have been rigged. Elections by and large have not been 'fair and free'. Indira Gandhi-Sheikh Abdullah accord was followed by 1977 assembly elections when Morarji Desai was heading the Janata party government at the centre. In spite of Sheikh Abdullah's illness, who could not canvass for his newly revived National Conference, his party got 47 out of 76 seats with 46.2 per cent of popular votes. However, the 1987 assembly elections which were held after signing of the Rajiv-Farooq accord, played a catalytic role. There was mass scale rigging and the main opposition party Muslim United Front (MUF) felt cheated and betrayed. The faith of party supporters in the 'ballot' was badly shaken and when rigging was repeated in

1989 parliamentary polls, some organisations started using 'bullets'. Besides many other causes, this perhaps was the most important cause of the emergence of militancy.

In the same chapter, the author gives a profile of political leadership based on information collected by him through personal interviews (and other sources) with various MLAs, MPs and other important leaders belonging to different political parties.

HISTORY

In the first chapter, Verma focuses on the composite culture of Kashmir, popularly known as 'Kashmiriyat' a product of sufi saints and their preachings of universal brotherhood, equality and justice. The dynamic interaction of all religious faiths, particularly Islam, Hinduism, Buddhism and Christianity, has been analysed.

It is the politics of post-independent India which slowly but surely destroyed the composite culture. The author basically holds Hindu chauvinism and Muslim fundamentalism responsible for it. In the pre-partition and partition days when the plains were afire with communal flames, there was complete harmony in Kashmir. The author rightly gives credit to Sheikh Abdullah for maintaining peace. But the attack of the raiders supported by Pakistan's regular forces, signing of the instrument of accession and the unilateral and incomprehensible declaration of cease fire by the Indian government leading to vivisection of the state and creating an artificial line of control set the stage for what we are seeing today. Sheikh Abdullah's arrest in the early 1950s and his imprisonment for more than two decades with brief but strange interludes, sealed the fate of composite culture and communal harmony. I agree with the author that by now the process of cleansing of ethnic groups, purely in terms of religion, not in terms of language and culture, is complete. The Kashmiri pandits have left the valley either out of choice or because of fear and terror. So the valley is almost 100 per cent comprised of Muslims. Jammu, Udhampur, Kuthua are preponderantly Hindu whereas Leh is Buddhist, and Kargil being Muslim. There are serious differences bordering on hostility between the three regions of the state – the Kashmir valley, the Jammu area and Leh-Ladakh. The worst sufferers however are the Kashmiri pandits who have left their homes in the valley and are living in inhuman, miserable conditions in refugee camps in Jammu, Chandigarh, Delhi, etc. Yet, the constant conflict of interests between the three regions contributes to the emergence and sustenance of militancy. Does this mean the end of politics in the state? Is anarchy responsible for it? Or is it politics which is responsible for anarchy?

To me, it appears that anarchy in Jammu and Kashmir on both sides of LoC is an outcome of vicious politics of India and Pakistan. The anarchy is much more visible in the Indian part of Kashmir because of the 'proxy war' unleashed by Pakistan's powerful ISI through massive infiltration of foreign mercenaries in the name of 'Jihad' and through local Kashmiri youth for 'azaadi'. The question which often arises in my mind is as to whose 'azaadi' Pakistan wants, for whom, from whom and for what purpose? How much 'azaadi' Pakistan has given to the people of so-called 'azaadi Kashmir' (PoK)? Or for that matter how much 'azaadi' Pakistan's federal government has given to the Mohajirs in Karachi, Hyderabad and Sukur in Sindh? A very pertinent question to be raised is: how peace and normalcy can be restored in Jammu and Kashmir? Given the gun battles between the Indian forces and Pakistan-backed militants, the bombings and kidnappings, not only of local dissenters denounced as traitors but also of the foreign tourists, a forced, fake, forged, fictitious and rigged elections will surely further deteriorate and worsen the situation. What is the way out? What can be 'done to recreate' the civil society out of the wreckage of the 'jungle raj'?

II

Verma has thrown fresh light on available information and adds his own both in terms of explanation and analysis of the crisis. Yet one discerns glaring, and at times startling and serious, lapses and weaknesses, both technical and substantial in nature.

Methodological shortcomings, which otherwise can be ignored in a monumental work of this type, are really irritating, to say the least. The book begins with geography, history, society, etc. These details could have been given in the second chapter. The author has not made any effort to locate the problem nor has he talked about various perspectives, including his own, to analyse the problem. There is hardly a word about methodology. Fact is that almost every south Asian state is facing problems, Pakistan in form of Mohajir Qaumi Movement and Sri Lanka in form of LTTE. How is the problem in Jammu and Kashmir different from or similar to the problems other states are facing? An introductory chapter identifying the problem and specifying the available perspectives, or at least elaborating his own perspective, would have added to the academic content of the book.

Verma is seriously concerned with the miseries of the innocent Kashmiris who are bearing the brunt of militancy, terrorism and state terrorism for no fault of their own. But he falters towards the far end of the book when he floats some suggestions in form of conclusions as solution to the complex problem. And this is the major weakness of

the book. He makes the oft-repeated suggestion that the process of development be accelerated to eliminate poverty and unemployment, particularly among the youth, and that the "minds and hearts of the people of Jammu and Kashmir should be won over." These suggestions in today's context, in my opinion, have no relevance. However, two of his suggestions merit serious consideration. One is, "sincere efforts should be made to persuade all groups and sections of people, including the youth in revolt, and bring them to the negotiating table" (p 287). This is a worthwhile idea because violence, or for that matter war, does not solve any problem. But given the active involvement of Pakistan and her obdurance and obstinacy, negotiations cannot be held either with the militants or with Pakistan, even under the clauses of Shimla agreement, because Pakistan is not interested in peace but in 'proxy war' to avenge the defeat of 1971, a point which the author has repeatedly asserted and the whole world, particularly the US, knows it. Verma makes another suggestion, about which a debate has been going on for almost a decade among the academics without making any impact on the politicians. Verma says, "Grant of more internal autonomy with greater emphasis on balanced development of all the three regions along with decentralisation of politico-economic power may help the state in reviving the political process" (p 286). I would like to make two comments in this regard. Firstly, enough autonomy has been given to Jammu and Kashmir under article 370. Secondly, most of the regional political parties, particularly the Shiromani Akali Dal (SAD) in Anandpur Sahib resolution (1973), have articulated the demand for greater autonomy but it has not been accepted by the centre. What, then, does the author mean by 'more internal autonomy' to the state of Jammu and Kashmir? Is it restoration of the pre-1952 status? Verma should have elaborated the constitutional arrangement for it. Further, will such step restore peace and normalcy and revive the political process? I am quite sceptical about it because all militant organisations, invariably supported by Pakistan, want nothing less than 'azaadi', which in any case means secession from India. I am not against 'more internal autonomy' being granted to all the states and the union territories in India but the crucial question is - will it help in resolving the crisis in Jammu and Kashmir or will it further aggravate the worsening situation?

Verma also forwards an interesting advice: "keeping in view the existing crisis, the security arrangements along the border should be tightened and the state administration streamlined to become responsive to the people's problems. The people will then respond in the manner of the Sikh peasantry in Punjab during the years 1992-93 and Kashmiris will hopefully return to normal

political process" (p 287). This statement deserves two comments: one, the major mistake of Beant Singh's government was its failure to follow the restoration of peace and normalcy with amicable resolution of socio-political problems. The regional demands raised by SAD during Dharam Yudh Morcha (1982-85), the various assurances given in Rajiv-Longowal accord, and above all the factors which gave birth to militancy and sustained it for more than a decade were dumped in cold storage. Violence of the militants was dismissed as a law and order problem. What has been the result? Beant Singh was assassinated in Z-plus security zone at Chandigarh secretariat on August 31, 1995. The confidence of the people of Punjab in security arrangements was badly shaken. Very surely, this is not an isolated incident. I have been arguing all through my writings on Punjab over past decade that state terrorism is no solution to the terrorism of militants, that political problems need political solution, and I still hold this position. As for Kashmir, no security arrangements can be perfect. The governor of Jammu and Kashmir had a narrow escape in a bomb blast at Jammu and hundreds of people are dying daily. By now, it must be clear that Pakistan's powerful ISI has spread its tentacles not only in Jammu and Kashmir, Punjab and other parts of the country but also in Afghanistan where its military outfit, the Taliban, is virtually at the point of overthrowing Kabul government and the president of Afghanistan has written to the security council to restrain Pakistan from interfering in its internal affairs. So there is no hope of 'Punjab pattern' emerging in Jammu and Kashmir. In fact, the problem in Jammu and Kashmir is much more complex because of PoK and Pakistan. The author himself concedes this point and closes his discussion on a pessimistic and despondent note. "The situation as it obtains today, and as long as Pakistan remains involved in the subversive activities, does not appear to hold out prospects of a durable solution in the near future" (p 284). Does it mean that the people of Jammu and Kashmir, on both sides of LoC, are condemned to live in chaos, anarchy and bloodshed forever because Pakistan will continue its activities and India will respond the way it has been doing so far?

The book ends thus: "if the problems of rampant corruption, nepotism, unprincipled politics, inter-regional conflicts, uneven development, etc, are tackled, it will help a lot in winning the minds and hearts of the Kashmiri people" (p 287). The question is who will do it? And, nothing is further away from objective reality than this type of wishful thinking. The author himself has pointed out at many places in the book that developmental funds and subsidies given to Jammu and Kashmir were pocketed by politicians and bureaucrats, to the extent that payment for

"constructed roads" were made when these roads actually did not even exist. Scams and scandals are now a routine affair. Then, how does he defend his purely utopian formulation?

Coming to the substantial lapses, I would like to point out two uncovered areas, quite important to comprehend the dynamics of the current crisis: (i) the PoK and (ii) the LoC. In a work of this type, a chapter on PoK was essential. What is the constitutional and political status of PoK? Is it an integral part of Pakistan or is it really 'azaad' because the Pakistani government calls it 'azaad Kashmir'? What is the ethnic composition of people in different parts of PoK? Is there any provision for them like article 370 in Indian case or has it been colonised by Punjabis and Pathans? Since, most of the training centres of the militants are in PoK its study is all the more important. A chapter was essential particularly when lot of material is available on PoK. Secondly, the line of control (LoC), now called line of actual control, because of variations caused by 1964 and 1971 wars has always baffled me. The author says that the raiders were pushed back after signing of the instrument of accession and cease fire was declared at a particular geographical place. What were the compulsions of Indian government to halt the advancing forces, particularly when the commander just wanted 24 hours to clear the entire territory of raiders (of course, supported by Pakistan's regular armed forces in raiders' dress)? And why take the issue to the UN? There are many versions of this eventuality but I have found none of them convincing. Was it under the pressure of Sheikh Abdullah that Nehru did it? Was it because the Sheikh suspected loyalty of the people beyond the LoC? Or was it because Nehru feared a full-fledged war with Pakistan? A chapter on this issue could have made the work academically much more sound. The text of the instrument of accession and of Shimla agreement as appendices would have helped the reader to know what actually transpired. Some western scholars have recently challenged the authenticity of the instrument of accession and the spokesperson of Clinton administration about South Asia believes that Kashmir is a disputed territory. Recently she remarked that Al-Faran (which has kidnapped five foreign tourists, executed one and has kept the other four as hostages for more than two months) is not an outfit sponsored by any government. But the whole world - particularly the US, the UK and Germany whose nationals are hostages - knows that Al-Faran is an outfit of Harkatul-Ansar based in the capital of Pakistan.

Since the present edition of the book has already been sold out, the author will render yeoman's service if he adds to the revised edition of the book something which he finds worthwhile in my review.

Public Intervention for Poverty Alleviation

An Overview

V S Vyas
Pradeep Bhargava

Although there is a high degree of uniformity in the approach and content of poverty alleviation programmes (PAPs) in India, there is great variation across states in the outcome of these programmes. The reasons for this have been explored in a research project in which nine states were selected for in-depth study of poverty conditions and implementation of PAPs, the results of which are presented in this issue. The organisation and general findings of the project are summarised in this introductory paper.

MUCH before poverty alleviation was put on the development agenda of the developing countries and multilateral and international aid agencies, leaders of the independence movement in India had accorded it the status of one of the primary national objectives. There are various reasons for India's commitment to poverty eradication. The most important among these is the nature of the national struggle which led to independence. The mainstream political movement in India was profoundly influenced by the Gandhian approach which emphasised the need to uplift the social and economic status of the poorest of the poor, or 'antyodaya'. Emphasis on an egalitarian social order was reflected in the policy documents which were produced by the Indian National Congress. Most notable among these was the report of the National Planning (Kumarappa) Committee. The committee was constituted at the instance of Jawaharlal Nehru.

Immediately after independence, in November 1947, the president of the Congress Party appointed the economic programme committee comprising some of the senior and most respected leaders of the party. This committee and its various sub-committees reiterated the national objective of economic justice. While stating the aims and objectives of the economic programme for independent India, the first recommendation of this committee was: "A quick and progressive rise in the standard of living of the people should be the primary consideration governing all economic activities and relevant administrative measures of the central and provincial governments. *The achievement of a national minimum standard in respect of all the essentials of physical and social well-being within a reasonable period must be pursued as the practical goal of all schemes for economic development*" [All India Congress Committee 1948:3; emphasis added].

The ideological commitment to poverty alleviation was supported by pragmatic considerations. Unlike several other countries which gained independence in

the 1940s and 1950s, the freedom struggle in India was by and large a mass movement. Large sections of the poor participated in the struggle for national independence with the hope that they would be given economic wherewithal once the country attained independence. The fact that the rich and the powerful sections, especially in the rural areas, sided with the British government made it easier for the nationalist forces to denounce the concentration of assets, particularly land, in a few hands.

The basic orientation of economic policy did not change after independence. In fact, it was further reinforced with the introduction of universal suffrage and a multi-party political system. Under these circumstances the slogan of poverty eradication, 'garibi hatao', was adopted by all political parties in one form or another. It was also possible to build a consensus on this objective, as on several others, as the core of the political system notwithstanding different party labels was characterised till the end of the 1960s by one or the other variant of democratic socialism. The Nehruvian approach to lifting the economy by its hootstraps by using science-based, capital-intensive industries as the lead sector, and public sector enterprises acquiring the 'commanding heights' in the industrial sector, had its adherents among a whole variety of groups and parties.

It is now well recognised that the translation of professed national goals into economic programmes and policies was fractured, deliberately or due to ineptitude, and that the objectives of economic and social justice remained largely unrealised. Before pointing out the failures and inadequacies of the poverty eradication programmes (PAP) pursued in India, we would like to emphasise the importance of the national agreement on the goal of poverty alleviation, since it is not a common feature among most of the developing countries; also, because such an agreement on the principle of poverty eradication blunted the edge of opposition to the measures for poverty alleviation. Such

measures as are discussed in the following paragraphs were, at least in the initial years of independence, aimed at far-reaching structural changes, e.g. land reforms. Yet none of these generated any active, overt opposition except by groups or parties at the periphery of the political system. The national consensus on poverty alleviation provided the *necessary* condition for launching various schemes and programmes aimed to achieve this objective. But the persistence of poverty during all these years suggests that the national consensus on objectives did not, and could not, provide *sufficient* conditions for poverty alleviation.

APPROACHES TO POVERTY ALLEVIATION

Drawing from the experience of a large number of experiments in rural development involving local communities, the government of India soon after independence launched the Community Development Programme (CD) to rejuvenate economic and social life in the rural areas. The emphasis was on infrastructure building at the local level and investment in human resource development through the provision of education and health services. The programme was implemented in well-defined geographical areas, or blocks. During the pilot phase of the programme, in a number of CD blocks remarkable results were obtained. Once the programme was expanded to cover the whole country, the weaknesses of the socio-economic system – of the administrative structure geared to targetry, of the social structure dominated by caste hierarchies, of an economic system characterised by rent seeking tendencies – came to the surface. The programme was not supported by appropriate technological and institutional reforms. Its impact on poverty alleviation was not conspicuous in any part of the country. The inadequacies and failures of this initiative, as well as some of its achievements, have been widely commented upon by Indian as well as foreign scholars [Dey 1969; Dore and Mars 1981].

The frontal attack on poverty was pursued in three successive phases. In the first phase,

lasting from the beginning of the 1950s till the end of the 1960s, the major emphasis was on redistribution of land and improving the plight of poor tenants: on abolition of functionless intermediaries, on tenancy reforms culminating in the principle of 'land to the tiller', on imposing ceilings on large holdings, sequestering surplus land and redistributing it among the landless agricultural labourers and marginal farmers. Apart from the anti-zamindari legacy of the freedom movement, uprisings of the poor farmers and landless labourers (the most notable example of such uprising was the Telangana struggle) also spurred the move towards radical land reforms.

However, by the time these structural reforms were introduced in different states, usually after lengthy legislative and legal procedures, the wealthier sections of rural society had consolidated their position and a middle peasantry was making its presence felt. The latter did not align itself with the poor farmers but identified its interests with those of the rich peasantry. Unfortunately, the launching of redistributive measures coincided with a growing deficit in foodgrains. Soon after the government had to assign a higher priority to the "grow more food" campaign and more or less abandon far-reaching structural changes. The net result was that redistributive land reforms could make a dent only on very large holdings and that too in a few states. It could directly benefit very few marginal farmers or landless labourers. Similarly, tenancy reforms benefited mainly the middle size tenants. The position of the small tenants deteriorated in many areas where the land was resumed by the landowners on the plea of 'self-cultivation', thus reducing small tenants to the status of tenant-at-will.

A parallel and complementary movement to state-sponsored redistributive land reforms was started by the leading spokesman of Gandhian thought, Acharya Vinoba Bhave. This movement believed in 'change of heart' of those who owned large resources to induce them to share some of their assets, notionally one-fifth, with their poor brethren. This movement, the "bhoodan" movement, achieved remarkable success in its initial phase, but soon degenerated into "targetry" and got diverted from its original purpose. Lack of sufficient effort to support the beneficiaries of the "land-gift" further weakened its contribution to poverty alleviation.

By the late 1960s the second phase of PAP started with measures that promised to address directly and exclusively the poor in the rural areas. This target group oriented approach started with the programme for backward regions, graduated to the programme for the development of small and marginal farmers, landless labourers, etc. and finally culminated in the Integrated Rural Development Programme and National Rural Employment Programme. Serious

efforts for poverty alleviation were initiated only during this phase. The distinguishing feature of the poverty alleviation programme during this phase was the emphasis on creating employment opportunities and distributing renewable assets among the poor. This was in sharp contrast to the intentions in the earlier phase, i.e., redistributing existing, non-renewable, assets. Similarly, heavy emphasis was placed during this phase of PAP on transfer of income to the poor in indirect ways, e.g., through food subsidies and 'dual pricing' of essential commodities. Recourse was taken to soft, non-confrontationist measures.

An important implication of this approach was that efforts at poverty alleviation were not conditioned by the political labels of the ruling parties in different states. The success or failure of these efforts were independent of whether a state was ruled by a rightist, centrist or leftist party. If poverty alleviation efforts were to concentrate on the redistribution of non-renewable resources such as land, the political base of the ruling parties would have made a significant difference.

In the third - the latest - phase starting from the beginning of the 1990s, emphasis has shifted to measures aimed at accelerating economic growth and on creating an environment for ensuring a 'spread effect'. In keeping with Indian traditions, lip-service is continued to be paid to structural change, as much as to target-group oriented programmes, but the dominant thought is to create more wealth and to enable the poor to benefit from the secondary effects of growth which, it is presumed, will percolate down and reach the poor.

Although over time relative emphasis has shifted from structural interventions, to a target group oriented approach, to market oriented policies, all states have acted in all these phases, more or less, in unison. If one finds different achievements in terms of poverty alleviation in various states, it is not because the major thrust of the programmes were dissimilar or the strategies were unique. Such differences have to be explained in terms of the initial social and economic conditions, specific geographical and demographic features, the pace and composition of economic growth, the relative emphasis placed on different poverty alleviation programmes, and the processes of and competence in programme formulation and implementation.¹ The studies in this issue examine many of these, and quite a few other, aspects of the poverty alleviation efforts in different states in India.

I

Design of Study

There is a uniformity of approach and, to a large extent, of content, of poverty alleviation programmes in India. The

implementing agencies for these programmes are the states. The outcome of poverty alleviation efforts, as is well known, differs from state to state. The dent in poverty in different states of the country can be explained only in the socio-economic, political, geographical and demographic context of the states; states' capabilities to implement such programmes; and institutions that exist at the ground level to support the disadvantaged sections of society. These assumptions were to be tested in the present study, titled 'Public Interventions for Poverty Alleviation: Experience of Indian States'. For this project nine states were selected for in-depth study: Andhra Pradesh, Bihar, Gujarat, Haryana, Karnataka, Kerala, Maharashtra, Rajasthan and West Bengal.² The temptation to include more states had to be resisted because of the paucity of time and resources.

The selection of states was mainly, though not solely, governed by the availability of scholars who have conducted serious studies of poverty related questions in their respective states. But once the states were selected, certain important characteristics of each state could be identified and related to its poverty alleviation programmes. For example, the selection of Haryana facilitated the study of the poverty situation in a dynamic rural economy. As against this, Bihar could represent similar initiatives in a stagnating economy with weak rural institutions. West Bengal and Kerala, both governed by leftist political parties, could illustrate a concerted move towards structural change in the rural economy in one case, and the impact of investment in human resource development in the other. Karnataka is one of the few states where decentralised development was tried out without initial political mobilisation. In Andhra, the intriguing feature was a favourable impact of PAPs on the poverty situation in the context of a stagnant economy. Maharashtra provided a unique example of guaranteed employment, virtually on the doorstep, to anyone who offers him/her for a job. Gujarat qualified for such a study because of its vibrant grass roots organisations, the co-operatives and NGOs. Finally, Rajasthan's inclusion could illustrate the nature of transient poverty which arises because of sharp weather-induced fluctuations in agricultural production.

There are several states with other distinctive features which could have been included for such a study. However, the paucity of resources and in some cases lack of serious studies in the area of poverty alleviation, inhibited inclusion of more states. At the same time, the states selected present a cross-section which highlights some of the major determinants of the success or failure of poverty alleviation programmes. While the main focus of the study was on the policies and programmes at the state level, it was realised that the importance of macro-

economic policies as well as overarching political processes for poverty alleviation programmes at the state level should not be missed.

The group identified to conduct this study along with a few other scholars met for the first time in Udaipur in July 1989. In this meeting the objectives and methodology of the study were discussed in detail. It was also decided that the major output of the study will be the nine state-level case studies. A format for these case studies was agreed upon. To examine national policies as they influence state level PAPs, a paper on Political Processes and Poverty Alleviation (by Kuldeep Mathur) was added.

Principally, each case study was to include:

- (a) discussion of social, economic and geographical features of the state as these impinge on poverty alleviation efforts;
- (b) discussion of rate and composition of economic growth and its impact on poverty alleviation;
- (c) a critical review of national PAPs (IRD, JRY, etc) in the state;
- (d) discussion of any major initiative taken by the state with the objective of poverty alleviation; and
- (e) suggestions for future directions to accelerate the pace of poverty alleviation in the state.

It was understood that the above format was only a suggestive one, and each case writer was free to amend it.

The same group with some alterations met in Jaipur in October 1991 and again in August 1992. In the latter meeting five of the nine case studies which were more or less in finished form were discussed in detail, and the outlines of four more studies were elaborated. It was also decided that the authors of those case studies which were more or less complete should take into account the comments made in this meeting before finalising their papers. The remaining four studies were also to be completed on the lines of the agreed format. It was further decided that one more meeting of the group will take place to take a final look at the case studies as well as to critique the overview paper. Unfortunately this meeting could not take place. But the remaining case studies were submitted to the chief co-ordinator of the project. Mainly on the basis of the case studies, but also using other relevant literature, the co-ordinator of the study, V S Vyas, in collaboration with Pradeep Bhargava, prepared the overview paper. The overview paper discusses:

- (i) the nature and extent of rural poverty and the trends in poverty alleviation in the country in general and in the selected states in particular;
- (ii) a critical examination of the general strategy as well as specific programmes for poverty alleviation; and

- (iii) a discussion of future directions on the basis of the above.

II

Extent and Nature of Poverty

There is no agreement among scholars on the extent of rural poverty in India. Estimates on the proportion of poor households among the total number of rural households for the year 1987-88, which is the last year for which country-wide reliable data from the National Sample Survey (NSS) are available, vary from 25 to 45 per cent. Some scholars have come to the conclusion that poor households constitute as little as 25 per cent of the total rural households [Dev et al 1992], while other scholars maintain that the proportion is as high as 45 per cent [Minhas et al 1991]. The official sources, i.e., the Planning Commission, place the rural poverty level at around 33 per cent of the rural population. An expert group appointed by the Planning Commission which included several distinguished economists placed the figure of rural poverty at around 39 per cent.¹ Even if some highly optimistic or highly pessimistic estimates are excluded, the figures on rural poverty given by different scholars vary significantly. Why should there be such a difference in the extent of poverty when the basic source of data used by all scholars is the same, i.e., various rounds of the NSS?

The starting point for estimating the number of households below the poverty line is a normative nutritional requirement per person per day at some base point. There is a debate on the minimum calorie requirement, and whether it should be the same for all parts of the country. Most acceptable figures are 2,400 calories per person per day in rural areas, and 2,200 calories per person per day in urban areas. The next step is to translate the nutrient requirement into monetary terms. The expenditure level of households which are able to spend the requisite amount to obtain the desired calories serves as the cut-off point, or the poverty line. To adjust the poverty line over a period of time, price variations have to be considered and an appropriate price deflator has to be selected. The problem arises in deciding upon such a deflator.

Thus, the following elements mainly affect the magnitude of the poverty ratio: (i) the nutrition norm (translated into monetary terms) in the base year; (ii) price deflator used to update the poverty line; and (iii) pro rata adjustment in the number of households in different expenditure classes to determine the number of households below and above the poverty line. Different assumptions and methods are used for these three purposes, which accounts for the different estimates provided by scholars.²

The assumptions made and methodology adopted by the expert (Lakdawala) group of

the Planning Commission appears to be the appropriate one. As mentioned above, the expert group has estimated the number of poor households in rural India at around 39 per cent of the total in 1987-88.

Over time a few noticeable changes have taken place in regard to the extent of rural poverty. First, in the last two decades there has been a continuous reduction in poverty. In 1973-74 the proportion of rural households below the poverty line was around 55 per cent (54.3 per cent to be exact). It went down to 52 per cent in 1977-78 and to 45 per cent in 1983, and now it is around 39 per cent. Thus, there has been a marked decline in the proportion of poor households in rural areas. Second, this decline is witnessed practically in every state of the country, although the magnitude of decline has differed. The important fact to be emphasised is that there has been a decline in poverty practically in every state.

Third, and it is important to note, even in the poorest states the pervasiveness of poverty has been reduced to a remarkable extent. For example, in 1977-78 in two states of our country, Orissa and Bihar, the proportion of rural households below the poverty line was 65 per cent and 75 per cent respectively. By 1987-88 there was not a single state which recorded such severe and pervasive poverty. On the other hand, in 1977-78 there was only one state, Punjab, which had less than 20 per cent of its rural households under the poverty line. By 1987-88 there were three states viz, Punjab, Haryana and Himachal Pradesh, where poverty was less than 20 per cent. More importantly, there are many more states which have made remarkable progress, from all-pervasive poverty to a rather manageable extent of poverty.

Fourth, there has been a noticeable improvement in the nutritional status of the poorest households as reflected in calorie intake. As mentioned earlier, the normative base for estimating poverty in our country is an intake of 2,400 calories per capita per day in the rural areas (plus an additional expenditure on other necessities), and 2,200 calories per capita in the urban areas (along with additional expenditure). Compared to these high norms of calorie intake, in a number of states the average per capita per day calories intake has come down. But inequality in food consumption has been reduced, and to that extent it can be reasonably assumed that malnutrition among the poorest deciles has come down to a considerable extent. These developments should be appreciated before asking the question why we could not do better.

Experience in poverty alleviation has varied in a significant manner among the states. We may divide the 18 year period from 1970-71 to 1987-88 into two sub-periods, the first between 1970-71 and

TELCO

THE HUMANITY TO SHARE

Telco Pattern programme with 58 villages around Pune and Jamshedpur villages where we sought to provide an impetus for any welfare programme the villagers wished to start. So we materials to construct primary schools were made available to every village the builders were the

villagers themselves. While 64,000 savings of the near 100 trees were donated by us the planting was done by the villagers themselves. While medical cars and equipment were provided by us the health workers were the villagers who had spawned the idea. The humanity to share. A force that will power Telco

to help in educating people by the end of the decade. A force that is part of a movement that will set new standards in human endeavour.

A MOVEMENT CALLED Telco

TATA
INDUSTRIES

Rediffusion TEL/023119

1977-78 and the second between 1977-78 and 1987-88 the first period may be called the pre poverty alleviation programme period and the second the post poverty alleviation programme period. In the first period the target group approach to poverty alleviation was absent. It was presumed that changes in agrarian structure and overall economic growth were the factors which would help poverty alleviation. As noted above during the second period roughly beginning from the late 1970s the target group oriented approach was accepted. Poverty alleviation programmes such as the Integrated Rural Development Programme (IRDP), National Rural Employment Programmes (NRELP) etc. were emphasised. Although these programmes were started earlier it was only from the late 1970s that these various schemes gathered momentum.

For the country as a whole the poverty ratio declined in the first period by less than 1 per cent. The decline in the poverty ratio was slightly above 9 per cent in the second period. We have observed above that there had been a fall in the poverty ratio over the period of time. It has to be noted that the decline in the poverty ratio was precipitated during the second period when deliberate targeted attempt were made to alleviate poverty. This outcome is of considerable significance.

The state wise picture of poverty reduction in the two periods is quite interesting. Decline in poverty was uniformly distributed between the first and the second period in Andhra Pradesh, Haryana and Tamil Nadu. West Bengal on the other hand observed a fall of nearly 15 per cent in the proportion of poor households in the rural areas in the second period as against only 4 per cent decline during the first period. This was also the experience of Karnataka and Kerala. It is significant to observe that states such as Karnataka, Kerala and West Bengal have better records in the implementation of PAP. What is observed at the state level does not necessarily hold true for all the regions of a state. There are sharp intra state variations in the incidence of poverty as well as extent of its decline over time. In most of the states there are high as well as low poverty regions. In Andhra Pradesh for example the backward regions have significantly higher incidences of poverty. The ratio of poor households to total number of households is increasing. There is growing concentration of poverty in the backward and poorly endowed regions of the state (Ramaswamy).⁴ Similarly in Maharashtra the inland eastern region has the highest incidence of poverty and the inland western on the lowest (Dev). In both Karnataka and Gujarat the regional disparities in this respect are remarkable and the regional concentration of poor households is widening (Basu, Hirway). Unfortunately enough

data on poverty at the regional level are not available to allow for a meaningful analysis. The results of the 27th round of the National Sample Survey (NSS) (for the year 1983) were presented for various NSS regions. The base year poverty differences in these regions could be highlighted with the help of these data. The 14 agro-climatic regions of the country could be ranked in terms of level of poverty. These regions however cut across state boundaries and therefore are not very helpful in understanding intra-state differences. In any case no such region specific estimates are available from the later rounds of NSS.

A few sporadic efforts are being made to understand the intra state poverty situation by researchers. The Centre of Economic and Social Studies (CESS) has developed district and regional level poverty estimates for Andhra Pradesh for the years 1977-78 and 1987-88. The only other effort of this nature that we are aware of is the regional delineation of the poverty profile for Gujarat done at the Sardar Patel Institute Ahmedabad. During the course of this study a similar attempt was made at the Institute of Development Studies, Jaipur to obtain poverty estimates for different regions of Rajasthan (Vidya Sagar). Apart from these few exercises there are hardly any other systematic efforts to assess the poverty situation at the regional level. As noted above poverty has declined over time in practically every state of the union but the states are large units. What is happening within a state i.e. in different regions is not carefully analysed. This is one of the major gaps in our understanding of the poverty situation.

CHARACTERISTICS OF POOR HOUSEHOLDS

As is well known it is largely the assetless among the rural households e.g. agricultural labour households who account for the most substantial block of poor households. According to the 38th round of the NSS at the all India level in 1983 agricultural labour households in the rural areas constituted 30.7 per cent of all rural households but their share in the poor rural households was 42.0 per cent.⁵ Nearly half of the rural poor in Andhra Pradesh, Bihar, Gujarat, Karnataka and West Bengal are agricultural labour households. These households are landless or have very small land holdings. Self employed agriculturists, mostly small and marginal farmers, form another major constituent of the poor households. As the case studies in this issue report, at the state level the difference in the incidence of poverty between agricultural labour households and those self employed in agriculture is relatively small in Andhra Pradesh, Haryana and Rajasthan while it is greater in West Bengal and Bihar. The relative importance of agricultural labour households versus marginal farmer households among the rural

poor reflects employment opportunities on the one hand and land holding structures on the other in the selected states.

Another distinguishing characteristic is the caste composition of the rural poor. The scheduled castes and tribes contribute disproportionately to the poor households in rural areas. For example in Kerala they constitute 10 per cent of the total population but 23 per cent of all poor. In all the states these groups (i.e. ST and SC) account for a disproportionately large share of the rural labour households i.e. the households who do not own productive assets.

The lesson is clear that rural poverty is directly related to lack of access to productive assets. It is for this reason that poverty alleviation strategies ought to focus more on providing productive assets to the poor. After the earlier phase of reforms in agrarian structure we did not make any serious effort in that direction. The reasons for the relative neglect of redistributive land reforms will be briefly alluded to below. However if we were to enlarge the definition of assets and include not only land but skills and capabilities and also physical stamina as the assets of the poor the programme of asset redistribution takes on another more manageable dimension. In fact the states that concentrated on asset generation for the poor understood in wider terms did much better than other states in terms of poverty alleviation. Before we narrate the experience in this regard it is important to understand the role which economic growth *per se* plays in poverty alleviation.

III

Economic Growth and Poverty Alleviation

Among various factors contributing to poverty alleviation economic growth has always been recognised as an important one. A view is gaining ground in the country that the money spent on PAP can be better utilised as investment in developmental activities and that the ensuing economic growth will be a better contributor to poverty alleviation. Assuming that all the money diverted from PAP will be fully and effectively used for development purposes and that such investment will generate growth (two rather heroic assumptions) – let us examine the role of economic growth in poverty alleviation.

The evidence from the experience of a large number of countries is that while the impact of economic growth on reduction in inequalities is mixed, its impact on poverty reduction is unambiguous [World Bank 1990]. However the benefits of growth are observed to be accruing to different economic groups approximately in proportion to their initial incomes. Further, the composition of growth appears to be important in explaining its impact on poverty alleviation. It is

generally agreed that growth propelled by an increase in agricultural output has a more pronounced effect on poverty alleviation.

In recent years the positive relationship between growth in agricultural production and poverty alleviation seems to have weakened [Gaiha 1991]. Even then the positive impact of agricultural growth on the income of small farmers, and more particularly on the wage income of agricultural labourers, cannot be denied. The latter is important. In the face of inequality in the distribution of land-holdings, the positive impact of agricultural growth on poverty alleviation depends more on the capacity to generate employment. A fall in elasticity of employment with respect to agricultural production, as observed in many areas, explains the weakening of the relationship noted above.

In this context, growth in the non-farm sector in rural areas assumes importance. This is clearly brought out in the study of poverty alleviation in Haryana (Bhalla). A significant reduction in rural poverty in Haryana in spite of a marked reduction in employment opportunities in agriculture could be explained by a remarkable increase in non-farm employment. The study of Andhra Pradesh has also brought out that poverty declined more rapidly in the districts adjoining Hyderabad city compared to those in the interior, mainly because of growth in non-farm employment on the periphery of this city (Parthasarathy).

Besides sectoral composition of growth, another factor which affects the 'trickle-down' of the benefits of growth to the poor is the availability of infrastructure, physical as well as institutional. Apart from the direct effect of the development of infrastructure on enabling a faster pace of trickle down, it also enhances the mobility of the poor, and with it the potential areas for employment opportunities.

A cross-section analysis of the 17 Indian states to explain fall in the ratio of poor households in rural areas between 1977-78 and 1987-88 [Vyas and Sagar 1993] suggests a significant and positive impact of the development of infrastructure and access to assets on the fall in the poverty ratio, while the impact of growth *per se* is, at best, weak. It is also observed that when there is a significant investment in human development (as reflected in an index of human development) and greater equality in the ownership of assets (as reflected in low concentration ratios) the 'trickle-down' effect of growth becomes more pronounced. In other words, growth is important but growth by itself will not ensure a 'spread effect'. The latter will be facilitated to the extent that there is (a) a developed infrastructure and (b) low concentration of assets, i.e., the poor also have access to productive assets. Once these two conditions are fulfilled, growth

will reach the poor. These findings have been corroborated by the case studies reported in this volume.

IV Strategic Intervention for Poverty Alleviation

As a general strategy for poverty alleviation, an emphasis on more equitable distribution of ownership and access to land, reforms in the credit delivery system to enable the poor command over productive resources; and a public distribution system (PDS) for foodgrains to contribute to improvement of nutritional standards of the poor by bringing down the real cost of foodgrains, have all played an important role in poverty alleviation in this country. These are all pro-poor measures. However, their less than satisfactory impact warrants a closer look at the efficacy of these programmes.

LAND REFORMS

The process of impoverishment of the rural masses in India is very well documented. There is a consensus on the role of colonialism, of the penetration of market forces and of the iniquitous social structure, on the widening and deepening of poverty in the countryside (Dasgupta). It is also commonly agreed that in the post-independence era, the pressure of population on land leading to sub-division and fragmentation of agricultural holdings, and lack of employment opportunities in the non-farm sectors worsening the plight of agricultural labourers, have further swelled the ranks of the poor. The emergence of a class of rentiers protected by the state and legitimised by the social system hastened this process. The bulk of the poor households in India are located in rural areas and among these, the vast majority are landless agricultural labourers and marginal farmers. More equitable access to land, therefore, would be an important poverty alleviation measure.

Land reforms as a programme for ushering in a just social order was an important item on the national agenda even before independence. The popular governments which took power in different states for a brief period in the late 1930s lost no time in legislating land reform measures. These reforms became more extensive and coherent after independence. An interesting aspect of land reforms in India is that although this is a state subject – only recently have some of the provisions of land reforms been brought under the concurrent list – the content as well as the timing of land legislation have been broadly similar in all states. Rather minor variations in the content or timing are easily explained due to special circumstances in the concerned state.

Land reform legislation broadly follows the following sequence throughout the country:

- abolition of functionless intermediaries;
- protection to tenants;
- imposition of a (rather liberal) ceiling on land holdings;
- ownership right to tenants;
- more stringent ceiling legislation.

There are a number of penetrating studies on the legislative content, implementation processes, and impact of land reforms on productivity and equity in different states in India. Some of the collaborators in this study (Dasgupta, Parthasarathy, Sharma) have documented the impact of land legislation on poverty alleviation in their respective states.

There are a few facts which need to be highlighted in the context of the present study. As a poverty alleviation measure, the main emphasis of land reforms until recently was on redistributive policies. The success in lowering of the ceiling on agricultural holdings (which was first introduced in the mid-1950s) in the early 1960s and again in the early 1970s was aimed at sequestering the surplus land and redistributing it among landless rural households or those with cultivated marginal holdings. Except for two or three states, e.g., West Bengal and Kerala, this programme did not make any remarkable impact on poverty. For the country as a whole the picture that obtains suggests that the land declared surplus was much less than what was anticipated; land acquired was much less than the land declared surplus; land distributed among landless labourers and marginal farmers was much less than the land acquired; and land which could actually be cultivated was much less than the land acquired. Leakages at every stage were glaring, and the reasons for this are well known.

The concentration ratio of landholdings did decline. In particular, the share of large holdings in total holdings went down in every state of the country. But these changes were mainly due to factors such as (a) demographic pressures leading to sub-divisions of holdings; (b) opportunities to increase agricultural output on medium size holdings by investment of capital rather than expansion of land; and (c) increased risk in further expansion of holdings in the face of ceiling legislation. The lowering of concentration of land among the large land holders was not because of effective implementation of land reforms by state bureaucracies, or the organisation of the intended beneficiaries. However, redistributive land reforms did contribute directly or indirectly to stopping the process of proletarianisation, in halting further expansion of large holdings, and contributing to the emergence of a middle peasantry [Vyas 1986].

In regard to the impact of tenancy legislation, after the initial 'shuffle' in the countryside, when a large number of tenants were evicted from land by landowners on the plea of resuming land for self-cultivation, things have started settling down. Even when allowance is made for concealed tenancy, the area under tenancy has declined, but those tenants who could formalise their tenancy agreements could be assured of legislative protection against eviction and enhanced rents. After the initial unsettling phase, most of the states have had a better record in tenancy protection compared to their performance in implementation of ceiling legislation. West Bengal has the most creditable record in this respect. State legislation on 'Bargadars' and its effective implementation with popular support at the village level ensured that share-croppers could not be evicted from their land and were assured of continuation of tenancy and a fair share of the produce (Dasgupta). In a few other states it is becoming difficult to evict share-croppers due to popular and radical organisation of the small peasants and landless labourers. For example, in parts of Andhra Pradesh and Bihar several groups known by the generic name of 'Naxalites' are protecting the rights of tenants, at times by violent means. In these areas the state machinery is also becoming more conscious about the implementation of land reforms and the plugging of various loopholes.

A question is posed in different fora as to whether land reforms are at all relevant in the present circumstances. According to some scholars, the urgency for implementation of land reform measures has been enhanced because of the re-emergence of a class of rentiers among the large landholders in some parts of the country. This in a way is a reversal of what happened during the phase of the 'green revolution'. The latter was characterised by a convergence of management and ownership of land, even in medium and large holdings. In the present circumstances, the affluent landlords find it more profitable to invest in non-agricultural occupations and assume the role of rent seeking absentee landlords rather than that of capitalist farmer (Parthasarathy).

Effective implementation of existing land reform legislation is important for more than one reason. Apart from the disruptive social implication of non-implementation of land legislation, such failures are also depriving the poor of participation in the development process. Second, land reform which assists in defreezing the lease market will be in the interests of the poor. A properly functioning lease market enables the poor to acquire land for cultivation to supplement their meagre holdings, or facilitates search for a non-agricultural work opportunity without the risk of losing land. This type of land

legislation will be a logical extension of 'Operation Barga' type reforms.

With the preoccupation of policy-makers with privately owned agricultural holdings, sufficient attention was not paid to the common lands till very recently. The disappearance of the commons or their pre-emption by the rich and powerful of village society has blocked opportunities for income generation for the poor from the products of the commons, apart from doing irreparable ecological harm. The damage done in this respect is more severe for the poor, whose dependence on the products of the commons is proportionately larger. It is only recently that steps have been initiated to rejuvenate degraded village commons and protect the rights of village communities, especially the poor, in the use of the commons. NGOs more than state functionaries are spearheading such activities.

Also, the exclusive attention paid to land has meant that the equitable access of the poor to forests, fisheries and water resources has not been appreciated. Only in recent years some steps have been taken to provide the poor access to forests, particularly the tribals living in or around forests. But in this respect legislation is probably at a stage where land legislation was in the 1950s. In regard to equitable access to water, in spite of several ideas being floated, hardly any effort has been made at the state level. Some voluntary organisations such as 'pani panchayats' in Maharashtra, have taken the lead in this direction.

ACCESS TO CREDIT

Availability of credit to the poor on affordable terms can create the preconditions for access to productive resources. With this objective in view, far-reaching changes have been introduced in the credit delivery mechanism in this country. These include expansion of the network of rural branches of the commercial banks, mandatory lending to priority sectors, discriminatory interest rates in favour of the poor, and the like. The objective of access to easy credit has been thwarted to a large extent by lack of proper response from the financial institutions. The credit institutions see lending to the poor as a burden rather than a good and feasible investment. Their approach to credit supplies for the poor have been developed without a fuller understanding of the poor's needs and aspirations.

By definition, the rural poor have few assets, but in many instances they do have some skills. One of the major constraints they face in making productive use of their assets and skills is access to credit. There are several limitations at their end – illiteracy and lack of awareness and experience with formal credit institutions. For women it may be especially difficult to obtain credit: the types of work women engage in may not be

recognised as productive enough to be creditworthy, and on many occasions social disapproval and family pressures discourage them from economic activities outside the home.

The poor generally need small amounts of credit. The credit requirement at times is a series of small, short-term loans for working capital which may ensure, for example, the supply of raw materials to carry out small-scale activities. They invest in activities with a quick cash turn around. Activities revolve around frequent marketing such as petty trade, food preparation, handicrafts using local raw materials, or services with a local demand. Some of the poor who make it to the external market need a higher amount of credit.

The big financial institutions generally find the proposed business of the poor to be too small to justify their efforts. They may impose unreasonable service fees for smaller loans and first time borrowers. Processing and/or administration of loans may take too much time away from the poor. Collateral requirements may be too rigid and repayment schedules inappropriate for the types of business pursued by the poor.

An important innovation in credit delivery systems has been the establishment of regional rural banks (RRB). These institutions are designed primarily to meet the credit needs of the poor. They do make small loans, mainly to the beneficiaries of the Integrated Rural Development Programme (IRDP); these are of fixed amounts and generally lack flexibility. There is no service fee but the loan application moves through a number of channels, increasing the transaction costs of both the poor borrower and the bank. The borrower still spends a lot of time chasing his or her application. The collateral condition for the poor borrower in the IRDP has totally been done away with, and the interest rate is lower than the market rate, but the loans are linked to a direct subsidy by the government. This erodes the authority of the banks (Parthasarathy). Repayments have been subjected to external political interventions. These, together with motivational and organisational handicaps, have impaired the effectiveness of the RRBs. The regional rural banks are too happy to see an IRD account closed when all repayments have been met. No attempt is made, rather no thought is given, to the needs of the IRD beneficiary after the loan has been repaid.

The opportunities given by IRDP, as will be discussed below, favour activities that promote redistributive (as reflected in the subsidies) rather than productive activities, and restrict opportunities rather than expand them. They seldom induce investment in education that increases productivity (TRYSEM is an exception). The organisations that develop in this institutional milieu could become more 'efficient' over time –

HELPING WOMEN STAND ON THEIR OWN FEET

Bank of India's

Priyadarshini
YOJANA

FINANCIAL ASSISTANCE TO
WOMEN ENTREPRENEURS

In keeping with its commitment to the upliftment of women, Bank of India has designed an exclusive scheme for women entrepreneurs. The scheme is applicable to small scale industrial undertakings, artisans, village and cottage industries, small road transport operators, small businesses, professionals and self employed, retail traders and agricultural & allied activities.

MAXIM/BOI

but more 'efficient' in making the poor even more dependent, and hence unproductive, with the basic institutional structure even less conducive to productive activity.

In the above context, some of the challenges that the credit delivery systems face are:

- (i) to create or expand the financial markets without distorting product or factor prices;
- (ii) to evolve a lending design that reaches the poor while minimising the transaction costs;
- (iii) to minimise the cost of lending operations while keeping the interest low enough for the poor to ensure participation;
- (iv) to design cost effective methods to scale up the service delivery mechanism both horizontally (among a larger number of poor or in a larger geographical area) and vertically (more investment opportunities for the poor who have already been successful in increasing their income);
- (v) to incorporate schemes which finance human capital formation so that the productive capacity and hence the creditworthiness of the poor enhances, and
- (vi) to meet the above challenges and ensure that credit programmes are being cost effective and are not dependent on external subsidies.

In other words, what is needed is a strategy that gives sustained livelihood to the poor as well as ensures the sustainability of the credit institutions. So far we have not been able to evolve such a strategy.

It is in this context that we should make conscious efforts to learn from the successful experiments in this country and abroad. Credit programmes such as the Grameen Bank of Bangladesh, the Action projects in Latin American countries, and the BKK in Indonesia have been successful in increasing the incomes of the poor while ensuring loan repayments. They have also been successful in varying degrees in empowering the poor. The major plank of the strategy of such credit programmes is to break the entry barriers for the severely disadvantaged sections who do not have the conventional prerequisites to entitle them to the services of the formal credit institutions. No economic collateral, no enhanced technological knowledge, no literacy, no money management experience and no social pull is necessary to start a project. Small loans are advanced, and once repaid, further loans are sanctioned. This is expected to initiate a creative process in which better know-how is developed, skills are honed and the confidence of the poor in themselves and in the credit management system develops. Women, who are marginalised in terms of acquiring and controlling assets, now have

access to formal credit and are being paid for their labour. They are able to gain control over their own lives, and most important, are able to organise better lives for their children, an activity for which they alone are responsible in a poor family. The financial principles are based on a form of social collateral as against economic collateral. In the Grameen Bank, a lot of emphasis is given to group formation with well laid out procedures. Larger amounts of credit are advanced if a loan is repaid. This incentive, plus pressure from the peer group, strong and decentralised management systems, the collection of repayments in small amounts suitable to circumstances in which the poor earn and live, together result in net repayments to the tune of 90 to 95 per cent in all these schemes. Transaction costs are kept low by a minimum of pre-loan screening and paperwork as well as by technical assistance. The poor have been able to increase their incomes and also accumulate some capital.

The design of these credit programmes has been singularly successful in not distorting credit markets by lending at the market rate of interest. Besides, the programmes pay the poor in cash and exercise no control over what they buy. Any control over their buying would have decreased the value of commodity for the poor and set distortions in the product and factor markets. With a continuous flow of credit, the programmes have successfully intervened in the interlocked markets where the poor borrower was tied to the local moneylender to buy inputs at a higher price and sell his output at a lower than market price. In the process it is reported that as the households have improved their economic position, the demand for consumption loans has declined.

The other major achievement of the successful programmes has been that the poor are able to 'voice'. Co-operative behaviour has become possible with individuals' repeated interaction, which enables them to have a great deal of information about one another. The challenge in our country in the field of credit, as in other fields, is to devise co-operative solutions to problems without the intervention of a coercive state.

PUBLIC DISTRIBUTION SYSTEM

Poor households spend nearly 80 per cent of their income on food. Therefore an effective way of enhancing real income and ensuring food security to poor households is an assured delivery of adequate quantities of foodgrains and other essential commodities at favourable prices, i.e. prices which are lower than the market prices. In India this has been attempted through the public distribution system (PDS) since second world war. Public distribution of essential commodities gathered momentum

in recent years. Between 1971 and 1989, the quantity of foodgrains distributed through the PDS has increased four-and-a-half times. The ratio of release of foodgrains through PDS to total foodgrains production has remained around 10 to 13 per cent of an expanding output base. Its coverage has expanded regionally as well as in terms of number of households. Probably because of the public distribution system, inter-state inequality in per capita consumption of cereals has declined in the 1980s, in spite of the fact that inter-state inequality in production of cereals has increased.⁸

A number of studies on the functioning of PDS and accounts given by participants in the PAP project have revealed several weaknesses as well as strengths of this system.

Taking the country as a whole, the system cannot be faulted for discriminating against the rural areas, although its contribution to the satisfaction of the foodgrains requirements of poor households is not substantial. Less than 16 per cent of rice and wheat and, even worse, less than 5 per cent of the coarse cereals (the staple foodgrain of the poor) of the total quantities purchased by poor households, are obtained through PDS. The picture at the state level is very dissimilar. There are states such as Haryana where PDS was never designed as "an instrument for ameliorating the rigours of rural poverty" (Bhalla). For altogether different reasons, PDS in Bihar also touches the lives of the poor only marginally (Sharma). On the other hand, there are states like Andhra Pradesh, Gujarat, Kerala and Maharashtra where the PDS plays an important role in ensuring food security to rural households. Accessibility to the PDS by the poor in rural areas of these states was much better than in many northern and the eastern states.

A well administered PDS can make a significant contribution to the welfare of the common people. This is illustrated by the experience in Kerala, where the PDS covers approximately 95 per cent of the population; there is a pro-rural bias in terms of outlets; there is a pro-rural bias in prices of the commodities distributed through PDS; and PDS is the main source of purchases of the principal staple foodgrains by the poor. Nearly a quarter of the lowest fractile group purchased rice exclusively from PDS. The same is the case, by and large, for sugar and for standard clothes.⁹

However, the success of PDS in Kerala, as in Andhra Pradesh, is achieved at a huge and unsustainable cost to the public exchequer. This is mainly because the states seek to cover a large population, deliver a large number of commodities, and keep stable prices for these commodities. There is confusion in the basic objective of the system. PDS could be used as an instrument for achieving any of the following objectives

or a combination of these: rationing of scarce commodities; stabilising prices of essential goods by augmenting supplies; providing effective competition to private trade through alternative outlets for distribution; and ensuring adequate supply of essential items to vulnerable sections of the population at reasonable prices. In our present circumstances it is only the last objective which can be effectively fulfilled by PDS, as other objectives either place severe strain on the bureaucracy which is the principal agency for administering PDS, or huge quantities of procurement or imports of foodgrains would be needed involving large sums of domestic or external resources. Due to these attempts to achieve various non-viable goals, the one achievable objective, i.e. ensuring adequate supplies of essential goods to the poor, is also jeopardised. Progressively the centre and the states are realising the scope and limitations of achieving food security through this policy instrument. In spite of this realisation, the coverage of the population under PDS remains unwieldy and the number of commodities included are large and not necessarily 'essential' from the point of view of poor households.

A serious objection to PDS has been voiced, that due to PDS prices of commodities in the open market would be higher than in a situation where PDS is not operating. As a consequence, the poor are the *net losers* if they have to take recourse to the market for the bulk of their purchases. The weighted average price for purchases from PDS and from the open market would be unfavourable to them. The implication of this finding is *not* to dispense with PDS, but to enable the poor to obtain all, or nearly all, of their requirements of essential commodities from PDS and to rely on the open market to the least extent for such commodities. A corollary to this strategy is to discourage universal coverage by the PDS.

The difficulty lies in targeting the right population. A number of PDS schemes meant exclusively for the poor – Andhra's Rs 2 a kg rice scheme is a classical example – founder because it has not been possible to target the benefits to the genuinely poor households. The non-poor also get included and coverage becomes too wide. This, coupled with a fixed supply price, make the draft on the state's resources unmanageable. The different methods of targeting (including the income criterion, the location of the household and the type of grains to be distributed) have not succeeded in achieving the objective. It seems that if PDS has to be used as a device to contribute to the food security of the poor, it may have to be linked with employment generating programmes – in other words, to make only workers on public employment schemes entitled to PDS. As a second best alternative, only (or mainly)

the staple cereals consumed by the poor need to be procured for and distributed through PDS outlets. It was shown in the case studies (Andhra, Kerala, Maharashtra) that the reliance of the poor on PDS for coarse cereals is marginal, whereas they could obtain a sizeable proportion of their supply of wheat and rice from PDS. The other handicap which the poor face *vis-a-vis* PDS, which prompts them to take recourse to private traders, is the lack of credit to make the purchases in bulk as are offered by PDS outlets. The traders are prepared to sell commodities in small quantities, and as frequently as the customer desires, and also to advance credit to their customers. The PDS will also have to simulate similar conditions. In particular, arrangements for consumption credit will go a long way in fulfilling the objective of PDS to assist poor households.

Evidence from a number of states suggests that even with the existing limitations, the availability of essential food items through PDS has ensured equity in access to foodgrains to a significant extent.

V

Targeted Programme for Poor

PROVIDING ASSETS AND SKILLS: IRDP AND TRYSEM

The poverty problem is one of too small a quantity of assets owned by the poor, too low a volume of demand as well as supplies while transacting in the factor and product markets, and too low a market price for their products and services due to high transaction costs, attendant risks and institutional factors. It is generally agreed that improving the access of the poor to assets and increasing the productivity of assets owned by them is a viable strategy for poverty alleviation. Redistribution of a major asset, land, has been discussed in the earlier section. The productivity of another major asset of the poor, namely, their labour, can be increased through investments in human capital including skill enhancement. We begin with an analysis of access to physical assets and enhancement of the productivity of these assets.

The survival base of a very large majority of the rural poor continues to be agriculture. They may own a small landholding and/or work on others' lands as agricultural labour. In areas like Haryana where an 'agriculture first' growth strategy has worked, even small farmers have gained in income and output terms. They have gained equally from public investments in infrastructure and easier access to factor and product markets (Bhalla). This may not be true for other areas, e.g. Andhra Pradesh, where a majority of the marginal farmers and agricultural labourers are outside the purview of state-sponsored

delivery systems (Parthasarathy). The least desired scenario is presented by the example of Gujarat where not only has agriculture been deemphasised, but mismanagement of land and water resources has led to environmental degradation.

Schemes such as SFDA and DPAP have been designed to benefit both marginal farmers and landless labourers by strengthening their activities in sectors like agriculture, animal husbandry and other allied activities. Similarly, marginalised groups were the main beneficiaries of the Backward Area Development Programme, which was also to contribute to protection of the environment and ecological regeneration. The experience of these programmes has been far from satisfactory (Hirway). It has been the general experience that the assets distributed among the poor sections would be put to better use if the infrastructure and market support is good. Otherwise the returns to these assets could not be assured.

Access to assets other than land – the distribution of which as we have seen is becoming difficult – could provide additional income to the poor. A very wide range of such assets can be listed. They may include livestock, raw material for arts and crafts for artisans, small implements or even a better means of transport (a bullock cart or bicycle). In some cases these assets may provide substantial income even to those households which primarily depend on land. The most important programme which is aimed at providing additional income to the poor by giving them productive assets of the type listed above is the Integrated Rural Development Programme (IRDP).

The case studies reveal that IRDP has been successful in very special circumstances – where the asset and employment base of the poor is less insecure. IRDP has done well mostly in developed and prosperous areas, but its performance in backward and remote areas has been poor (Hirway). Even in the relatively prosperous areas, IRDP has benefited those of the poor who are nearer the poverty line. For the very poor the scenario is mixed. In Gujarat, for example, those at the bottom have either not been reached by the programme or have not been able to use the assets made available to them productively (Hirway). However, in Andhra a good number of the very poor could retain the assets given to them under the programme and also show an appreciable increase in income, though not to the extent that would enable them to cross the poverty line (Parthasarathy). In Rajasthan, too, because of IRDP small and marginal farmers have done better than landless labourers (Sagar). The same is true in Karnataka where the programme has benefited the poor who have land, but not so much the landless poor (Vyasulu).

The strategy of IRDP has been questioned on the ground that it is isolated from the main growth process in terms of resource allocation, technology as well as sectoral development strategy. It is not planned along with other programmes of area or sectoral development, it is a household based programme, and the schemes are not integrated with the development needs or resource base of the area. The design of the schemes is also an important drawback as they generally reflect inadequate financial assistance for inadequately planned activities (Kannan). Besides, IRDP expects too much in terms of the entrepreneurial capacity of poor households (Hirway). The management of IRDP has come under severe criticism: poor co-ordination among the multiple agencies involved, and a major weakness in the areas of finance and credit, marketing, raw material supply, training, technical assistance and follow up. Other limitations are too much bureaucratisation and centralisation in planning and implementation of the programmes by the officials, who have limited faith in implementing the programmes; inefficiencies and corruption at all levels; and lack of participation by the people (Hirway).

A few suggestions emanating from the case studies for improving the programme are: a cash disbursement scheme which is expected to minimise leakages (Sharma); group approaches and integration of beneficiary development for reaching benefits to the poor (Parthasarathy); Grameen Bank type of credit disbursing agencies (Vyasulu); the selection of beneficiaries and implementation of poverty alleviation programmes with the involvement of local people, as in the Karnataka panchayati raj institutions; and setting up of marketing organisations to help micro-enterprises (Kannan). To sum up, when a large-scale transfer of assets to the poor is envisaged through programmes like the IRDP, the necessary backward and forward linkages have to be strengthened and risks to the households have to be minimised.

Another crucial aspect of asset distribution is the development of skills to use the assets productively. Capital investments in improvement of the skills can be a major step in poverty alleviation. Similarly, investments in the nutrition, education and health of the poor enhance their capacities for productive labour. One of the major programmes for skill development is TRYSEM. The objective of this programme is to provide youth with some skills so that they can be self-employed. None of the states reviewed by the authors of the case studies have reported success in TRYSEM, and the basic reason is the absence of linkages, especially with the demand system, i.e., a proper assessment of the opportunities where the skills could be gainfully used. TRYSEM

is neither linked with industrial policy nor with the rural industrialisation process. The trades in which skills are to be developed are identified on the basis of *ad hoc* considerations. Frequently the skills imparted are of low levels. Since the needs are not identified after any systematic review of demand, the training does not always help the poor to improve their levels of living. TRYSEM has failed to impart modern skills for employment in the non-farm sector. Instead of supporting the mainstream industrialisation process, it could at best support the informal residual sector (Hirway). Trysem is not well integrated with ongoing development programmes. To strengthen the programme, better linkages in consultation with the agricultural university, krishi vigyan kendras and voluntary organisations are necessary. There is a need to link up the programme more closely with the growth of the area (Parthasarathy).

Some relevant questions can be raised: Is it possible for trained rural youth to sustain a self-employment enterprise in a severely competitive market with the poor technological base that TRYSEM provides? How does he manage his credit needs? Is he creditworthy? What will make him creditworthy – better technology, or better organisational support? Who will provide him with all this? The problems are more serious for the rural artisans. Some successful experiments in organising rural artisans in non-farm sector projects with technological and organisational support from voluntary agencies have been undertaken under the promotional schemes of NABARD.¹¹

EMPLOYMENT GENERATION: EGS AND JAWAHAR ROZGAR YOJANA

Wage employment programmes are expected to provide relief to the unemployed poor and have an impact on aggregate unemployment as well as on the labour market. They are also expected to increase labour absorption capacity through investment in durable and income generating public assets. They may also provide social infrastructure such as school buildings. Such programmes can help in creating public goods and externalities, e.g. through social forestry. In this context some of the relevant issues are: the extent of employment generated and its impact on unemployment and poverty levels; the level of wages and its impact on the labour market; and the organisation of the programmes. The other set of issues pertain to the nature of assets created and whom they benefit.

Employment programmes were not perceived as major instruments of poverty alleviation until the beginning of the 1980s in most states of the country. They were expanded in the Sixth Plan period under the National Rural Employment Programme (NREP) and the Rural Landless Employment

Generating Programme (RLEGP). These programmes were modified combined into the Jawahar Rozgar Yojana (JRY) in 1989-90. In Maharashtra, through the enactment of the Maharashtra Employment Guarantee Act 1977 which has been brought into force in 1979, the government has given statutory support to the guarantee of employment, which has manifested in the Employment Guarantee Scheme (EGS).

The extent of employment generated through these programmes in most of the states is not enough to enable a sizeable number of poor households to cross poverty line. In 1988-89 in Gujarat, NREP and RLEGP together generated full employment for 2.2 per cent of the poor, which is equivalent to 100 days of employment for 5.9 per cent of the poor. The employment generation per beneficiary was around 30 days per annum. Thus the programme had made no significant impact on the incidence of unemployment in the state till 1988-89 as its size was too small compared to the needs. The average amount of wage income received through the programmes have not made much impact on the levels of living, savings or on assets of the families. (Hirway).

Even the EGS scheme could eliminate approximately no more than 7 per cent of unemployment among landless wage labourers in one year, namely, 1987-88. The estimates on expenditure show that there should be almost a 20 times increase in the EGS expenditure if unemployment has to be removed through public works (Dev). Some micro studies indicate that the employment provision of person days per person in a year varies between 25 to 160 days. The share of income from EGS for those employed in the EGS has ranged between one-third and two-thirds. However this has only reduced the intensity of poverty rather than achieving success in terms of the number crossing the poverty line.

There are other instances which put the programme in a better light. For example, in Andhra the employment generation programme provided seven man days on an average per usually employed casual labourer in 1989-90. Assuming 45 days of unemployment per casual labourer, the employment under JRY in a particular year covered slightly more than 15 per cent of the unemployment. This should be considered a significant creation of employment (Parthasarathy). The person day unemployment rate based on NSS data declined considerably over time in Andhra. In this state, poverty reductions have continued despite a downward phase in the agriculture cycle. This is, presumably, due to the impact of rising expenditure on public intervention programmes of which employment programmes, contribute more than one-third (Parthasarathy).

In the above context, we are faced with

The Lakshmi Vilas Bank Ltd.

Regd & Admn. Office
KARUR - 639 006

EXCERPTS OF THE SPEECH DELIVERED BY SRI. G.V. RAO, CHAIRMAN, AT THE SHAREHOLDERS MEETING HELD ON 15TH SEPTEMBER, 1995 AT KARUR.

DEAR SHAREHOLDERS,

I take pleasure in extending you all a warm welcome to this 68th Annual General Meeting. I am extremely happy to address this august gathering fourth year in row, a notable event repeated after a gap of almost two decades. The Bank's Accounts for the year ended March 31, 1995, alongwith Directors' Report have already been circulated to you in advance.

ECONOMIC SCENARIO

It is four years since the Narasimha Rao Government initiated economic reforms which were aimed at regenerating confidence on India, building the Foreign Exchange Reserves and stimulating private investments, both domestic and foreign. The liberalisation measures started yielding results from the second half of 1993-94. With a sustained revival in the industrial activity coupled with a high level of agricultural production for the seventh successive season, the gross domestic product in 1994-95 has risen by 5.6% compared to 4.3% in 1993-94 and the Inflation Rate was pegged down to 8.5%.

The industrial sector witnessed remarkable recovery after the lull trend noticed in the year 1993-94. The liberalised licensing procedures and incentives have aided faster growth in exports in spite of keener demand for various goods in the domestic segment. The Balance of Payments position has been highly comfortable, with foreign exchange reserves rising to an all time high of 20 billion dollars, in spite of stoppage of fresh inflows by way of GDR issues.

With inflation getting well under control and favourable prices in the world market aiding exports, the rupee can be stable against all major currencies of the world. The liberalised corporate sector and the reforms carried out so far would provide the engine of growth and we should aim at double digit growth in GNP to address the remaining issues effectively.

BANKING SCENARIO

By the year 2000, the people of the world will be drawn much closer. This will result from genuine revolution in telecommunication, transportation and expansion of international trade, cutting across the intercontinental contours. This development paves way for change in the banking. The forces of change in the banking are globalisation, deregulation and technological change and innovation. These forces crumbled the edifice built over 2 decades by quality of service rendered than on the volume.

Banks are necessitated to adorn large capital consequent on the requirement of Prudential Norms.

With the emergence of new Banks in the private sector, the competition will be severe and at times may lead to adverse conditions. Banks will have to choose a strategic position in which they can build on their strength. The moot point will be accurate identification of the markets and understanding and anticipating the customers needs. The most promising key to success in the retail market in the years to come will be the strengthening of cost competitiveness.

In spite of the fact that the future Indian Banking to be indeed exciting, challenging and highly competitive, dynamic banking organisations with a visionary leadership will profit immensely in a situation of this kind.

HIGHLIGHTS OF OUR BANK'S PERFORMANCE

Your bank has earned a Net Profit of Rs. 18.32 crores for the year 1994-95. The spurt in the profit strengthened the Reserves of the bank to reach as high as Rs. 41.33 crores.

The Deposits of your bank touched a all time high of Rs. 1037.27 crores in 1994-95 from Rs. 584.39 crores in 1993-94.

Your bank has shown sustained growth in Foreign

Exchange business turnover at 271.32 crores in comparison to Rs. 226.18 crores in 1993-94.

Your bank recorded a voluminous growth in Investments by reaching an aggregate of Rs. 417.18 crores in 1994-95 from Rs. 214.37 crores in 1993-94.

As a SEBI classified category I Merchant Banker the Bank has made giant leap by mobilising Rs. 1246.85 crores encompassing 325 capital issues as compared to Rs. 249.85 crores from 231 issues in the year before. Your bank plays a dominant role, ranking second amongst the private sector banks in India according to Prime Data Base by extending underwriting support for 199 capital issues covering an amount of Rs. 2415.12 lacs as against Rs. 1956.69 lacs for 192 capital issues in the year before.

The bank has opened 6 more branches viz. Mettur, Valasaravakkam, West Tambaram (Tamil Nadu), Chitradurga (Karnataka) and Gandhi Nagar, Anand (Gujarat).

To enlarge the acceptability base of our credit card, the bank has entered an arrangement with Visa International.

The bank's emphasis is to employ advanced technology to the mutual benefit of both customers and bank and in line with it, our on-going investments are being made to enable the bank to render speedier service and also to sharpen the Internal Control Mechanism.

In a Service Industry like ours, one of the raw materials is human resources. Appreciating its criticality, the bank is constantly training its staff at various levels in the bank's own Staff Training College as well as other outside institutions such as NIBM, SIDTC.

ACKNOWLEDGEMENT

I would like to thank the members and also the Bank's Staff and Executives for their dedicated service.

Note: This does not purport to be the proceedings of the Annual General Meeting of the Bank.

LAKSHMI VILAS BANK LTD.

questions such as what should be the extent of the programmes? What is the rationale of extending these programmes? And how should the programmes be budgeted among different regions? These questions can be answered satisfactorily only in the context of the respective states. Some of the studies in this volume have attempted to throw light on the issues raised here.

One of the important measures taken by the state in favour of the disadvantaged sections is the institution and implementation of minimum wages. There has always been some controversy about the impact of minimum wages on the labour market. The consensus of opinion is around the view that where market imperfections are rampant and interlocking of markets not very uncommon, state intervention in terms of the declaration of minimum wages helps in rationalising market processes. However, the rationale of minimum wages in rural markets is challenged on another ground. If the objective is to extend employment to as large a section of the population as possible, the insistence on minimum wages may detract from this objective. On the other hand, if the state itself is not honouring its legislation, for whatever reasons, the creditability of such a legislation is seriously impaired.

This discussion is highly relevant in the context of the employment programmes sponsored by the states. The debate in Rajasthan was manifested in a strong movement launched by the workers on famine relief type activities in the state, some of these covered by the Jawahar Rozgar Yojana, to obtain minimum wages. In many instances government officials took the line that giving minimum wages to these workers would mean a trade off between employment on a few or the provision of a safety net to many.¹

There is a similar controversy in Maharashtra. In the EGS the wage rates have been kept more or less at the subsistence level. There is controversy regarding wage rates under the EGS. The dilemma is between paying the minimum wage rate or the market wages (which are above minimum wages); some others argue that lower wages should be maintained in order to have wider coverage. In Andhra, minimum wages are non-operative in most regions for most operations because market wages are higher. There is need for identification of areas and seasons in which minimum wages are lower than market wages. Real wages are on the rise in Andhra. Similar trends as in Andhra are observed in some districts in Rajasthan. The contribution of NREP to the phenomenon of missing wages is complemented by the increase in agricultural growth rate in some areas, a shift to labour intensive crops in semi-arid regions and the spread of peasant movements, e.g. the naxalite movement in Telangana. There are instances where employment programmes have proved

ineffective in influencing agricultural wages. For example in Kerala the impact on the rural labour market in terms of raising the minimum wages, reducing cyclical fluctuations in employment and reducing the gap between men and women is minimal (Kannan).

Another related problem is that of paying minimum wages to rural workers. In Gujarat the stipulated minimum wages were not paid in a majority of cases examined by the scholars. However, the Gujarat government at its own initiative started special unemployment programmes known as Zero Unemployment District in 1990-91 and Minimum Unemployment Scheme in 1991-92 respectively. Some distinguishing features of these two programmes are that they are restricted to carefully selected areas and that the households are carefully selected and divided into two categories, i.e. those going in for self employment and others for wage employment. These programmes have not been systematically evaluated so far. However, it was found that the funds required for zero unemployment in the selected districts were far too large and the availability of such funds did not seem likely (Hirway).

The employment programmes are not meant only to transfer income to the poor. The objective is to create productive assets or to strengthen the production base. Quantitatively, the achievements in the generation of productive assets are too low to make much impact. The primary objective of employment generation gets neglected in most states, as concentration is on assets that require more capital such as construction projects like panchayat ghar, housing, etc. These works benefit the rich more than the poor. Works like soil conservation, minor irrigation, watershed development and afforestation which create more employment presently and create opportunities for employment in the future as well have been neglected. Even in EGS, public pressure was for construction of roads. Only lately is the integration of EGS with schemes for optimum utilisation of water, sericulture plantations, and dug wells for small and marginal farmers being envisaged. It was pointed out, for example in the case of Andhra Pradesh, that greater emphasis needs to be placed on development of irrigation and the efficiency of its use. In locating the programmes adequate weightage is not given to communities with poor water base and dependence on low employment intensive coarse cereals (Parthasarathy). On the other hand, projects for creating private assets, e.g. setting up dug wells for small and marginal farmers, proved to be more successful.

One of the major failings of both the self-help and the wage labour programme is a weak organisational base, including weak linkages between different programmes. Various studies point out the weaknesses such as inappropriateness of the choice of

projects, use of contractors, inappropriate timings, higher material costs and unauthorised deductions by engineering staff. Generally, the implementing agencies take up ad hoc projects and get them executed at the minimum possible wages. Payments to labour are inordinately delayed, thus failing to provide immediate relief to the unemployed. The shift from NREP to JRY seems to have contributed to the involvement of elected representatives and widespread participation. The need for competent district planning as a backdrop for employment planning is yet to be fully met.

VI Summing Up

The major programmatic thrusts for poverty alleviation were more or less common throughout our country. Strategies and programmes were initiated by the central government and were accepted by all the states. With a large degree of common measures undertaken to alleviate poverty, the studies in this issue attempt to examine why some states have been more successful in reaching this objective than others.

In a developing economy there are essentially four ways by which poverty can be alleviated. The first is the 'trickle down' or the 'spread effect' of growth. It is now well known that it is not the rate of growth but the composition of growth which determines the pace of the 'spread effect'. The pace is significantly affected by the existence of infrastructure which helps in the 'trickle-down' of the benefits of growth. But what is generally not appreciated is that in order to receive the impact of growth, poor households should have the capacity to respond to growth stimuli. Growth might have created the opportunities, but if people are not in a position to respond to these stimuli, poverty alleviation cannot take place. What are those conditions which permit poor people to respond to these opportunities, thus, becomes an important question.

The second approach to poverty alleviation is to create income earning opportunities for the target group of the poor. The states which could create not only employment opportunities but also infrastructural facilities to sustain them had a better record in poverty alleviation. Equally important is access to assets, understood in the wider sense to enable poor households to take advantages of these various programmes. Poverty alleviation measures like IRDP have made some impact in a few states. But if we examine the type of households that have been able to cross the poverty line, which is the objective of these schemes, we find that those households, which are closer to the poverty line, presumably the households which had some assets to start with, have been able to reap the advantages of these programmes to a larger extent.

Third, a policy on relative prices can influence the economic well-being of the poor. The public distribution of foodgrains at lower than market prices, i.e. dual pricing of essential commodities, is the type of measure which illustrates such an approach. Finally, the economy of poor households can be favourably affected by direct income transfers. In the developing countries there are not many examples of direct income transfers to the poor. Usually such transfers take place, indirectly, by 'dual pricing' for the essential products. Except in times of natural calamity, and then also to a small group of households, direct transfer of income to the poor is the exception rather than the rule.

It is not suggested that a country like India or the states within the country should opt for only one or the other type of measure for poverty alleviation. Practically in all states all these various approaches have been tried simultaneously. The first three approaches, namely, growth inducing measures, direct poverty alleviation programmes and indirect subsidisation, have been practised with varying degrees of importance attached to them. Why, then, has the outcome differed from one state to the other in such a significant manner? The significant lessons learned from the studies include:¹²

(1) Success in poverty alleviation efforts was not significantly affected in our country by the professed political ideology of the ruling parties in different states. Poverty alleviation has been adopted as a legitimate political objective, and the poor as an important constituency, by parties of every colour and composition. This was mainly because poverty alleviation efforts in our country comprised 'soft' measures, e.g. the distribution of renewable resources, subsidies, dual pricing, etc.

(2) Faster economic growth by itself does not guarantee a significant impact on poverty alleviation. At the same time slow economic growth is generally associated with low impact on poverty alleviation. Even with faster economic growth targets of poverty alleviation could be missed; with slow economic growth there is little chance of alleviating poverty.

(3) Practically all successful states, i.e. successful in better performance on poverty alleviation, have made sizeable investments in poverty alleviation programmes. This needs to be emphasised in the context of the recent economic reforms. One can easily find instances when funds earmarked for poverty alleviation programmes are not well spent, or the funds are not spent in a manner that ensures sustainable growth. But even with a poor record in programme implementation, generally the states which have invested heavily in programmes such as IRDP or Jawahar Rozgar Yojana, or in the earlier employment generation schemes, have distinctly better records. So long as

poverty alleviation continues as one of our important economic goals, irrespective of the tenets of structural adjustment, emphasis on investment in these programmes has to continue.

(4) Larger investment in infrastructure has helped the states in their quest for poverty alleviation even when the rate of growth in the state domestic product was low. This was mainly because better infrastructure facilitated the 'spread effect' of growth.

(5) Concentration of ownership of assets, which may reflect lack of access or inadequate access of the poor, is generally associated with a slower pace of poverty alleviation. But there are a significant number of exceptions. Based on available evidence, one can conclude that if the poor have access to assets – to be interpreted in broader terms, i.e. including skills and capabilities – there are better chances for poverty alleviation even with slower economic growth.

(6) In some cases, as in Kerala, high investment in human development could compensate for slower economic growth, and could even negate the effects of a skewed distribution of physical assets.

(7) In some rare cases, such as in Gujarat, a state can make satisfactory progress in poverty alleviation in spite of several unfavourable factors, with more efficient implementation of PAP and involvement of grass roots organisations in programme formulation and implementation.

To conclude, the experience of several Indian states suggests that if the strategies for poverty alleviation are properly planned and implemented, even without spectacular economic growth or a major overhaul of the institutions and structures, the poverty ratios among rural households could be brought down to a tolerable limit.

Notes

- 1 For a different view see Kohli (1987), wherein the author emphasises the importance of the regime-in-power to explain the existence of political capacity to initiate effective poverty alleviation measures. He gives the example of West Bengal to prove his thesis. However, as the case studies in this volume will show, there are states such as Haryana or Himachal Pradesh where the political regimes could not be called radical and yet where, because of the factors we have enumerated above, the performance of PAP was better than that in West Bengal.
- 2 The case studies of the selected states were prepared by G Parthasarathy, Alakh Narain Sharma, Indira Hirway, Sheila Bhalla, Vinod Vyasulu, K P Kannan, Mahendra Dev, Vidya Sagar and Biplab Dasgupta.
- 3 All these estimates pertain to year 1987-88, the latest year for which detailed householdwise consumption data are available from NSS.
- 4 For a detailed discussion on various aspects of methodology for enumerating poor households in rural areas, see Planning Commission (1993).
- 5 The names in parentheses are those of the case study writers.

- 6 The estimate of poverty is as made by Mahendra Dev in his case study in this issue.
- 7 For a review of the Bangladesh experience see the World Bank working paper by Islam et al (1994).
- 8 This finding is attributed to T N Krishnan as presented by him in an unpublished lecture delivered on the same subject.
- 9 This is not true for wheat and kerosene, to which middle fractiles depend more on PDS. This is because in the consumption pattern of the poor these items do not figure prominently, and the higher income group take greater recourse to the open market to obtain these items.
- 10 In one such scheme known as the Artisan Guild, traditional artisans have been exposed to new technology with the help of a voluntary organisation to produce commodities of a identified and viable product line. For detail see Bhargava (1994).
- 11 At the Institute of Development Studies, Jaipur, in a consultation exercise between NGOs, policy-makers and some academics there was a consensus of opinion towards the end of the discussion that minimum wage be paid to famine relief workers. See Gianchandani (1991).
- 12 These findings were also reported in an earlier paper by Vyas and Sagar (1993).

Public Intervention and Rural Poverty

Case of Non-Sustainable Reduction in Andhra Pradesh

G Parthasarathy

Andhra Pradesh presents a unique case of poverty reduction, its performance between 1970 and 1988 being the highest among all the major states. This trend is not surprising for the 1970s, a period of rapid agricultural growth, but is perplexing for the latter part of the 1980s when growth had slackened. These trends point to the significance of public intervention for poverty alleviation, in particular the Rs 2 a kilo rice scheme, which is evaluated here. However, the most effective measure that could be taken to reduce poverty is land reform, without which other schemes cannot have much impact

ANDHRA PRADESH presents a unique case of poverty reduction between 1970-71 and 1987-88, its poverty performance being ranked the highest among all the major states of India [Minhas et al 1991]. Such a performance is understandable for the 1970s, during which period agricultural growth in Andhra Pradesh was high, but is perplexing¹ particularly for the latter part of 1980s during which agricultural growth performance had considerably slackened. Such developments lend particular significance to an examination of the role of public intervention and its implications for a sustainable reduction of poverty.

The main objective of this paper is to evaluate public intervention programmes for the rural poor against the background of the socio-economic context, trends in growth and rural poverty in Andhra Pradesh. The first section of the paper outlines the rural socio-economic scene, examines the growth processes and trends in rural poverty, and outlines the changing profile of the rural poor. The second section presents an evaluation of alternative public intervention programmes for the rural poor. The third section reviews the 'two rupees kilo rice' programme, widely acclaimed to be the most popular among the interventions. The final section discusses selected issues in public intervention and outlines directions for the future.

I

Rural Socio-Economic Scene, Growth and Rural Poverty

The state of Andhra Pradesh, constituted in 1956 in its present form, is comprised of three distinguished regions, viz, (1) drought-prone Rayalaseema, (2) Telangana, formerly part of the princely state of Hyderabad, and (3) Coastal Andhra, comprised of the Godavari, Krishna and Pennar deltas in the south, and the former zamindari areas of the north coast, bordering Orissa. As of 1991 the population of the state was 66 million. Of this, the rural population comprised 48 million forming 73 per cent of the total

population. Within the rural population, 69 per cent were engaged in agriculture. Within agriculture, persons occupied as labourers exceeded the self-employed. The female participation rate in agricultural labour is high and female agricultural workers exceed male agricultural workers. Land distribution continues to be unequal in all the regions. For Andhra Pradesh as a whole, in 1986-87 around 10 per cent of the medium and larger farmers held 44 per cent of the area, while the bottom one-half of cultivators held less than 15 per cent of the area. The bottom one-third of the holders possessing less than 0.5 hectare or 1.0 acre held only 5.0 per cent of the area. The main occupation of the large majority of the sub-marginal cultivators is agricultural labour. Most of the marginal cultivators and agricultural labourers are drawn from backward castes, scheduled castes and scheduled tribes. Of the total population, backward castes formed 38 per cent,² scheduled castes 16 per cent and scheduled tribes 7 per cent.

Medium and large landowners generally belong to upper caste groups, who continue to wield power in co-operatives, panchayats and other rural institutions, though the 'politics of accommodation' [Rami Reddy 1989] has resulted apparently in some diffusion of power to other groups in recent years. The sharp division among rural communities, particularly in the affluent deltas, into landowning upper castes and landless dalits, creates conditions under which the struggles of the dispossessed for civil rights, land and wages are turned into violent caste wars against dalits, and brutal massacres of scheduled caste workers have not been uncommon in recent years. Alienation of tribal lands to non-tribals and deprivation of tribals to access to minor forest produce have also been sources of conflict leading periodically to Naxalite movements, in Srikakulam district in northern Coastal Andhra in the late 1960s and in Telangana in the 1980s [Subba Reddy 1988; Parthasarathy 1992]. The high degree of landlessness and growing casualisation of labour have been associated

with growing market dependence of rural communities.

GROWTH OF AGRICULTURE AND ALLIED SECTORS

The continued predominance of the rural sector, and within that, the agricultural sector, lends importance to the growth of foodgrain and agricultural production for the improvement of the living conditions of the mass of people. In regard to foodgrain production, the first decade since the formation of Andhra Pradesh was marked by a low rate of growth, much less than the rate of growth of population and of the labour force.³ This was also the pre-green revolution phase. As we shall see below, there was no significant improvement in the incidence of rural poverty during this phase. The second decade was the first phase of the green revolution. The shift to HYVs, spurt in the use of modern inputs such as fertilisers, and shift in acreage from low yielding coarse cereals to high yielding rice following irrigation, stepped up foodgrain yields. As a result, rates of growth in foodgrain production during the second period showed a marked rise, much above the rates of growth of population and of the labour force. The incidence of rural poverty during the period showed a sharp fall. What is worth noting is that all regions of Andhra Pradesh participated in the benefits of growth, and regional imbalances in foodgrain production recorded a sharp fall as compared to the first period. The third decade after the formation of Andhra Pradesh was marked by a setback in the rate of growth of foodgrain production. The rate of growth was slightly less than the rate of growth of population and only slightly higher than the rate of growth of the rural labour force. Severe land constraints, slowing down of the green revolution, and shifts of cultivated area from coarse cereals to oilseeds, have been responsible for the downslide. What is noteworthy is that the poverty-prone regions recorded a sharper decline in the rates of growth. Rayalaseema showed a negative growth and the rate of growth in

Telangana was less than half the rate recorded in the earlier period. Available evidence from the data base of CESS does not suggest that the rate of growth of total agricultural production was higher for this period. The agricultural output index computed by the CESS recorded a rate of growth of 2.53 per annum for the period 1979-80 to 1989, while for the earlier period, 1971-72 to 1978-79, it was 3.26 and statistically significant. Yet as we shall see in the next section, the incidence of rural poverty continued to fall, calling for an examination of public intervention programmes and their bearing on the observed decline in the incidence of rural poverty. Such an examination becomes all the more relevant in the context of the growing numbers and proportions of marginal and small cultivators, declining proportions of regular salaried employees, and rising numbers and proportions of casual labour within agriculture. According to the NSS 43rd round, 1987-88, agricultural labour households formed around 40 per cent and total labour households around 49 per cent within the rural area. This figure was 10 per cent more than what is observed for all-India. Certainly, the case of Andhra Pradesh presents a paradox of high and growing proletarianisation, lower rate of agricultural growth, and reduced pauperisation, as we shall see below. The fall in rate of growth of agricultural production in the 1980s was associated with a fall in the rate of growth of allied products such as milk, fish, etc., in the 1980s.

The decline in the rate of growth of irrigation in the 1980s, as compared to the rate of growth in the 1970s, explains in part the fall in the rate of growth of agricultural production. The rate of growth of net irrigated area for the 1970s was of the order of 1.0 per cent. But in the 1980s the entire period was marked by stagnation in overall irrigation, except for a peak in 1983-84 under good weather conditions. The most affected source of irrigation was tank area under this source showed a continual decline except for 1983-84. Even other sources of irrigation showed near stagnation except for the area under tube wells, which formed less than 3.0 per cent of the total area under irrigation in 1981-82, and around 5.0 per cent in 1987-88. The decline should have affected the employment and incomes of the agricultural labour class. Yet, as we shall see in the next section, the incidence of poverty was less in 1987-88 as compared to 1983-84. The puzzle gets more complex and needs to be resolved.

ABSORPTION OF RURAL LABOUR

The organised sector covers all establishments in the public sector and non-agricultural establishments employing 10 or more workers in the private sector. The total

employment in the organised sector, in 1990 [CMIE 1991] was 1.7 million, 1.4 million in the public sector and 0.3 million in the private sector. This formed only around 6.0 per cent of the total employed labour force of 29.6 million – 23.8 million in rural areas and 5.8 million in urban areas. The share of the organised sector in total employment in Andhra Pradesh is also relatively low. Among the major states, only five states, namely Rajasthan, Madhya Pradesh, Orissa, Uttar Pradesh, and Bihar, record lower shares than Andhra. At the current rate of growth of the organised sector, it has very poor absorption capacity of rural labour, no more than 8.0 per cent of the additions to the rural labour force. Trends in employment in registered factories were equally depressing. Given such trends, it is difficult to explain the falling rates of unemployment and of incidence of rural poverty in the 1980s.

In contrast to the trends in the organised and factory sectors, small-scale industries registered with the Small Industries Development Organisation showed a higher rate of growth in the 1980s than in the 1970s. The rate of growth of small-scale units between 1981 and 1986 was 16.5 per cent per annum, compared to 3.0 per cent per annum between 1961 and 1971. However sickness in small-scale units has been rising in the 1980s.

Employment in khadi and village industries was only 3.44 lakh, and rates of employment in this sector have been showing a decline. The handloom industry in particular has been facing a crisis, resulting in much hardship to workers in this sector. However, there is a suggestion from the economic census of 1980 and 1990 that the rates of growth of employment in the service sector has been increasing at a faster rate. The census showed that the number of persons working in all enterprises increased at a rate of 3.5 per cent per annum, from 4.6 million to 6.5 million. As in 1980, for which distribution by the type of enterprise is available [CMIE 1991], more than 60 per cent of the workers in non-agricultural enterprises were in trade and services. It appears that the 1980s were characterised by a faster growth of in trade and the service sector. This however requires closer scrutiny.

HUMAN RESOURCES DEVELOPMENT

The performance of AP in literacy and health, two critical aspects of human resources development, has been less than that in other south Indian states. As of 1981, overall rural literacy in Andhra Pradesh was only 44 per cent of the urban rate. Rural female literacy rates formed an even smaller proportion, one-third of the urban rate. The literacy rates among the scheduled castes and scheduled tribes were the lowest. Telangana fared worse than other regions.

between 1981 and 1991 there was some improvement in the overall rates of literacy among all social groups and in all regions but the position of Andhra Pradesh as a literacy state among south Indian states unchanged. This position was the direct result of the failure to promote universal primary education. Non-enrolment and drop-out rates of children, especially among rural labour households, continued to be high. Recent village studies show a reduction in drop rates even among agricultural labour households. Even so, high non-enrolment and high drop-out among children agricultural labourers continue to be notable [Peraraju Sharma 1984]. Subramanyam showed that two-thirds of drop-outs in study were poor and more than one-third severely so. Poverty was the major cause of drop-outs in backward areas and among backward social groups. Other factors, such as single teacher schools and inadequate implementation of 'Operation Blackboard' slowed down the progress of primary education in rural areas. Many children in rural areas continue to grow into adulthood without the rudiments of education, far more than boys.

Between 1977-79 and 1987-89 there was some reduction in the infant mortality rate, yet the position of the state compared to other south Indian states continues to be disappointing. As against 25 in Kerala, 41 in Karnataka and 73 in Tamil Nadu [CMIE 1991], the infant mortality rate in Andhra Pradesh was 81. Illiteracy among women is found to contribute to high infant mortality rates. Among households with illiterate women, infant mortality rates in rural AP were 1.71 times the corresponding rate for women in households with literate women. Mothers with high labour participation rates in rural areas require public support for primary health care of their children. In the absence of such support, infant mortality rates tend to be high. Among households with women labourers in rural Andhra, the IMR was noted to be 1.38 times the corresponding rate among women not participating in labour. Scheduled caste and scheduled tribe households recorded high infant mortality rates [Government of India 1990]. Studies on health status [Ranigopal 1987; Chandrashekhar, Sanjeeva Reddy; Ranigopal 1989], while noting a decline in infant mortality rates and death rates in recent years, note large gaps between the health infrastructure planned and the actual state, and inadequacies in primary health care, and continuing high morbidity rates.

The relatively poor performance of Andhra Pradesh in health and literacy is not unrelated to the relatively low expenditure per capita by the state government. The per capita expenditure on health in AP is Rs 63, as against Rs 82 in Kerala and Rs 71 in Tamil Nadu for 1987-88.

triennium ending 1989-90. Similarly, the per capita expenditure for the same period on education was: AP, Rs 136; Kerala, Rs 206; Tamilnadu, Rs 148; and Karnataka, Rs 149 [CMIE 1991].

Low human resource development means that one possible route to sustainable escape from poverty is closed to the rural poor.

RURAL POVERTY

Montek Ahluwalia's (1978) pioneering study provides estimates of trends in rural poverty for AP for the period 1956-57 to 1983-84. In this study the poverty line at 1960-61 state rural prices was Rs 15.5. In the 1956-57 the incidence of poverty was 53.5 per cent. In 1960s, except for a sharp dip in 1964-65, the incidence fluctuated around 45 per cent. The incidence of rural poverty showed a falling trend only in the 1970s.

A comparison of the incidence of rural poverty in AP with all-India shows a distinct pattern. For the period 1959-60 to 1961-62, the incidence of rural poverty in AP exceeded all-India levels. From 1963-64 onwards and up to 1973-74, it was less than the all-India incidence. This pattern is found to be related to the changing poverty line of AP in relation to all-India. For the first period (1959-60 to 1961-62), the poverty line of AP was higher than for all-India, in the second period starting with 1963-64, it was lower. This suggests that the lower incidence of rural poverty in AP compared to all-India is related, in part, to lower levels of the consumer price index for agricultural labour (CPIAL).

Further, Ahluwalia's analysis showed that while a number of states, viz., Bihar, Karnataka, Orissa, Rajasthan, Uttar Pradesh and West Bengal, recorded a positive and significant time trend in the incidence of rural poverty, AP was unique in showing not only a trend decline in the incidence of rural poverty, but a statistically significant decline [Ahluwalia 1978]. What is puzzling is that for the period under examination, the growth rate of agricultural output was low, and growth per capita of rural population was near zero [Parthasarathy 1988; Mahendra Dev 1988]. The growth rate of the total crop sector at constant prices was only 0.51 per cent for AP between 1962-65 and 1971-73, as against 2.47 per cent for all-India for the corresponding period [Bhalla and Tyagi 1989:35]. The statistically significant declining time trend in the incidence of rural poverty is difficult to explain in the context of poor agricultural performance for the 1960s. A possible explanation is the lower rate of growth of the CPIAL Index for AP as noted above.

For the period since 1970-71, we have estimates for discrete five year intervals. These are presented in Table 1 for AP and all-India. The estimates differ widely.

However, in all the estimates the incidence of rural poverty in AP shows a decisive decline and is lower than all-India. The rate of decline in the incidence of poverty is also higher in AP. As in the earlier period starting in 1962-63, this period is also characterised by lower CPIAL and consequently, a lower poverty line for AP. But, unlike in the late 1950s and 1960s, the 1970s in AP was marked by a significantly higher rate of growth of food and agricultural production. While labour productivity in AP showed a negative growth rate between 1964-65 and 1972-73, it grew at a compound rate of 3.6 per cent per annum between the triennium. The benefits of growth in the 1970s were shared by all the regions. At the all-India level, the corresponding rate of growth was only 1.8 per cent per annum. Thus, there is strong evidence to suggest that poverty reduction in the 1970s was growth induced.

In the 1980s the rates of growth of foodgrain and agricultural production, as well as of industrial production, have slackened. Regional imbalances in foodgrain production, which were on the decline in the 1970s, emerged in a sharper form. The year 1987-88 was a comparatively bad agricultural year and foodgrain production was less by 5.0 per cent as compared to the average of 1982-83 and 1983-84. Yet there was a decline in the incidence of rural poverty, which by no means could be attributed to growth.

Again, for the time points for which Minhas et al present estimates, AP and Kerala are the only two states which managed to reduce the incidence of rural poverty and also the number of rural poor in both the periods. Between the two states, the performance of AP was noted to be better [Minhas et al 1991]. In the ranking of the performance in poverty alleviation, AP is assigned the highest rank (Table 2). The unique performance of AP, and the bearing

of public intervention programmes on this, should be of wider interest. Before an examination of these issues, the changing profile of rural poverty is presented.

CHANGING PROFILE OF RURAL POVERTY

For a study of the changing profile of rural poverty, data from a state sample which are available in a more disaggregated form for the NSS rounds, 1977-78 and 1987-88, are considered more useful than the data of the central sample for these two periods. The state sample data for both the years suggest a higher incidence of rural poverty but the order of decline does not vary very much between the findings of the two sets.

Further, we wanted to satisfy ourselves that what we are analysing reflects a time trend and not just a change between two points of time. An examination of the data for the 1970s and 1980s showed a declining trend in the rate of growth. Since the direction of change is similar for two points of time and also for the 1980s as a whole, we could suggest that growth induced reduction in rural poverty could not be expected to be significant for the 1980s.

The average size of the household of the rural poor was 5.16 as against 4.57 for all households. The percentage of children in the total population is also higher, 46.88 compared to 38.36 for all. While expenditure on cereals formed one-fourth of the total expenditure for all, for the rural poor it formed 37 per cent. Similarly, food expenditure as a percentage of total expenditure formed 60 per cent for all; for the rural poor it was around 72 per cent. Quantity of cereals consumed per capita per month was 12.66 kgs as against 14.35 kgs for all rural persons. The rural poor consumed coarse cereals in larger proportion, i.e., 30 per cent of their total cereal consumption as

GOVIND BALLABH PANT SOCIAL SCIENCE INSTITUTE, JHUSI, ALLAHABAD

Advertisement No. 4/1995

WANTED:

- 1 Professor (Two) of Political Sociology/Social History/Geography (Human) in the pay-scale of Rs 4500-150-5700-200-7300

QUALIFICATIONS

First or high second class Master's Degree from an Indian University or an equivalent degree from a foreign University in the area of study concerned Proven research capabilities in terms of publication, Ph D , independent handling of project and/or effective participation in major research projects, at least seven years experience of teaching/research as a Reader or equivalent post in a substantive capacity in a University/Research Institute The age of superannuation shall be sixty years

- 2 Readers (Two) of Political/Economic Sociology,/Social History/Education in the pay-scale of Rs 3700-125-4700-150-5300

QUALIFICATIONS

First or high second class Master's Degree or equivalent Degree from a foreign University in the area of study concerned A Doctorate Degree or publications of a high order Reputation for sound scholarship and competence for research guidance and/or handling of research projects At least five years experience of teaching/research as a Lecturer or equivalent post in a substantive capacity in a University/Research Institute The age of superannuation shall be sixty years

3. Research Assistant (Temporary) – One In the pay-scale of Rs 1640-60-2600-75-2900 plus other usual allowance, as per rules of the Institute

QUALIFICATIONS

At least a second class Master's Degree in Sociology/History/Political Science/Economics and a good academic record, possesses an aptitude for research and is keen to learn. Those possessing higher academic qualifications, knowledge of research methodology and experience of field work will be preferred

Candidates may apply on the prescribed form to be had from the Institute for posts No. 1 and 2 on payment of Rs 5/- and for the post No 3 on Rs 2/- in cash or by money order (not postal order); Rs 12/- extra in case the form is required by registered post There is no application fee for scheduled caste and scheduled tribe candidates The closing date for submission of application form is 30 November, 1995

against 20 per cent for all. In 1987-88 the per capita consumption expenditure of the rural poor was 33 per cent of the average for all. The additional expenditure required was of the order of 20 per cent to bring the average of the poor close to the poverty line. The incidence of rural poverty for the districts as estimated in CESS studies [Reddy 1991a] is classified by :

(1) occupational groups; (2) level and quality of irrigation; and (3) traditional geographical regions.

In 1977-78, the highest incidence of poverty i.e., 75.99 per cent, was among agricultural labour households. The lowest incidence of poverty i.e., 41.31 per cent, was among the 'others' category. Those self-employed in agriculture recorded a poverty incidence of 53.79 per cent. After a decade, i.e., in 1987-88, all occupational groups showed a decline in the incidence of poverty. But the order of poverty with regard to the highest and the lowest remained unchanged; agricultural labourers continued to record the highest incidence of rural poverty - 54.19 per cent - and 'others' the lowest incidence - 24.64 per cent. Yet, even while the ranking by incidence of poverty remained unchanged, the percentage decline varied. The maximum percentage decline, from 53.79 per cent to 24.64 per cent, was among the 'self-employed in agriculture'. The lowest percentage decline was among labour households.

As a result of such differential benefits, the share of agricultural labour households in the total poor population increased from 40 per cent in 1977-78 to 56 per cent in 1987-88, and of total labour households from 44 to 63 per cent. Simultaneously, the share of 'self-employed in agriculture' among the rural poor declined from 37.0 per cent to 23.0 per cent. A significant part of the decline was in canal irrigated southern coastal Andhra.

The districts for which the disaggregated data of CESS on poverty are presented are classified by levels of irrigation and within each level, by canal irrigation, tank and other sources of irrigation. In both the points of time districts with higher levels of irrigation show lower incidences of poverty. Within each level of irrigation, the incidence of poverty is invariably higher under conditions of poor quality of irrigation. Poverty levels show a fall in 1987-88 as compared to 1977-78 within all categories. Regions with a major proportion of area under irrigation, and irrigated areas with a major proportion under canal irrigation, recorded the lowest incidence of poverty at both points of time. The highest incidence of poverty was in the least irrigated area, with a major proportion of irrigated area under tanks and wells, both in 1977-78 and 1987-88. Though the order of incidence of poverty remained unchanged, the rate of decline varied considerably. The largest

declines were noticed in regions with high levels and relatively good quality of irrigation. The least decline was in the least irrigated areas with poor quality of irrigation, and also those with very poor quality of tank irrigation though recording more than 50 per cent of area under irrigation.

As a result, the share of the total poor in areas with lower quality of irrigation rose from 50 to 60 per cent between 1977-78 and 1987-88, while areas with a better quality of irrigation recorded a fall from 50 per cent to 40 per cent. A similar fall is seen in better irrigated areas as compared to areas with lower level of irrigation.

In regard to the historically traditional geographical regions, all groups showed a fall in the incidence of poverty. The order of poverty among the groups remained unchanged: Rayalaseema recorded the highest incidence and coastal Andhra Pradesh, the lowest incidence, during both points of time. Yet there were differential rates of decline: coastal Andhra experienced the highest rate of decline and the least rate of decline was in Rayalaseema. Within coastal Andhra, the poorest of the regions, i.e., north coastal Andhra, recorded a lower rate of decline. As a result of such differential rates of decline in poverty, the share of Rayalaseema and Telangana in the total rural poor increased.

Poverty among Agricultural Labourers

Since we notice an increasing concentration of agricultural labour among the rural poor, we portray the changes in their composition between 1977-78 and 1987-88. The details are shown by (1) levels and quality of irrigation, and (2) traditional geographical regions. At both points of time the incidence of poverty among agricultural labourers is higher in regions with poor quality of irrigation, given the level of irrigation. Given the quality of irrigation,

the incidence is the highest in the least irrigated areas. This holds good for both points of time.

In regard to region-wise changes in the incidence of poverty among agricultural labourers, there was a decline in all regions, but the order of incidence across regions remained unchanged. The rates of decline in the incidence of poverty were the lowest in Rayalaseema, which recorded the highest incidence as of 1977-78, and the highest in the coastal Andhra region. It may be noted that coastal Andhra maintained high rates of growth in the 1980s despite an overall decline in the rate of growth. In this region unlike in the other two regions, reduction in poverty among agricultural labourers could be said to be growth induced.

Finally, we looked into the changes in the incidence of poverty among agricultural labourers of Rangareddy district, close to Hyderabad city, and Vishakapatnam district in which Vishakapatnam city is located. In these two cities urban and industrial growth have been taking place. We expect such high rates of growth to have an impact on rural poverty via impact on rural wages and employment. As expected, the rate of reduction in the incidence of rural poverty between 1977-78 and 1987-88 was of the order of 50 per cent, a figure higher than that observed for canal irrigated regions. But what should be noted is the limited possibilities of escape from poverty through this route on a wider scale.

Among the various social groups, scheduled castes and scheduled tribes continued to show a higher incidence of poverty as per the data of the 38th round (NSS central sample). The poor formed around 50 per cent among the scheduled castes and scheduled tribes while the overall average was a little more than one-third. This is associated with a higher degree of landlessness and higher proportions of labourers among scheduled castes, besides

Source: Minhas et al 1991

their disadvantageous social position within the rural communities. Further, the diversification in occupations witnessed in rural areas since the 1970s did not benefit the scheduled castes. Among scheduled tribes landlessness is less common, but alienation of land has been contributing to growing landlessness.

The severely poor, on the assumption that their per capita income is less than 70 per cent of the poverty line, formed 39 per cent in 1977-78 and 34 per cent in 1983, suggesting a decline in the proportions of severely poor.

Poverty and Unemployment

The section above has shown that there was a perceptible reduction in poverty between 1977-78 and 1987-88. This is plausible if it is associated with reduction in unemployment and rise in real wages. For the purpose of examining unemployment we choose the most comprehensive measure, Daily status unemployment rate, which stood at 8.24 per cent for males and 12.45 per cent for females in 1977-78, declined to 4.90 per cent for males and 9.40 per cent for females, respectively, in 1987-88. Real wages, which had been stagnant for a long period since the formation of AP state, had shown an increasing trend, particularly since 1977-78 [Reddy 1991a]. The reduction in unemployment and rise in real wages in coastal Andhra are understandable since this region has maintained a high rate of growth both in the 1970s and the 1980s. But in the other two regions, neither reduction in unemployment nor rise in real wages could be attributed to growth since growth rates were lower than the rates of growth of the rural labour force in the 1980s. We must look for a possible explanation in poverty alleviation programmes, and also in violent labour movements, particularly in Telangana.

Poverty and Cereal Consumption

The reduction in rural poverty is worth nothing if not associated with a rise in cereal consumption per capita. In fact cereal consumption per capita has declined from 15.85 kgs in 1977-78 to 14.35 kgs in 1987-88 for rural areas as a whole. A scrutiny of the data on quantity of cereal consumed by expenditure groups, after adjusting for changes in the price index when considering the group-wide data for different points of time, also suggest that there have been falling trends in cereal consumption even for the poorer groups between 1977-78 and 1987-88. This phenomenon is noticeable at the all-India level also. This is surprising in view of the high income elasticity of demand for cereals and also their high price elasticity. Radhakrishana (1991) attributes this to the

weakening links between food production and food entitlement, and also to weakening income-food entitlement links due to declining elasticity of employment to output, besides changes in the tastes of consumers towards non-cereals. There is further evidence in the data of the NSS 38th round, relating to the continuance of hunger among a significant proportion of the rural population. Around 16.0 per cent of rural respondents did not say 'yes' to the question of whether all members get two square meal a day throughout the year. They said that they got two square meals a day only in some months of the year. For the poorer sections in rural AP the percentage reporting 'only some months of the year' ranged between 20 per cent for the marginally poor and to as much as 45 per cent among the severely poor sections within the bottom 10 per cent of the rural population. The incongruity between reduction in poverty and the continuing prevalence of hunger on a significant scale raises complex issues in policy for food security which need to be satisfactorily resolved.

II

Public Interventions for Poverty Alleviation

Public interventions for poverty alleviation included programmes for (a) provision of access to land and water for the poor; (b) asset and skill development and access to institutional credit; (c) employment and minimum wages; (d) basic needs covering food, public distribution system, shelter, and other requirements for the identified rural poor, and (e) social security.

ACCESS TO LAND AND WATER

The earliest of public interventions for poverty alleviation was provision of access to land through land reforms. Among the major land reform programmes, abolition of intermediaries did not change the ownership structure of landholdings directly. But it had two indirect effects: first, implications for growth, and, through its percolation effects, on poverty. Second, it freed rural labour from the grip of the zamindar and from his control over common property resources. The zamindari and jagirdari areas covered two-fifths of the area and were mostly located in north coastal Andhra, Telangana, and Chittore and Nellore districts. Most of these districts have been historically deprived in terms of social and economic infrastructure and they continue to be among the poorest regions.

Under the land ceiling legislation only 3.03 per cent of the total area owned was declared surplus. Of this less than one-half was redistributed. The surplus distributed formed only 1.43 per cent of the total owned

area. Beneficiaries formed only 1.01 per cent of the total owners of below one hect, including, the landless. Even the surplus obtained was mostly dryland; only 5.3 per cent of the total land taken possession of was wet. Studies on ceiling surplus land indicate the inadequacy of efforts to secure possession and to develop land [Agro-Economic Research Centre 1981]. It may be concluded that the ceiling legislation provided little direct benefit to the poor. But its indirect benefits, in contributing to a shift from rent to entrepreneurial agriculture, to growth and thereby to a reduction in poverty through percolation effects in the deltas of coastal Andhra, cannot be discounted.

Despite resummptions for self-cultivation and evictions, around one-fifth of the owners below two hectares, including zero owners were found to lease in land in 1983. The corresponding percentage of those leased out within this group was only around 6 per cent. Marginal and small owners account for 60 per cent of the total leased in area [Parthasarathy 1990b]. An effective implementation of tenancy legislation, which ensures reduction of currently prevailing rents of 50 per cent of the produce to 25 per cent could benefit a significant proportion of the poor. But a total absence of recognition of rights of tenants and oral and insecure tenancies render such implementation difficult. Renewed rhetoric in the absence of mobilisation of support for reform at the grass roots level may only lead to deterioration in access to land for marginal owners and the landless, growth in informal tenancy, and more insecure conditions affecting both equity and growth [Parthasarathy and Rao 1989; Parthasarathy 1991].

Recent trends in the districts of AP suggest a rise in tenancy due to a number of factors: (1) increasing shift of large and medium owners into more lucrative non-agricultural occupations, along with a shift from rural to urban locations; (2) entry of the entrepreneurial agriculturist class into trade ventures in rural areas and partial leasing out by resident landowners; and (3) growing problems of labour especially during peak seasons, resulting in increased leasing out by large landowners. The issue of feasible effective intervention in the land market versus lukewarm interventions which worsen both equity and growth, needs consideration.

In terms of magnitude, the amount of waste land distributed to the land-poor in AP is large; between 1969 and 1987, 11 million hectares were distributed. If, on the average, half an hectare was distributed to each of the beneficiaries, it should have covered 3.0 million out of 5.80 million owners holding less than one hectare as in 1893. In terms of magnitude this appears to be quite an achievement and rather unbelievable since the total owned area

those who owned less than one hectare was only 1.25 million hectares, and of those who owned less than two hectares, only 2.94 million hectares. Possibly a significant part of the land distributed was not to the landless and small owners. There is little available information on the extent to which waste land distribution benefitted the poor. It is unfortunate that the reviews of progress prepared by the finance and planning department of the government of AP do not have anything to say on the status of lands distributed, the extent to which they are under the occupation of the beneficiaries and the benefits derived by them.

Deprivation of tribals of their land leading to support to the growing Naxalite movement should be considered an important issue for public policy. Tribal deprivation took two major forms: alienation of land, and declining access to forests, a source of tribal livelihood. Government action towards the tribals moved in cycles of indifference and drift [Subba Reddy 1988, 1989].

Our analysis in the preceding section based on evidence from CESS shows a growing concentration of poverty in AP in dry and poorly endowed areas. In these areas, even the self-employed in agriculture record a high incidence of poverty while in the deltas, the incidence of poverty among the self-employed in agriculture is insignificant. Further, the destitute form an insignificant proportion of the poor in the irrigated zone as compared to the dry zone. Therefore, access to water and efficiency of use of water within the poorly endowed high poverty regions needs attention. Irrigation development in the 1980s did not necessarily benefit the districts with high incidence of poverty [Parthasarathy 1991a]. High gaps between potential and utilisation and tail end problems in major irrigation projects [Yousuf 1988; Iqbal 1989, Agro-Economic Research Centre 1991]; siltage, non-operation of sluices, occupation of tank beds, and poor maintenance [Agro-Economic Research Centre 1986a; Institute of Development and Planning Studies 1989]; falling water levels in wells [Reddy 1988]; rainage problems in the deltas; and slow progress of the watershed development programme [Walker and Ryan 1990] affect growth and keep the poverty levels higher.

ASSET DEVELOPMENT

Public intervention to enable the rural poor to cross the poverty line through development of assets and skills was started during the Fifth Plan period and has assumed importance since 1980. The target groups under this programme are small and marginal farmers and agricultural labourers and rural artisans with incomes below Rs 6,400. A minimum of 30 per cent of the beneficiaries

should belong to the SCs and STs and a minimum of 30 per cent should be women. The beneficiaries are eligible for subsidies; 25 per cent for small farmers, 33.3 per cent for marginal farmers, agricultural labourers and rural artisans, and 50 per cent for tribal farmers. In Andhra Pradesh, around 2.5 million rural families, or 60 per cent of the rural poor, were covered under IRDP between 1980 and 1990. Funds utilised per beneficiary family, both subsidy and credit together were of the order of Rs 4,000 [CMIE 1991].

The concurrent evaluation however provided a less depressing picture in respect to several indicators. In AP use of gram sabhas for selection of beneficiaries was better than in other states. With regard to the percentage of households crossing the poverty line, AP's position was shown to be better. But even according to this only 7 per cent of beneficiary households crossed the poverty line though a much larger percentage were reported to have improved their income [Parthasarathy 1990a:259]. Group approaches and integration of beneficiary development with area development were needed to achieve effective benefits for the poor. As of 1989-90, co-operatives in AP contributed only 7 per cent of the total institutional credit given to IRDP beneficiaries; this should be a cause for concern.

The TRYSEM programme, in relation to its contribution to self-employment, does not present an encouraging picture [Hussain and Prakash 1988]. Its coverage is also small in relation to need and it is not well integrated with on-going development programmes. As of 1988-89 in AP less than 50 per cent of the youth trained were self-employed [Government of Andhra Pradesh 1990]. To strengthen the programme, better linkages in consultation with Agricultural University, Krishi Vigyan Kendras and voluntary organisations are necessary. There is a need to link up the programme more closely with the growth of the area.

A special programme for development of women and children, DWCR, was taken up in AP in the three districts of Adilabad, Cuddapah and Srikakulam as a sub-plan of IRDP in 1983-84. It was extended to two more districts in 1986-87 - Anantapur and Mahabubnagar. The objective of the programme is to focus attention on the women members of the target group with a view to increase their incomes through some organised economic activities and also to provide basic child care facilities for children of mothers at work. In addition, health care and nursing facilities of children at NREP worksites are also organised. This programme assumes that women can be organised into small groups with a nominated organiser from among themselves to act as a link person between the official machinery and the group.

An evaluation study [Rao and Vimala 1987] in Srikakulam, Cuddapah and Adilabad points out marketing problems, wrong selection of beneficiaries, and lack of technical know-how. In one case, i.e., candle making in Cuddapah, the group had to wait for the receipt of the raw material quota for more than one and half years. In the same district, the plastic and popcorn unit had to depend on the BDO for procurement of raw materials. Where linkages were established with purchase units, such as tribal welfare hostels in the case of dress making, as in Adilabad district, the units were relatively successful. Promotion of the banking habit through introduction of passbooks has been noted as a positive feature. Besides coordination of the programme with ICDS, and TRYSEM, and with SC and ST corporations for the building of child care centres, a need is felt to organise the groups in clusters of villages for effective functioning. An issue in credit was that banks were reluctant to advance loans to informal and unregistered groups as they were not considered legal entities.

INSTITUTIONAL CREDIT

The benefits from access to land and water and from additional assets cannot be adequately realised without access to institutional credit. There are three major means by which public intervention in improved access to institutional credit contributes to poverty alleviation. It enhances the incomes of the poor by reducing interest costs. Second, it enables the poor to improve their production through a shift to new technology and to high value crops requiring larger volumes of purchased inputs. Third, access to institutional credit reduces the dependence of the poor on moneylenders cum traders and landlords, leading to less reliance on the markets linking the credit market on the one hand, and labour, land and product markets on the other.

Public intervention in access to institutional credit for the poor has been assigned a critical role, particularly since bank nationalisation in 1969. There has been a rapid expansion of commercial banking in rural areas. Targets for commercial bank advances have been set for priority sectors. The responsibility for provision of credit to IRDP beneficiaries for development of their assets has been taken mainly by commercial banks.

Ghosh and Patel (1991), in a state-wise examination of access to institutional credit for marginal and small farmers, based on data provided by credit institution for 1986-87, show the AP position to be better than the all-India position for co-operatives, regional rural banks, and scheduled commercial banks. This is not however very comforting. What needs to be recognised is

that only one-fifth of the marginal and small farmers get farm credit from co-operatives; only 4 per cent from rural regional banks; and only 16 per cent from commercial banks. This shows that a much larger percentage of borrowers continue to be outside the purview of institutional credit. If account is taken of the possible down biases in reporting of holdings, the picture will be found to be much more discomfoting.

With regard to access to institutional credit for agricultural labour households, the debt and investment survey, NSS 37th Round, 1982, reveals a continued poor access of institutional credit for households with assets of less than Rs 10,000, to which most of the rural labour households belong. Institutional agencies accounted only for a small proportion of the total loans taken. The poorest among these did not benefit from the co-operatives. Commercial banks did a shade better in financing IRDP beneficiaries, but the bulk of the amount borrowed by the asset-poor was from landlords, agricultural moneylenders and professional moneylenders. These agencies accounted for more than 60 per cent of the cash outstanding of the poorest asset groups. In regard to the purpose for which money was borrowed, among those with less than Rs 10,000 of assets, poor households reporting 'household expenditure' formed a substantial proportion. This percentage showed an inverse relationship with the size of the asset per household. A substantial part of the amount borrowed, i.e. more than two-thirds, was on personal security and mainly short-term. Thus rural labour households show some unique aspects in relation to the credit market. The percentage borrowing is lower than among cultivators, and loans are taken mostly from non-institutional agencies and at higher rates of interest. Landlords and moneylenders are the major loaning agencies. The poorest continue to be the most disadvantaged in the credit market. In backward areas, the dependence of labour households on landlords for credit for consumption loans during seasons is found to affect their bargaining power in the labour market [Ramkrishana 1989]. In brief, public intervention in credit markets on behalf of the poorest continues to be more or less ineffective.

EMPLOYMENT AND MINIMUM WAGES

Employment programmes were implemented on a small scale until the beginning of 1980. They were expanded in the Sixth Plan period under the National Rural Employment Programme (NREP) and the Rural Landless Employment Generating Programme (RLEGP). These programmes were modified into Jawahar Rozgar Yojana (JRY) in 1989-90.

Quite a few studies on the implementation of employment programmes [Agro Economic Research Centre 1975, 1986b; Parthasarathy and Rao 1974; Ray and Rao 1990] have pointed out several deficiencies. Ray and Nageswara Rao's study (1990) and the Agro-Economic Centre's study (1986b) evaluated the NREP programme in Adilabad and East Godavari district respectively. The East Godavari district study pointed out the inappropriateness of the choice of projects, use of contractors, and imported labour; inappropriate timing; higher material costs; and unauthorised deductions by the engineering staff. The Adilabad district study drew attention to the inadequacy of NREP allocation to minor irrigation, conflicts between earmarking of funds and local needs, substandard quality of construction and lack of attention to the most useful species under the social forestry programme.

The shift from NREP to JRY contributed to interest among elected representatives and to more widespread participation. Not less than 80 per cent of the funds allocated in each district after setting apart 6 per cent for the Indira Awas Yojana (a housing programme for the poor and destitute among SCs and STs on a 100 per cent subsidy) are distributed among village panchayats in the district. The 20 per cent allocated to the district are to be utilised for various purposes including the 'Million Wells Scheme', a scheme to provide open irrigation wells free of cost to small and marginal farmers belonging to the SCs and STs below the poverty line. The JRY gave greater flexibility to village panchayats in the choice of projects.

As of 1989-90, the total resources utilised under JRY amounted to Rs 183 crore and employment generated was 71 million mandays [Government of AP 1990] – roughly seven mandays on the average for 10 million usually employed casual labourers. Assuming 45 days of unemployment under JRY in 1989-90, this covered 15 per cent of the unemployment. This should be considered a significant creation of additional employment.

JRY was, however, found to be inconsistent with the spirit of multi-level planning, and it starved inter-village projects of importance. Further, the special employment programmes had the potential to cover only 15 per cent of the total employed days. Besides, the programme needed improvement in two vital respects: it is not adequately related to agricultural development, and its location and timing needed improvement [Parthasarathy and Rao 1991].

Fixation of minimum wages is intended to protect agricultural labourers against exploitation in the labour market. Minimum wages for agricultural labour in AP have

been in force since 1961-62. They were revised with considerable lag in 1968-69, 1974-75, and in 1986. The minimum wage fixed in October 1986 varied among regions and among operations within regions. The minimum wage enacted in 1986 ranged from Rs 8.50 for the least skilled operation in least advanced region to Rs 15 for the most skilled/arduous operation in the most advanced region. The hours of work are fixed at six. Minimum wages are however inoperative for most operations because market wages are higher. For the operations, for which market wages are low such as weeding, minimum wages cannot be implemented without alternative avenues of employment. There is a need for identification of areas and seasons in which minimum wages are lower than market wages. In such areas, there needs to be concentration of alternative avenues of employment along with measures for effective operation of the implementation machinery and support to labour movement.

There has been a rising trend in real wages in the market wages since 1980s. This development is understandable in some coastal Andhra where agricultural growth rates have been consistently high both in the 1970s and the 1980s. But such trends are also reported for other regions in which rates of growth in the 1980s have been lower than the rate of growth of the labour force [Reddy 1991b]. In Telanagana, the Naxal movement and strong peasant movement are considered important in explaining the phenomenon. In other dry areas, a shift from low employment-intensive coarse cereals to high employment intensive oilseeds has assigned an important explanatory role. Declining participation in the hired labour market due to IRDP and increased demand for off-farm labour, translated into upward pressure in the daily market, are also cited as factors [Walker and Ryan 1990]. But growth continues to slide down, and sustainability of upward trends in real wages is in doubt.

Field surveys show lack of awareness of minimum wages, both on the part of the official machinery as well as on the part of labourers. Labourers are more concerned with ensuring that busy season wages do not fall, and disputes between labour and employers take place during peak periods rather than during slack periods. The requirements of both agricultural growth and rural harmony call for institutional mechanisms at the local level for quick settlement of disputes [Parthasarathy 1991].

BASIC NEEDS

Public interventions under this head cover housing, drinking water supply, nutrition and health, literacy and the public distribution system. The housing programme in

reas covers two types: (1) construction assistance to weaker section, and (2) housing for scheduled castes and scheduled tribes under Indira Awas Yojana with 100 per cent subsidy. The context of the programme changed radically since 1982-83. The hutting programmes for the rural poor which were in operation earlier gave place to pucca houses for the weaker sections [Centre for Planning and Development Studies 1982]. In the Seventh Plan, the outlay on rural housing was the highest among all the states – as much as 37 per cent of the total outlay of Rs 577 crore on rural housing in all-India was in Andhra Pradesh. Around 14 per cent of rural labour households and 20 per cent of SC households were provided with pucca housing by 1988. This was no mean achievement.

There is scope for closer integration with RDPI and TRYSEM and replacement of contractors by organised groups of labour for construction of houses. There is also a need for closer involvement of participants in the construction programme. A problem which is of concern to the state government is the low rate of loan recoveries from the beneficiaries of weaker section housing programmes.

Drinking water supply continues to be a problem, particularly in the dry and tribal villages. In the canal irrigated villages rural labour needs improved access to protected water supply. The maintenance of hand-pump tube wells leaves much to be desired. The performance of AP with regard to the social nutrition programme is found to be poor, not only absolutely but also in relation to all-India averages. Further, AP was the only state to introduce and quickly withdraw non-meal programmes, during the Sixth Plan.

The key issues of health policy relate to (1) health infrastructure, (2) primary health care, and (3) integration of the health system with the rest of the social system, including nutrition. There are gaps in the health infrastructure which need to be bridged if the targets in relation to health for 2000 AD are to be achieved. Effective and improved functioning of the ICDS is critical. A World Bank evaluation study in some districts of AP [Subba Rao 1987] showed that progress in immunisation and oral dehydration therapy (ORT) is critical for reduction of infant mortality. It commented on the current inadequacies of the ICDS: (1) relative failure to reach children below three years and pregnant and lactating women; (2) poor health and nutrition programmes; and (3) neglect of home visits and community participation.

The rates of literacy among the rural labour households in AP are often less than one-half of the levels among the self-employed within agriculture. This restricted the benefits they could get from the growth process and

from migration. The worst affected are female children among rural labour households [Chakravarthy 1989]. Extension of the school infrastructure has improved enrolment in recent years, but Operation Blackboard has not been effective. Teaching facilities leave much to be desired, and budgetary allocation to primary education has to be raised [Pulla Rao 1991]. Incentive systems in backward areas for enrolment for girls are needed.

Until 1983, as in most other parts of the country, public distribution of foodgrains did not cover the rural poor. But the two rupees a kilo scheme, a widespread and popular programme directed to the rural poor introduced by the Telugu Desam government in 1983, made for a difference. Since the public distribution of foodgrain in AP is considered the most successful public intervention programme both in terms of coverage and benefits to the poor, it is discussed in detail below.

SOCIAL SECURITY FOR RURAL POOR

In Andhra Pradesh, destitute persons aged 65 and above who have no means of livelihood, and physically handicapped persons, are eligible for pensions. Further, landless agricultural labourers who are aged 60 and above and who have no means of livelihood are granted pensions at Rs 30 per month. Since 1985-86, relief has been given to pregnant and lactating agricultural labour women to enable them to take nutritious food. An amount of Rs 40 per month in ICDS areas and Rs 20 per month in other areas for the first two births, before and one month after delivery, is given to each beneficiary.

The expenditure on the programme of old age pensions for agricultural labourers was Rs 3.58 crore in 1986-87; and the number of beneficiaries was 83,333. Under the old age pension scheme for destitutes aged 65 and above, the amount spent was only Rs 0.23 crore in 1987-88, and the number of beneficiaries, 6,525. Under the scheme for pregnant and lactating agricultural labour women in 1987-88, the expenditure incurred was Rs 0.34 lakh benefiting 28,300 women. Undoubtedly, the allocations under social security are meagre.

The plan progress reports for AP show that in quite a few years the expenditure on these schemes fell below the budgeted amounts. Enquiries in villages show that there were quite a few eligible persons in each village under the scheme, around 10 or so, but the benefits received by them are irregular and many of those eligible do not get benefits. There is a need to review the working of the social security schemes and to design a comprehensive scheme of social security covering rural labour on the lines of Kerala act

III

Two Rupees a Kilo Scheme

The significance of food security for the rural poor through an efficient public distribution system needs to be understood in the context of growing market dependence in rural AP. Of the total households in 1987-88, 46 per cent were labour households; roughly half of them were landless, totally dependent upon the market for foodgrains, and the other half were marginal farmers, mostly with less than 0.40 ha, who also depend on the market for a major part of the year. Some of them sell immediately after the harvest to meet their cash obligations and later must purchase their foodgrain requirements from the market. Market dependence has also been growing with a shift from regular employment to casual labour and rapid changes in the mode of wage payment from kind to cash. Further, small and marginal cultivators in low productivity drought prone regions of Rayalaseema and in tank irrigated regions are net buyers of foodgrains. Given such developments, the pressure for a public distribution system in rural AP could be expected to be stronger than in many other states of India.

Distribution of foodgrains through fair price shops in rural and urban areas together was only 3.16 lakh tonnes even as late as 1977. This was much less than what was obtaining in most of the major states, and only around one-third of the off-take in Tamilnadu [Bapna 1990:114]. No separate details were available for rural areas. In 1978 government supplies as a ratio of domestic consumption of rice worked out to be only 1.22 per cent.

The public distribution system has changed both qualitatively and quantitatively in AP since 1983 with the introduction of the 'two rupees a kilo scheme'. Under the scheme families having an income of Rs 6,000 and below per annum, having up to 1.5 acres of wet land under assured water sources, 2.5 acres of wet land under other irrigation source like tanks, wells, etc., three acres of dry land under commercial crops, and five acres of land under other crops, were given green cards. Green card holders are eligible to draw five kg of rice per capita per month, subject to a maximum of 25 kg per household per month, from the fair price shops. The non-poor are given yellow cards and they are not eligible for rice. The total off-take of foodgrain from the central pool rose from 6.26 lakh tonnes in 1983 to 18.40 lakh tonnes in 1986. The off-take in Andhra Pradesh in 1986 was only slightly less than in Kerala and Maharashtra. There has been extensive coverage of rural areas under the public distribution system and rural fair price shops accounted for four-fifths of the total shops.

YEARS OF BANKING EXPERIENCE!

(SO, IS IT ANY WONDER THAT OUR BANKING IS SO STABLE ?)

12th March, 1906. It was the day when Corporation Bank was born, with the Founder President, Khan Bahadur Haji Abdullah Haji Kasim Saheb Bahadur, setting the vision:

"THE PRIMARY OBJECT IN FORMING THE 'CORPORATION' IS NOT ONLY TO CULTIVATE THE HABITS OF THRIFT AMONG ALL CLASSES OF PEOPLE, WITHOUT DISTINCTION OF CASTE OR RELIGION, BUT ALSO HABITS OF CO-OPERATION AMONG ALL CLASSES. THIS IS 'SWADESHISM', PURE AND SIMPLE, AND EVERY LOVER OF THE COUNTRY IS EXPECTED TO COME FORWARD AND CO-OPERATE IN ACHIEVING THE END IN VIEW. ALL POSSIBLE GUARANTEE IS OFFERED BY THE RULES FOR THE SAFETY OF THE FUNDS AND THEIR GOOD INVESTMENT."

In today's liberalised environment, we've remained unaffected by the upheavals in the banking industry. Thanks to our upholding the basic

values instilled by our Founder President, all along. Proof of our stability lies in the fact that our NPA ratio is the lowest. We've also been able to meet the Capital Adequacy Standard and fully comply with the prudential accounting Standards and provisioning norms. Thereby guaranteeing the safety of our depositors' funds.

As we enter the 90th year of our glorious existence, we have a mission to fulfil. To meet the growing aspirations of the customers of the bank in the changing competitive environment and bring about total customer satisfaction by delivering quality service in a cost effective manner through contribution by all. To fulfil national and social priorities as a public sector bank. To post a satisfactory return on equity investment through Sustained Profitable Growth.

Our Strategic Intent. To be a leaner, resilient, vibrant and dynamic organisation

standing out in the comity of banks. To be a viable growing bank, committed to bringing about innovation in services, mirroring customer needs. To carve out niches in 'service' and 'client segment'.

In the 90th year, our 9000 strong committed employees have set a goal of Rs. 9000 crores of business.

For us, the future is an exciting challenge.

Corporation Bank

THE 90 YEAR YOUNG BANK

HEAD OFFICE POST BOX NO. 88, MANGALORE 575 001

As per the CESS study [Radhakrishana and Indrakanth 1987] there were 8.03 million green card holders in 1985 in rural areas covering 27,221 villages. Greencard holders in rural areas formed 80 per cent of the total. The total requirement of rice to be supplied through the public distribution system in AP was nearly 20 lakh tonnes per annum in 1984-85. Against this requirement one half was available from the central pool and the other half was purchased by the AP Civil Supplies Corporation (APCSC) from millers at negotiated prices. On account of the scheme in addition to the expenditure incurred by FCI in providing subsidised rice, the state government spent Rs 1,317 million in 1985-86 towards subsidy and administrative costs. The cost to the state government towards subsidy rose sharply in 1989-90. In 1990-91 the subsidy was Rs 1,685 million and the anticipated subsidy in 1991-92 was Rs 5,360 million, around 10 per cent of the total expenditure in the revenue account and 11 per cent of the state's tax and non tax receipts.

DELIVERY SYSTEM

The rice allocated by the central government and the rice procured by the AP State Civil Supplies Corporation are received from the respective godowns and transported to the mandal level stockist points (MLS point). The stockist points are set up at convenient places so that stocks are moved at the least possible transportation cost. The stockist points are run by the State Civil Supplies Corporation except in Gijana areas. From the MLS point the rice again is transported to the fair price shops and other notified dealers for ultimate distribution to the card holders.

The shop to green card ratio is 1:403 [Dayachari 1990]. Each mandal is divided into routes for the transportation of essential commodities and each route is assigned to either a revenue inspector or a deputy tehsildar. These route officers are responsible for collecting demand drafts for the value of the stocks and handing them over to the deputy tehsildar (DS) at the stockist point. On receipt of these demand drafts, the civil supplies tehsildar, based on the allotment given by the mandal revenue officer, issues release orders and also makes arrangements for transport of the stock. Where there are operational godowns of the State Civil Supplies Corporation, the stocks of rice are directly moved to the fair price shops without the mediation of a stockist. Immediately on receipt of the stocks at the fair price shop, as per the rules, the fact should be made known to the card holders by tom. The consumers are free to lift their ration in a single instalment for a month. They are also permitted to lift up to five instalments in a month.

To assist the operation of the public distribution system food advisory committees are constituted at various levels viz state, district, mandal, gram panchayat etc. with officers of the civil supplies department acting as convenors. Representation is sought to be provided to all recognised political parties on these committees. The committees are expected to review the functioning of mandal stockists/fair price shops, issue of green cards etc. They are expected to bring to the notice of the officers any deficiencies in the system. The tenure of the committees is one year. The state, district and corporation committees are expected to meet once in a quarter, the mandal, panchayat and municipality committees are expected to meet once a month. But there is little documented evidence on the functioning of these committees. Discussion with the officials of the Civil Supplies Corporation show that the corporation has no system of monitoring the functioning of the committees.

IMPACT

The impact of the two rupees per kg rice scheme on the poor depends upon a number of factors: the extent of quota availed, the share of subsidised foodgrain in the total consumption of foodgrains, the price of rice in the open market and the extent to which the open market price differs from what it would be in the absence of intervention. On some of these, some light could be thrown from the results of a sample survey cited by Dayachari (1990). Out of 1,36,156 cards verified, about 1,522 cards were not with the owners, but were either with fair price shop dealers or with somebody else. In 356 cases, the cards were pledged and 6,237 card holders lifted their stocks partly out of quota. Of the remaining 9,115 card holders had lifted their stocks partly and 81,468 card holders (59.8 per cent) had drawn their rice from the fair price shop in full. Notwithstanding such leakages, the benefits to the rural poor from the two rupees a kg scheme are significant. Though a large percentage of non-poor are included, only a small percentage of poor even in rural areas are outside the purview of the green card system. This accounts for the appeal of this programme. Other gains, such as the improvement of the bargaining power of labourers in the labour market, are also attributed to the public distribution system.

There is also a view that the gains are dissipated because of increasing alcoholism among the poor, but there is little documented evidence for this. There is a further confirmation of the high degree of participation of the rural poor in PDS from the data presented in the NSS 42nd round, 1986-87 [Government of India 1991]. Among the bottom 40 per cent of the rural

poor, rice purchases from the public distribution system in the total purchase of rice varied between 36 and 49 per cent. The dependence of the rural poor on the public distribution system was also found to be large. The position in AP is seen to be better than the corresponding position in all India.

Radhakrishana and Indrakant (1987) estimated for 1985-86 through an econometric model the effects of alternative food policies on welfare levels of different strata of rural and urban population. The policies considered include (i) procurement and public distribution and free exports of rice to other states without any restriction, (ii) withdrawal from procurement and public distribution of rice and removal of all restrictions on import and export, (iii) functioning of the market under autarchy and policy of self-sufficiency and (iv) FCI makes available through additional procurement the entire requirement of the green card scheme and the distribution under two rupees a kilo scheme continues on an expanded scale and covers also the middle class. The findings of their econometric exercise lend support to the procurement public distribution system and the two rupees a kilo scheme as compared to a liberalisation policy on welfare grounds. Sastry, Hanumantha Rao and Narsinga Rao (1990) in a study in the drought-prone Rayalaseema area as part of the NSS 44th round, state sample in 1988-89 show that about 78 per cent of poor households were subsidy rice users and each user got 19.5 kgs of rice from the system although non-target groups were also enjoying the benefits of rice subsidy. The leakage of benefits to non-target groups in terms of households worked out to 24 per cent and in terms of quantity 21 per cent. However, the leakages were noted to be not very high compared to other types of redistribution programmes like IRDP. The results show that (1) per capita consumption expenditure of subsidy users on coarse cereals was around 40 per cent of the level of non-users, (2) rice consumption expenditure was 1.3 times, (3) total consumption expenditure on cereals was almost the same for both groups, (4) the quantity of total cereal consumption was higher for the subsidy users, (5) the subsidy user gained 14 paise benefit per capita through subsidy out of every marginal rupee spent and (6) there were no welfare losses due to unwarranted shifts in consumer behaviour because of the subsidy scheme and there is no statistically significant difference in user and non-user consumption behaviour.

PRICES AND LEAKAGES

The open market prices for rice have increased at a fast rate since the scheme was introduced. The average wholesale price of rice II sort in AP per quintal increased from

Rs 261.29 in 1984-85 to Rs 377.85 in 1989-90, i.e. at a compound rate of 7.7 per cent per annum. Current prices of rice are almost double that of 1989-90. Given these price trends in the open market, the gains from subsidised rice increase at an accelerated rate. A green card turns into a treasured piece and the temptation for those who are considered non-poor, to obtain green cards is great. Bogus cards increase in numbers, and green card holders are roughly double the numbers of rural poor. The system becomes unsustainable without some control over the open market prices of rice.

The system also becomes non-sustainable with increasing issue prices and increasing subsidy. The subsidy per kg, i.e. the difference between the issue price of FCI plus the trading costs of the system on one hand, and the price charged for the green card holder per kg of rice, has risen approximately from Rs 0.38 in 1984 to Rs 1.67 in June 1990, i.e. the subsidy per kg has risen by 4.39 times. This has put enormous strain on state resources. Currently expenditure on the subsidy forms around 11 per cent of the total tax and non-tax revenue of the state government, and thereby reduces the availability of resources for infrastructure such as irrigation and electricity.

CRITIQUE OF GREEN CARD SYSTEM

To meet the requirements of the green card system, the State Civil Supplies Corporation enters into negotiation with the millers. It pays them a price higher than the procurement price of FCI. In addition, the millers are allowed free exports to other states. While the first increases the subsidy, the second reduces the supply available at open market rates and has the effect of increasing open market prices. One cannot say with certainty what would have been the effect of open market prices in the absence of state intervention for the purpose of the public distribution system. But there is a possibility that given reduced exported supplies as a consequence of export allowance to millers, the open market prices in the state could be higher than what they would be in the absence of export permits. For this reason, the gains to the poor are partly offset by the rise in open market prices.

A second important consideration is the impact of the rising subsidies. With the increase in issue price of the FCI and the inability of the state to spend large amounts on investments in employment generating and foodgrain increasing projects could decline. There is also a third consideration which needs attention. The levy on the millers for the purpose of the public distribution system, it is said, results in postponement of purchases

by millers and in lower prices for small producers in the harvest season. The small farmers are likely to be affected by this.

The system does not cover cereals, the staple diet of the poorest in the dry regions. It also needs a sharper targeting. Though the poor form only 40 per cent as many as 80 per cent hold green cards. The income criterion, which is hard to implement in the rural context, needs to be given up in favour of other criteria. The price for green card holder needs to be related to the issue price of the FCI if unbearable burdens on the state are to be reduced. Moreover the cost of administration is found to be too high and this needs to be reduced.

The magic figure of two rupees and the magic colour green were finally given up and the price was raised from Rs 2 (1990) to be precise which has been operative since November 1990) to Rs 3.50 with effect from January 18, 1992. The magic colour green will be replaced by white. The quantity for which the poor are eligible was reduced to four kg per capita per month subject to a maximum of 16 kg per card per month.

IV

Growth versus Public Intervention

A precise estimate of benefits actually received by poor households from the foregoing expenditure is hard to get. As noted earlier, there were considerable leakages in all programmes to the non-poor and not all assets created under IRDP were with the poor. We assume that only 50 per cent of the assets are under the possession of beneficiaries and that the asset gives a return of 10 per cent per annum. On this assumption, the annual income for rural poor households from IRDP is around Rs 50 crore. The expenditure on the employment programme was on the average Rs 139 crore per annum. Assuming 60 per cent was spent on labour, the benefits to labour were Rs 83 crore. We assume the leakages to be of the order of 30 per cent, far less than in IRDP. On this assumption, the benefits to the rural poor were 58 crore per annum from employment programmes. We accounted for the leakages in arriving at the benefits from public distribution and no downward adjustments are needed. We assume housing construction provided employment benefits of the order of 20 per cent, or eight crore. Thus, the total benefits for poor households per annum during the Seventh Plan period were

	(Rs in crore)
IRDP	50
Employment	58
EDS	47
Housing	8
Social Security	4
	<hr/> 167

The per capita benefits per annum for the rural poor in the Seventh Plan period Rs 7.75 per month. The per capita income of the rural poor in 1987-88 was Rs 85. The per capita income of the rural poor would have been less by 9.0 per cent in the absence of public intervention. However, the sustainability of reduction in rural poverty is in doubt as is suggested by the higher annualising rate of growth of poverty in urban areas, possibly due to the migration of rural poor into urban slums (Parthasarathy 1991). A further factor is the context of declining elasticity of employment to output. An important aspect of the changing profile of rural poverty noted in our study is its growing concentration in regions with poor resource endowments and among agricultural labourers. Such areas are marked by low levels and poor quality of irrigation. There is a need to integrate more closely the employment programmes with the development of irrigation and the efficient use of its water.

Despite a large coverage of the order of 60 per cent of the beneficiaries, sustained benefits from IRDP have been of a low order. Yet the plea for total withdrawal of IRDP and its substitution by NREP is defeatist and misleading. Continuing unequal distribution of land and other assets in rural areas results in wide inequalities in benefit. Employment programmes, however effective, cannot correct these inequalities. Further, there has been little absorption of the landless and land-poor in the urban industrial sector even while the surplus of rich and middle farmers get shifted outside the rural sector. Under these circumstances, IRDP has a role in obtaining a better share in the new assets created in the rural sector, especially in allied occupations such as dairy, poultry, sericulture, pisciculture and horticulture for the land-poor groups and in easing the pressure on the hired labour market. Allied occupations expand new opportunities are created in service occupations. What is required again is a closer co-ordination of IRDP programmes with remunerative development opportunities in these areas.

The transaction costs of serving credit in small amounts and to small peasants as well as the risk premia are higher than for medium and rich peasants. Hence an element of interest subsidy to the institution for operating a second window for the small and the poor becomes inevitable, even when the bank charges a uniform price on capital for all. But a capital subsidy, a source of politisation of bank lending, has resulted in distortion of use of resources, and has been leading to corruption in the implementation agency. This needs to be given up also for the reason that the pressure built for a capital subsidy has been eroding the authority and responsibility of the bank. In the place

of capital subsidy to the individual, an interest rebate to protect the poor during their early relations with the banking system, and which would decline to zero with repeat borrowing over a period of time are considered a preferred means [Pulla Rao 1991].

AP's public distribution system in rural areas has been most popular, yet it has suffered on several counts: (1) It covered the large majority of the poor, within rural areas no doubt, but it could not exclude the non-poor from its purview. In the Seventh Plan period, only one-fourth of the benefits accrued to the poor. Repeated efforts to eliminate bogus cards did not bear fruit. Sharper targeting continues to be an issue. (2) The rising subsidies at a fixed supply price have put enormous strain on resources; it is reported that expenditure on irrigation and power was not at the desired level because of the rising cost on public distribution. This again suggests a need for sharper targeting. (3) If improved nutrition is the objective, trends in cereal consumption among subsidy users do not show that this is being achieved. Nutrition programmes directed to vulnerable sections should supplement a better targeted public distribution programme.

LAND REFORMS: A DEAD ISSUE

The spread of naxalism in AP has brought the issue of land reforms back to the fore [Parthasarathy 1992]. The intensity of the movement is the strongest in the tribal areas. In these, the failure of the implementation of land alienation laws, coupled with declining access to forest produce, have marginalised large sections of the tribals. Effective implementation of alienation laws and improved access to forests are a must to curb social unrest, and removal of the conditions leading to social unrest is the most urgently needed public intervention.

Thanks to the spread of naxalism, landlords who possess land in excess of the ceiling land, absentee landowners, and landowners in illegal occupation of government waste lands, are identified and their lands forcibly occupied. In some areas, big landowners are terrorised into fleeing to cities. These conditions are neither conducive to growth nor to poverty alleviation. Even those who hate the mindless violence of naxalites and their philosophy of individual annihilation, cannot disregard the fact that naxalite are seeking to implement what the state professes and has failed to do. The conditions for the growth of naxalism are rooted in the failure of implementation of land reforms. In these situations, effective implementation of land reforms becomes a necessary public intervention for poverty alleviation, as well as for participation of

people in the development process [Parthasarathy 1992].

In Andhra region, especially south coastal Andhra where levels of irrigation and infrastructure development were higher, the green revolution induced the development of capitalist agriculture in place of a rentier agriculture. This promoted growth as well as reduction in poverty. However, in recent years contradictory trends are in evidence. There is a revival of absentee landlordism and rise in tenancy on a large scale as the big landowners shift their surpluses and even their residences to urban areas. There are also shifts to other enterprises within agriculture such as pisciculture and agro-forestry which reduce the elasticity of employment to output and also the rate of growth of foodgrain production. Both these trends are likely to affect the sustainability of reduction in poverty unless the rate of absorption of labour in non-agriculture rises at a very high rate, which does not appear feasible. The experience in the deltas suggests that the progress of capitalism within agriculture cannot but be uneven and halting, given the large number of landless and land poor. Land reform measures to protect the rights of poor tenants and to promote access to land for the landless through acquisition of the land of the absentees, could help equity and growth. But these implementation is possible only with the effective involvement of the intended beneficiary groups.

AP is seen to lag behind all other southern states in indicators of human resource development. The links between human resource development, particularly development of women, and reduction in fertility rate are seen to be very close. Literacy of women results in better child care, reduces infant mortality, and contributes to reduction in the fertility rate. Low literacy rates are the accumulated result of poor enrolments, higher drop-out rates and in brief a failure to achieve universal elementary education. Areas with high drop-out rates need to be identified, and in these areas incentives will have to be given to lower the drop-out rates.

Similarly, a whole range of new skills need to be promoted to support the newly emerging occupations allied to agriculture. Vocational education which meets the new needs will have to be built into the curricula of institutions in rural areas, both as an integral part of formal education as well as well-conceived short-term non-formal training for youth who are occupied in these enterprises. The experience of Japan in the promotion of technical education in agriculture, and its linkages with reduction in poverty, have useful lessons to offer [Hirashima 1991]. This implies that there should be much more

investment in elementary and vocational education in rural areas than what was done in the past.

PUBLIC ACTION

Finally, we would like to argue along with Dreze and Sen (1989:279) that public participation, collaborative and adversarial, in eradicating deprivation is important. The public should be seen not merely as the patient whose well-being commands attention, but also as the agent whose action can transform society. Taking note of this dual role is central to the understanding of the challenge of public action against deprivation. In the light of such an understanding, we consider that while the recent moves in AP, towards a more effective decentralised panchayat raj are in the right direction, the acts of repression in Telangana rural communities, even if for the ostensible purpose of law and order constitute a threat to the progress of public action, understood in its wider sense.

Notes

[This paper was prepared during while the author was visiting professor at NIRD, Rajendranagar, Hyderabad. The author is thankful to T Haque, Director, Centre for Agrarian Studies, NIRD, for the excellent facilities.]

- 1 Radhakrishna's cross-sectional analysis (1986) showed that while agricultural growth reduced rural poverty, proletarianisation increased it. But in the 1980s the rate of agricultural growth was lower, levels of proletarianisation higher, and yet poverty continued to decline.
- 2 Based on socio-economic survey conducted by the backward classes welfare department of the state government in 1983.
- 3 Compound growth rates of foodgrain production were 1958-59 to 1967-68 (pre-Green Revolution period) = 0.68 per cent per annum, 1967-68 to 1976-77 (post-Green Revolution period, I Phase) = 3.67 per cent per annum, and 1976-77 to 1988-89 (post-Green Revolution period, II Phase) = 2.16 per cent per annum.
- 4 The rise in the incidence of urban poverty between 1983 and 1987-88 is noted only in the estimates of Minhas et al (1991) and not in other estimates, and therefore calls for closer scrutiny.

Political Economy of Poverty in Bihar

Alakh N Sharma

The acute poverty situation of Bihar can be traced to the economic backwardness of both the agricultural and industrial sectors. While natural or technological factors such as floods, poor development of infrastructure and high population density play their part, the state's backwardness is related more to the inequitous and exploitative socio-economic structure, lack of political leadership and almost total collapse of the administrative and law and order machinery – to the point where it is said that in Bihar the state has withered away. These conditions have created a milieu of non-development in which even large scale poverty eradication programmes have had little impact. The only ray of hope is the increasing awareness and mobilisation of the rural poor whose potential can be harnessed to improve the management of such schemes and to pressurise the state into making structural changes.

I

Socio-Economic and Demographic Characteristics

BIHAR, the second most populous state of India (comprising a little more than 10 per cent of the country's population) is economically the most backward. Along with a very high proportion of population below the poverty line (40.7 per cent in 1987-88), Bihar has the lowest per capita income among all the states of India – its per capita income (net GDP at factor cost at current prices) stands at a mere Rs 2,904 as against Rs 5,781 for India as a whole and Rs 9,643 for Punjab (CMIE 1994 Table 10.2). The state has the lowest literacy rate among the major states of India – 38.5 per cent as against the national average of 52 per cent and Kerala's rate of 61 per cent. It has a very high child mortality rate and also fares very badly with respect to most of the other socio-economic indicators of development.

This acute poverty and backwardness can be traced to the backwardness of both its agricultural and industrial sectors. Among the major states of India it has the lowest per capita (rural) income (net value added from agriculture) – Rs 948 (average of 1987-88 to 1989-90) as against Rs 1,522 for India as a whole and Rs 3,929 for Punjab (CMIE 1994 Table 7.2). The reasons for the extreme backwardness of agriculture are both institutional and technological. Whereas structural and institutional factors have been operating as a powerful barrier to the agrarian transformation, the technological factors such as poor development of infrastructure like irrigation and power, non-availability of modern inputs, low volume of credit and poor extension services, etc. have also contributed much to the dismal performance of the state's agricultural sector.¹ Though some big industries, mostly in the public sector, are located in Bihar, the sluggish rate of growth in agriculture did not produce the spread effects of these industries, and hence industrially also the state continues to be backward, even though it possesses about one-fourth of the mineral resources of the

country. Per capita net value added in the manufacturing factory sector in Bihar was only Rs 305 in 1989-90 (at current prices) as against Rs 514 for India as a whole and as high as Rs 1,266 for Maharashtra (CMIE 1994 Table 8.7). The major explanation of the state's backwardness and poverty, however, has to be traced to the rural sector. With about 87 per cent of the population in rural areas (as against 74.3 per cent for India as a whole), it is the most rural state in the country, next only to Assam. Further, about 46 per cent of the state income (average of 1986-87 to 1988-89) is derived from agriculture (and allied activities) as against about 34 per cent for India as a whole and about 23 per cent for Maharashtra and Tamil Nadu.

Floods in large parts of the plains of Bihar, especially in north Bihar, are recurring features and cause havoc, destroying crops and the quality of land, and threatening the conditions of life and livestock due to large-scale displacement. Few flood control measures have been effectively implemented. Some of the districts in the south Bihar plains and plateau region are drought-prone with poor irrigation facilities. Though the overall percentage of net area irrigated in Bihar is about 38, irrigation is largely seasonal and protective. Waterlogging in substantial parts of the command area of north Bihar is a chronic problem.

One of the obvious reasons for the economic backwardness and poverty of Bihar is its high density of population (497 persons per sq km in 1991), the third highest in the country after West Bengal and Kerala. The average per capita operational holding in the state is 0.87 hectare (in 1985-86) as against 1.7 hectare for India as a whole and about 2.8 hectares for Punjab. About three-fourths of the operational holdings are marginal (less than one hectare) in which the average size is merely 0.31 hectare. But the population pressure on land in the region is not as acute as the population density would indicate. In contrast to some other poverty-stricken and backward regions of the country, such as parts of central India where the natural

productivity of agricultural land is very low, Bihar has a large alluvial river valley area. Moreover, the plateau region in the southern part of the state is extremely rich in minerals. In view of such generous natural resource endowment, it seems that the state's backwardness is probably more related to its socio-economic, political structures, unresponsive political leadership, and the nature of development strategies that the state has pursued so far. Apart from the exploitative social and agrarian structure, Bihar is also experiencing an acute crisis of political leadership, bureaucratic inefficiency, rampant corruption at all levels, and social disorder. The almost total collapse of the administrative machinery – once hailed by the British cabinet secretary in the Appleby report even after independence as the best organised in India – is matched by the calamitous condition of the educational institutions (Das 1993: 79). There have been no panchayat elections for more than two decades. The division of society into castes has penetrated not only into politics but also into the bureaucracy, academics and other professions, seriously affecting the efficiency and functioning of the entire system of governance, development machinery and other sectors. Caste tensions, and in some parts of the state even caste riots, have seriously eroded social harmony. The serious breakdown of the law and order machinery and the scenario of crimes, kidnapping, tensions and violence have prompted people to sarcastically remark that the state has withered away in Bihar.

These conditions have created to an extent a socio-economic milieu of non-development. The era of planned economic development in the state has hardly cared for the masses, but only for organised sector workers, particularly the government/semi-government employees, while the elites, including professionals, contractors, politicians and power brokers, have fattened themselves in the 'development' process. The prevailing socio-economic situation is so alarming that it is being described as the 'state without hope' and the 'graveyard of

development projects that achieve success elsewhere'. In the wake of widespread poverty, a substantial number of poor people go outside the state in search of livelihood. In several parts of the state, the poor have become restive – in central Bihar poor peasant and agricultural labourers have launched a powerful movement against their oppression. Thus, Bihar is not only poor and economically backward but is also a state where institutional barriers of all types – socio-economic, political, cultural, etc – are quite strong. A sympathiser of the cause of Bihar even goes to the extent of saying that "the state is not only suffering from culture of poverty, but also from poverty of culture".

GEOGRAPHICAL/ECONOMIC UNITS

Before we proceed to discuss the extent and profile of poverty, we should remember that the state is far from homogeneous with regard to the distribution of its natural resources and growth patterns. It is divided into two distinct topographical units – the plains and the plateau. The plains region, which is almost flat and alluvial, slopes gently toward the east. This region is divided by the river Ganga into two unequal parts – north Bihar plains and south Bihar plains.

North Bihar plain is very fertile and constitutes about 31 per cent of the area of the state. It has a number of big rivers and is afflicted occasionally by heavy floods, causing huge damage to crops and property. The area is heavily populated – the density of population in this region is one of the highest in the country. The area is predominantly rural, the urban population being only about 6 per cent. In recent decades, a few islands of industrial growth such as the Barauni complex have come up; otherwise, the economy lacks diversification. The infrastructural facilities are extremely meagre. Large disparities in irrigation, power consumption, rail and road communications, etc, persist *vis-a-vis* the other regions of the state. It is no wonder, therefore, that north Bihar is an area of endemic poverty, backwardness and unemployment. Consequently, this region sends a large number of migrant labourers from its rural areas to places such as Punjab, Haryana and Delhi.

The south Bihar plains, constituting 21 per cent of the total area, is not subject to frequent floods, except for lands on the banks of rivers. This region is more diverse than the north Bihar plains. It has the lowest rainfall of the three regions. It is considerably more urbanised than the northern plains, the level of urbanisation being about 15 per cent. The position in regard to infrastructure is also better. Though it is comparatively more industrialised than north Bihar, the level is still quite low. A large part of the rural area of this region is currently witnessing

the radical peasant and labour movement leading to considerable violence and turmoil.

The Chhotanagpur plateau region has undulating topography and does not suffer from floods and drought to the extent of other parts of Bihar. But its land is not fertile and barely 30 per cent of the total land is used for crop production, as compared to 50 per cent in the state as a whole. Forests account for 29.2 per cent of the total area. Poorly served by irrigation (about 10 per cent) its agriculture is carried out almost entirely under rain-fed conditions. The plateau, however, is richly endowed with natural resources. Almost 90 per cent of the minerals found in Bihar are located in this region and have given rise to a number of mines and metal based industries. The level of urbanisation in the region is 20.3 per cent – much higher than the two other regions. This area also has a high concentration of scheduled tribes, as much as 92 per cent of the state's 6.6 million scheduled tribes. On the other hand, the scheduled castes, although found in sizable numbers everywhere, are generally concentrated in north Bihar which has about 60 per cent of the scheduled caste population of the state. Though there has been development of industries in the plateau region, the conditions of the local tribals have not improved appreciably. They feel alienated due to a number of factors – cultural, economic and social. Consequently this region is presently facing a somewhat powerful movement by tribals to separate this region from Bihar and create a new state known as 'Jharkhand'.

II

Poverty in Bihar

Bihar is among the states in India where the incidence of poverty is most acute. According to official estimates the state had the highest incidence of poverty in 1983-84, with half of its population below the poverty line. In 1987-88 about two-fifths of the state's population was below poverty line, which, except for Orissa, was the highest in the country. Some unofficial estimates, however, point to an even higher incidence of poverty in the state. In one such estimate by Minhas, Jain and Tendulkar (1991), it was reported to be as high as 65 per cent in 1987-88. In this estimate, the state had not only the highest proportion of population below the poverty line among all the states (including Orissa), but it had shown practically no sign of decline till 1983-84. Even after 1983-84 the decline was higher elsewhere in India than in Bihar. As revealed in Table I, during the period 1957-58 to 1973-74 the percentage of rural population below the poverty line in India declined from 53.4 to 47.6, but in Bihar the decline was almost negligible – from 59.7 to 58.4.

During the century's worst drought in Bihar in 1966-67, the calorie consumption of about three-fourths of the rural population was below the normative minimum. During 1977-84, while the rural population in poverty decreased by 10.8 percentage points in India, the corresponding decrease was only 6.4 percentage points in Bihar. However, during the period 1983-84 and 1987-88 the decline in poverty in Bihar, as per official estimates, was comparable to the all India estimates – 8.7 percent to 7.0, respectively. This relatively better performance of Bihar has put the state in second place (after Orissa) now with regard to the incidence of poverty.

There are several factors behind the recent decrease in poverty level in the state. First, the growth of agricultural output has been relatively better since the mid-1980s, largely due to better weather conditions and to some extent to an increase in the use of modern inputs. Second, remittances from migrant working outside the state, which have become quite significant, have contributed to increased consumption expenditure as well as investment in cultivation. Third, various poverty alleviation programmes, notably IRDP, NREP and RLEGP, have had their albeit small – share in this development.

UNEMPLOYMENT

Contrary to the high incidence of poverty the unemployment rate as per time criterion is quite low in the state. According to the 43rd NSS round of 1987-88, the unemployment rate as per usual status in rural areas of Bihar was 2.6 per cent for males and 0.8 for females; the corresponding all India rates being 2.8 and 3.5 per cent respectively. Several states (i.e., Assam, Haryana, Kerala, Tamil Nadu, West Bengal)

TABLE I: PERCENTAGE OF RURAL POPULATION IN POVERTY IN INDIA AND BIHAR

Years	India	Bihar
1957-58	53.4	59.7
1959-60	48.7	55.7
1960-61	42.0	41.5
1961-62	42.3	49.9
1963-64	49.1	52.1
1961-62	42.3	49.9
1963-64	49.1	52.1
1964-65	50.4	54.2
1965-66	51.1	59.4
1966-67	57.4	74.4
1967-68	57.9	70.9
1968-69	53.5	59.4
1970-71	49.1	59.0
1973-74	47.6	58.4
1977-78	* 51.2	57.8
1983-84	* 40.4	51.3
1987-88	* 33.4	42.7

* Not strictly comparable to earlier series.
Sources: Ahluwalia (1978) up to 1973-74 and CMIE (1994) for 1977-78, 1983-84 and 1987-88.

and a few others) had higher unemployment rates than Bihar. However, the underemployment rates among both males and females, of 14.6 and 12.3 per cent respectively in 1987-88, were the second highest in the country after Tamil Nadu – much higher than the all India rates of 9.8 and 6.0 for males and females respectively [Ministry of Labour 1991:47]. Thus, though people in rural areas are not openly unemployed, due to their poverty they do not find regular productive employment over the year, which prompts large numbers to migrate to other regions in search of livelihood. The state reports high year-to-year fluctuations in the availability of employment opportunities, thanks to floods and droughts. Thus Bihar suffers from a low productivity employment problem in the key agricultural sector rather than an unemployment as usually measured in terms of person-days. The incidence of poverty among a large section of self-employed cultivators belonging to marginal and small land categories is so high² that they will join the category of paid workers, leaving their farms work, if suitable work opportunities are offered to them.

Table 2 shows a retrogression in the employment structure in the state. The share of the primary sector has gone up from 80.23 per cent in 1961 to 82.36 per cent in 1991. The share of the secondary sector declined sharply from 8.28 per cent in 1961 to 4.64 per cent in 1991. In fact, as shown in Table 2, even the absolute numbers employed in this sector decreased from 15.72 lakh in 1961 to 11.88 lakh in 1991. Bihar has a low percentage of workers engaged in rural non-farm activities – 20 per cent in 1987-88 compared to 46 per cent for states like Kerala. Further, in India as a whole rural non-farm employment has significantly expanded during the 1970s and 1980s. However, Bihar one of the few states where the expansion has been extremely low – between 1983 and 1987-88, there has been hardly any growth in non-farm employment [Chadha 1993]. Thus, more and more rural workers have had fewer days of work per year. Such a situation implies severe distress because of very low rates of growth of the agricultural sector leading to substantial out-migration of labour to seek employment in other areas both within and outside of the state³. Bihar has a substantial proportion of labour households in rural areas – one of the highest in the country and substantially higher than the national average. In 1987-88, 44.2 per cent of the workforce in rural areas was engaged in wage labour. There has been a steady growth in the incidence of wage labour since the early 1970s – from 39.5 per cent of the work force in 1972-73 it increased to 40.9 per cent in 1977-78, to 43.8 per cent in 1983 and 44.2 per cent in 1987-88. As in other states, there has been a phenomenal increase in casualisation of

rural labour. In 1972-73 the proportion of casual wage labour to total wage labour was 60 per cent, which increased to 80 per cent in 1987-88. Agricultural labourers constitute about 93 per cent of all the rural labour households – the state has the second highest incidence of agricultural labourers in India after Andhra Pradesh.

The wage rates of agricultural labourers are low in Bihar. In 1987-88 the daily wage rate of unskilled male agricultural labourer was Rs 13.39, which was lower than in most other states. The long-term growth rate in wage rates in Bihar for male agricultural labour over a 30 years period (between 1958-59 and 1987-88) was 8.68 per cent. This growth rate is lower than only two states – Kerala and Rajasthan. However, Bihar had a much lower base (Rs 1.30) level wage rate compared to states like Punjab. Not only money wages, but real wages in the state, both for male and female agricultural labourers, have risen since the early 1970s (Table 3). The rise in real wages has been really phenomenal and between 1970-71 and 1988-89, a 56.1 per cent increase took place in the case of male labourers, 70.8 in the case of female labourers [Jose 1988], which are quite impressive in comparison to other states – both high wage and low wage states. The rise in real wages has been particularly pronounced during the 1980s. There are a number of factors behind this rise. Apart from the relatively better performance of the agricultural sector, changes in rural labour market conditions due to out-migration of workers as well as state intervention through wage employment programmes have been the major factors behind it. Besides, in large parts of the state radical movement of the agricultural labourers have been a very important factor behind the rise in wages.

PATTERN OF POVERTY

The estimate of poverty in Bihar discussed earlier is based on NSS expenditure data. However, there are many other dimensions of poverty like calorie intake, housing, health, education, household possessions, assets, etc., which can provide a more comprehensive understanding of the problem. A survey conducted by the ANS Institute of Social Studies in collaboration with the ILO enables us to examine the issue in some details. This survey was conducted during 1981-82 in a stratified random sample of 12 villages in the plains of Bihar.⁴

The analysis of survey data on food and nutrition indicators of poverty shows that calorie intake exhibits distinct variations across socio-economic groups, but appears to be less reliable than other measures of nutritional intake and anthropometric status. Nearly 50 to 70 per cent of landless wage labourers fall below recommended intake

levels. Food quality indicators were more strongly associated with class, but only the richest groups have frequent intake of eggs, meat, fish and fruit. These food intake differences show up clearly in differences in anthropometric status. In particular, stunting is much more frequent among agricultural labourers than among other groups. Girls tended to be stunted more than boys.

The distribution of housing and domestic facilities was highly unequal among different social classes. Pucca houses are almost entirely absent among wage labourers, and the difference in house value between top and bottom groups is by a factor of 30. Electricity for lighting is rare (2 per cent of households). Treating kerosene lamps as an acceptable minimum, it was found that only around 10 per cent of agricultural labour households obtain this level, while for most other groups the figure reaches 40 per cent, only approaching 100 per cent for the top groups in the class and land hierarchies. The ownership of domestic assets is extremely low – over a quarter report no assets at all (other than cooking utensils, etc). Only 15

per cent of the households own a mosquito net 25 per cent a torch, 15 per cent a bicycle and 10 per cent a radio

Total expenditure is less unequally distributed. Clothing and medicine dominate expenditure by the poorest groups who obtain credit on the worst terms, interest rates averaging 50 per cent. Landless agricultural labourers own less than 1.5 saris on average, i.e., the majority of women in landless labour households own only one. Another index which catches attention is the ownership of a blanket or quilt. Winters are cold in Bihar and some protection against cold is essential. In the bottom expenditure groups 60 per cent of households have no blanket at all, few households have better than a cotton quilt in lower expenditure groups and only a quarter in the top groups.

Data on child mortality show a distinct decline with increasing economic status and female death rates are over 50 per cent higher than that of males. The high mortality of agricultural labourers shows up clearly about 20 per cent for boys and over 30 per cent for girls. The regional differences are also reflected in mortality. The advanced areas of north west Bihar have much lower mortality than average. It is worth noting the very high mortality of scheduled caste children.

Schooling is almost completely lacking for women and averages a more respectable four years for men. In agricultural labour households girls receive practically no schooling. Permanent labour households do particularly badly, no doubt reflecting the opportunities for early child labour in such households.

The distribution of total value of all assets (except grain) among various classes shows that agricultural labourers along with the non-agricultural class are not only at the bottom but the difference between these classes and big peasants as well as landlords is extremely wide. As a matter of fact the non-agricultural class is placed even worse

than the agricultural labourers. The difference in the value of total assets between the non-agricultural class and landlords is about 16 times. It is also noticed that female headed households have a lower value of assets compared to male headed households pointing the vulnerability of such households. The survey has shown that assets have a very strong association with poverty.

Indebtedness from traditional sources is widely prevalent in rural Bihar and the incidence is particularly high among agricultural labourers – about 85 per cent for casual labourers and 88 per cent for attached labourers. Labour households with high interest loans are seldom able to repay their debts. This often leads to debt bondage due to their current consumption, exceptional social expenditure and health expenditure. In regards to loans from institutional sources the level is not only low in Bihar but such loans have been mainly grabbed by the upper classes and big landowners.

Female headed households are found to be relatively poorer. Scheduled castes are invariably poor followed by Muslims and backward castes. Attached labourers who constitute about one third of total rural labour are relatively more poor than casual wage labourers. Casual wage labourers are generally of scheduled castes.

III Growth Performance and Poverty Alleviation Programmes

The rate of economic growth in Bihar has been slow from the very beginning. In 1960-61 Bihar was at the bottom among all the states of India in terms of per capita income. At present also it is at the bottom but with increased distance – in 1960-61 Bihar's per capita income was about two thirds of India's average per capita income; it declined to less than half towards the late 1980s [Mathur 1994]. Bihar's rate of growth during 1960-85 was 2.43 per cent which

after adjusting for the rate of population growth of 2.08 per cent gives only a 0.35 per cent growth of per capita income since the 1960s.

This dismal performance of Bihar becomes more glaring when the performance of its agricultural sector is taken into account. After independence the state witnessed a moderate rate of agricultural production – during 1952-53 to 1964-65 it was 2.97 per cent per annum which was better than many other states including Andhra Pradesh, Kerala, Madhya Pradesh, Maharashtra, Orissa, Rajasthan, Uttar Pradesh and West Bengal [Prasad 1987: 15]. The rate of growth of foodgrains production was even higher than the national average – it was 3.05 per cent in Bihar against 2.50 per cent for India as a whole. But the decline of the state on agricultural front started from the close of the 1960s. Between 1969-70 and 1983-84 the annual growth of agricultural production in Bihar came down to 0.42 per cent per annum [Prasad 1987: 15]. Between 1970-73 and 1980-83 the compound annual rate of growth of foodgrains production was negative (0.11) however since the middle of 1980s there has been some improvement in agricultural performance. As such the compound annual rate of growth in foodgrains production between 1980-83 and 1990-93 has been 2.33 per cent. The growth rate (compound) in agricultural production during 1980-90 has been of the order of 1.5 per cent per annum [CMIE 1994 Tables 7.1 and 7.4]. The very low growth rate in agriculture has been the main factor behind the persistence of poverty on a large scale. Due to the sluggish rate of growth in agriculture the state in spite of having some big industries that were established in the 1950s and 1960s did not experience their spread effects. Bihar which had achieved an average annual rate of growth of 18 per cent in industrial employment during 1951-61 slid down to 0.7 per cent per year during 1961-81. As discussed earlier

there has been a further retrogression in employment structure since then particularly since the early 1980s – there has been an absolute decline in secondary sector employment. The primary sector has absorbed this displacement of workers from the secondary sector, and consequently the percentage of workers employed in the primary sector has increased during 1981-91.

There are many factors behind economic stagnation in the state – the exploitative agrarian structure, lack of consolidation of landholdings, poor irrigation and water management, inadequate credit and extension services, lack of industrial culture etc. Often inadequate assistance by the central government and various agencies like banks and other financial institutions are also cited as reasons for the continuing backwardness of Bihar. However, it appears that most of the factors behind the state's backwardness are rooted in the failure of its political leadership and administrative apparatus to take the state along the path of social and economic development. Bihar was able to develop moderately up to the 1960s because the quality of the political leadership and administrative efficiency was reasonably good. It is a widely shared view that the quality of political leadership and administration has deteriorated since then and at present it is probably at the lowest ebb in the country. No doubt the state has an acute shortage of investible resources like every poor economy, but the utilisation of even these meagre resources has been utterly disappointing. In fact, it is widely believed that there has been a plunder of the meagre resources of the state on a large scale affecting its interests much more than other states of India. Though there has been no systematic and detailed documentation of this phenomenon in Bihar, many of the facts clearly point to this.⁶

In Bihar a peculiar brand of political class emerged. These political buccaneers had only one agenda, i.e. to grab political power and corner the maximum funds meant for

development. One of the essentials to rise up the political pyramid in the quickest time was to forge links with the crime syndicate. With the passage of time this process has accelerated – the criminalisation of politics, politicisation of crime and politicisation of the bureaucracy have taken place at an alarming rate. The venom of casteism has spread to every walk of life. Almost invariably postings in bureaucracy are done on a caste and money basis, which has seriously affected its moral and efficiency. Almost all the co-operative credit institutions of the state were captured by vested interests and they were twice superseded by the government. Not to talk of the provision of extension services by co-operative and other institutions, spurious inputs were distributed to the farmers. Many research studies have shown that there is gross misutilisation and malfunctioning in the distribution of credit and the marginal and small farmers have been grossly discriminated against. The co-operative movement has served the interests of the strong only [Nilkant and Das 1979: 34]. A major section of the bureaucracy is an active collaborator of this loot and political corruption.

This and practice of popular and sectarian politics have led the state to a state of financial bankruptcy. Huge funds are spent on the salaries of the big army of government and semi-government employees.⁷ Not only this, due to the inability and inefficiency of the political and bureaucratic system for the last several years, the state has not been able to utilise all the funds allocated to it in the annual plans. Now, for the last three years, the state's financial position has been so precarious that even the salaries of the university teachers and other semi-government employees have not been paid for the last several months. The state has been spending without caring to raise enough resources. Consequently, it has witnessed massive reductions in the plan outlays during the last few years. The annual plan of Rs. 2,200 crore during 1992-93 was almost halved the plan outlay during 1993-94.

would not be more than Rs. 1,200 crore and it is feared that in 1994-95 it would be further curtailed. Though the lower per capita plan assistance, meagre disbursement of funds by financial institutions, irrational royalty policies and other federal transfers are also responsible for the state's financial crisis, the major share of the blame lies with the state government.

Further, there is an acute power crisis in the state. Except Patna, all other places are without power for the major part of the day, seriously affecting agricultural and industrial activities. Capacity utilisation of the thermal power plants has been extremely low and losses of the Bihar state electricity board are enormous.

Due to the acute financial crisis and wrong policies and priorities, the development activities in the state, at least so far as the state's development expenditure is concerned, have come almost to a halt. Even the funds meant for the central government poverty alleviation schemes like Jawahar Rojgar Yojna have been reported to have been diverted temporarily to meet the salaries of its employees, affecting the implementation of these schemes. However, with all their defects in design and implementation in the prevailing acute financial crisis, it is mostly the poverty alleviation programmes like the Integrated Rural Development Programme and Jawahar Rojgar Yojna (JRY) which are somewhat

Source and Index: As in Table 4

visible in the name of development activities in present day Bihar. Ironically even such a big financial crisis does not deter the government from setting up new universities and administrative centres (like district sub division block etc.) which are mainly done due to political and caste considerations. The state has failed on almost all fronts to deliver the goods to the people particularly the poor.

In the wake of acute poverty and immiseration the poor of the state particularly the rural poor have adopted their own survival strategies and responses. One response is the substantial out migration of the rural poor to other areas – both rural and urban and inside and outside the state in search of livelihood. As yet another response the state has witnessed a relatively powerful movement (the so called extremist or naxalite movement) by the rural poor during the last two decades or so generating violence and tension.

Such a vulgarisation of politics and administration and the nexus between corrupt politicians, bureaucrats, contractors and criminals have played havoc with not only the development programmes in general but also with programmes specifically meant for the benefit of the poor. Immediately after independence no major programme for poverty alleviation was launched in the state as such except a few minor welfare programmes for the poor like the old age pension scheme in the mid 1970s. As in other states schemes like Food for Work NREP etc. were also launched. The public distribution system was operative earlier but its coverage was increased since the 1970s. At present the central government sponsored Integrated Rural Development (IRD) and JRY are the two most important direct poverty alleviation programmes in the state. But the programmes of old age pension and a few minor welfare programmes are still in operation. There are other programmes like land reforms, public distribution system (PDS) etc. which are not targetted specifically to the poor but have relevance for them. It will be interesting to see the overall impact of some programmes and their implications for the poor.

LAND REFORMS

After independence, Bihar was the first state in the country to abolish the zamindari system – the much hated stratum of intermediaries between the actual tillers and the state was removed and the tillers came into direct contact with the state. However though zamindari was abolished, the former zamindars were not deprived of their homesteads and private lands, which were quite large. Therefore the measure of zamindari abolition was complemented with the imposition of a ceiling on large holdings

in order to redress the inequitous distribution of land. After many hurdles, the first land ceiling act was passed in 1962 with subsequent amendments in 1972 and 1973. Some legislative measures to safeguard the interests of the tenants with regard to the fixation of rent and ejection of tenants were also undertaken. There were a few other agrarian legislations too – the Bihar Privileged Persons Homestead Tenancy Act, the Bihar Moneylenders Act etc., – which were enacted for the benefit of rural labour and the poor.

But the implementation of these various legislative pro-poor agrarian measures has been rather dismal. The most glaring cases are those of the land ceiling and tenancy acts. Till 1990 only 192.1 thousand hectares of land had been declared surplus of which only 152.2 thousand hectares have been taken possession of and 102.6 thousand hectares have been actually distributed (most of which are said to be low quality land). There is large scale violation of ceiling laws in the state. The principal reason for non implementation of the ceiling laws has been the lack of political will and collusion of the bureaucracy with landlords. Large scale benami transfer in land has taken place. Landlords have resorted to litigation which generally takes so much time that the very essence of the measure is defeated. A study conducted in 1986 in 15 sample villages spread over six districts of Bihar provides interesting facts regarding the implementation of land ceiling laws (Prasad 1986). According to this study only 1.53 per cent of the cultivable land was acquired and distributed whereas the surplus land amounted to 20.51 per cent. The implementation was not uniform. In four villages where the study was conducted the government did not initiate any action at all, not even a notice for submitting a return of surplus land was served to the owners. Further the government functionaries showed favour to landowners in classification

of land and areas so that the extent of surplus land shown remained lower than the actual. The study showed that the bigger landowners enjoyed better accommodation by the government functionaries than the smaller ones. There has been large scale violation of ceiling laws by religious and charitable institutions also. They have held much more land than prescribed under the law taking advantage of the exemptions given in the ceiling act (Pandey 1992). Another study (LBSNIAA 1991a) also found very inadequate implementation of the ceiling laws in Katihar, East Champaran and West Champaran districts where there is wide scope for acquiring much more surplus land. In the district of Furruckabad alone there were 210 landowners with more than 200 acres. Though the allotment of surplus ceiling land should be overwhelmingly from the SCs and STs in actual practice other castes constituted 48 per cent in number and 38 per cent in total area allotted. It is significant that in all such cases where cultivable lands were allotted there has been some perceptible change in the socio-economic status of the allottees. They felt more confident and partly relieved from the clutches of the landlords.

Provision of land, however small, has given them a sense of identity and something on which they can fall back. However, the average extent of land allotted was less than one acre, which is not economically viable. Those who were allotted uncultivable land were miserable. The facilities of irrigation, lending and rural development schemes were not well integrated with the allotments.

Tenancy reform remains an important question in Bihar because the state has a fairly significant proportion of cultivated land reporting tenancy. Though the overall tenancy rate has been reported to be of the order of 10 per cent as per NSS data of 1980-81, several studies have shown that the plains of Bihar, particularly north-east Bihar, has a high incidence of tenancy. A study conducted in 1981-83 showed that about 28 per cent of the cultivated land in the plains of Bihar were under tenancy [Prasad 1987] (the tribal region of the state shows a very low level of tenancy). A recent study [LBSNAA 1991b] in 15 villages spread over 12 districts reveals that the high incidence of tenancy is not only characteristic of areas with higher irrigation intensity but is equally characteristic of unirrigated land. The tenants are usually labourers, poor peasants and marginal farmers, although under the demographic pressures and due to some other factors small cultivators have also started leasing in land. Many researchers have highlighted the inter-linkage between landholdings, sharecropping and bondage leads to the process of economic stagnation in the countryside and immiseration of the poor.

The study by LBSNAA (1991b) showed that the principal form of tenancy in the state is sharecropping in which the majority of tenants equally share the gross produce with landowners. However, there were important deviations from this principal pattern in many parts of the state – in some cases there is prevalence of rack-renting in which the tenants bear the entire input cost and share the produce equally. In some other cases though the tenants share the input costs with landlords, the landowners receive between 50 and 75 per cent of the gross produce leading to a highly exploitative rent. In some parts of the state, particularly in the irrigated tracts, the system of fixed rent in kind or cash is also prevalent.

The statutory provision with regard to rent is 25 per cent of the gross produce, and the by-products are to remain entirely with the sharecroppers. Thus, except in some isolated cases, there is a large gap between what is statutorily provided and what the sharecroppers get. The system of tenancy is almost entirely concealed and informal and hence there is no security of tenure. The majority have their plots changed within a year or two thereby denying them the status

of occupancy tenants, in spite of the fact that a very high proportion of tenants have worked as tenants for more than 10 years with the same landowner. The pitiable condition of the tenants, both with regard to rent and security of tenure, has hardly been the target of any intervention by the government machinery. The experience in the state shows that the law and the administrative machinery has not worked. The sharecroppers are in a very weak bargaining position *vis-a-vis* landowners. Though in some limited areas like Madhubani and parts of central Bihar sharecroppers have asserted their rights and after their prolonged struggles have been able to secure better terms, in large parts of the state tenants are vulnerable as they have neither the economic strength nor faith in the justice system. The legal procedures are so clumsy, time consuming, expensive and biased towards landlords that tenants simply cannot resort to them. Further, the tenants are required to furnish documentary evidence of their cultivating the tenanted land, which they are simply unable to provide as tenancy agreements are entirely oral and informal

Over and above this, any move by the tenants to get justice is met with resistance by the combination of landlords, police and state machinery. In regard to other aspects of tenancy reforms, i.e. homestead and usufruct mortgage, their implementation is slightly better. According to the study by Prasad (1986), the land reform measures related to homestead land were implemented with good success, and the debt redemption legislation had also achieved better success in its objectives – about 54 per cent of households had received relief.

Thus, the implementation of the various land reform measures has been very slow and unsatisfactory. The main reasons for poor implementation are lack of political will, lack of organisation and consciousness among the poor peasants and agricultural labourers, the indifferent attitudes and retapism of the bureaucracy, lack of up-to-date land records, and legal obstacles in the laws. Fortunately some parts of the state have shown some awakening among rural labourers and poor peasants and there has been effective mobilisation of peasants.

TABLE 9: RESULTS OF EVALUATION OF IRDP IN BIHAR AND OTHER STATES IN EASTERN INDIA – MRD SURVEY

Items of Evaluation	Bihar	Orissa	West Bengal	Assam	India
1 Social classification of beneficiaries (per cent)					
Scheduled castes	29.7	20.6	23.5	8.4	28.5
Scheduled tribes	13.6	26.6	4.3	23.0	16.5
Others	56.7	52.5	42.2	71.6	55.3
Total	100.0	100.0	100.0	100.0	100.0
2 Sectoral classification of beneficiaries (per cent)					
Primary	25.1	17.7	23.7	44.7	43.6
Secondary	15.8	28.5	34.3	10.4	11.5
Tertiary	49.6	54.8	42.0	44.9	44.9
Total	100.0	100.0	100.0	100.0	100.0
3 Percentage of beneficiaries selected through gram sabha	0.9	94.7	100.0	21.7	65.4
4 Percentage of beneficiaries satisfied with quality of assets provided	46.7	88.8	84.0	87.7	80.0
5 Investment (subsidy/credit) per beneficiary (Rs)					
Primary	3375	3466	4383	5288	4276
Secondary	3338	2236	3299	5125	3631
Tertiary	4111	2833	4532	5785	4512
6 Percentage of beneficiaries who thought investment was sufficient	90.3	99.2	97.3	90.3	82.9
7 Percentage of beneficiaries trained under TRYSEM	2.5	24.3	8.1	5.3	5.1
8 Percentage of beneficiaries who received Vikas Patrika	3.8	74.4	36.7	52.9	38.5
9 Percentage of beneficiaries who had undated Vikas Patrika	0.8	69.2	10.0	18.1	24.3
10 Percentage of beneficiaries who reported after care services	33.7	72.8	0.7	9.3	18.8
11 Percentage of beneficiaries whose assets are intact	67.4	72.5	72.1	75.2	71.0
12 Percentage of beneficiaries crossing poverty line of Rs 3,500	91.3	63.9	95.7	88.3	81.0
13 Percentage of beneficiaries crossing poverty line of Rs 6,400	42.6	11.5	18.3	39.1	27.0

recent years. It is reported that this has influenced the course of implementation of land reform laws in such areas.

PUBLIC DISTRIBUTION SYSTEM

Though PDS does not cover only the poor, the dependence of the poor on it is very large. Further, some of the commodities like kerosene oil are mostly purchased by the poor. Not only is there large-scale corruption in the distribution of these commodities to the poor, but the coverage of PDS is also extremely low, only confined to some pockets of urban areas. The data collected by NSSO (1990) show that in rural Bihar the percentage of outlay on purchase from PDS to total purchase was 0.42 in case of rice and 1.51 in case of wheat; the corresponding figures for urban areas were 0.29 and 7.05. This is an extremely disappointing performance in view of the fact that in states like Kerala the percentage purchase from PDS to total purchase of rice and wheat are 51.36 and 92.04 in rural areas and 46.19 and 91.98 in urban areas respectively. In fact, Bihar's performance is the worst among all the states.

POVERTY ALLEVIATION PROGRAMMES

The above mentioned study conducted by ILO and the A N S Institute of Social Studies between 1981 and 1983 in the plains of Bihar throws considerable light on the unsatisfactory working of the poverty alleviation programmes (PAP). The awareness and benefits derived from the ten policies related to PAP are presented in Tables 4 and 5.

Old age pension scheme: This scheme aimed to give pensions of Rs 30 per month to old people in the low income groups, who do not have significant amounts of land or other significant sources of income. Knowledge of the scheme was very widespread – only in one out of six districts studied the percentage of people aware of the programme fell below 75 per cent. Moreover, this policy was relatively successful in reaching the poor – over 30 per cent of scheduled castes, over 25 per cent of agricultural labourers, over 30 per cent of Muslims (predominantly agricultural labourers), poor middle peasants and non-agriculturists (the latter mainly low income), and 27 per cent of landless, had benefitted from the programme. If one takes into account the fact that many households do not have an eligible older member, this implies quite a large coverage. However, there was a significant number of beneficiaries among the big peasants and landlords and landed classes who were outside its scope. So the targeting of the poor was far from perfect. About one out of eight of those who cultivate more than 10 acres of land also got the old age pension.

Employment schemes: There have been many schemes of rural works, some in the context of flood or drought relief, some as part of larger national anti-poverty programmes designed to provide employment to agricultural labourers. The employment schemes had much less impact, awareness was moderate (33 per cent) and mainly concentrated in two districts and in larger peasant and landlord households. Benefits were concentrated in one backward district (about 12 per cent) in one village and 5 per cent in the second, and although beneficiaries were generally from the lower part of the class hierarchy including middle peasants as well as agricultural labour, they formed only a small part of the sample population as a whole. Its impact was thus almost negligible.

Antyodaya: Awareness of this scheme exceeded 20 per cent in only three villages out of 12 villages studied and was essentially concentrated among the village elite (Brahmins: 40 per cent). Gains from the scheme were negligible, and it benefitted mainly middle and big peasants and landlords and not the poorer groups who were the ostensible target. The benefit largely went

to those who were cultivating more than 5 acres or even more than 10 acres of land. This policy was implemented in a manner which went against its very objectives.

Schooling subsidy: Under this programme a series of scholarships and subsidies for scheduled castes, scheduled tribes and other underprivileged groups were to be offered by the education ministry. Only about a quarter of the population had heard of schooling subsidies and scholarships and only 3 per cent of households had benefitted. On the whole, benefits went to the better off groups.

Nutritional programmes: This had hardly any impact at all as it was operational only in three out of 12 sample villages, and outside these villages even awareness was low. The pattern of gain was slightly worse than that for schooling subsidies in so far as the poor are concerned. However, neither this programme nor the schooling subsidy was meant exclusively for the poor.

Land reforms: Knowledge of and benefits from land reforms were again concentrated in only two districts, with the knowledge highest among landlords. The proportion benefitting was very small, and it was

TABLE 10: RESULTS OF BLOCK-LEVEL EVALUATION OF IRDP IN BIHAR: DRD Survey

Items of Evaluation	Nalanda N=124	Nawadh N=128	Hazaribagh N=99	Dumka N=113	Ranchi N=65

VISIONARY

**In 1978, a vision to be one of India's
best-managed, profit-making public sector undertakings.
Today a reality.**

Rashtriya Chemicals & Fertilizers Ltd. (RCF) is one of India's biggest fertilizer and chemical companies with 10 operating plants and 100,000 employees in 10 major plants at India.

Established in 1973, RCF has come to be known as:

- First to introduce latest technology fertilizer plant with latest Indian technology in the country.
- First to produce Nitrophosphate fertilizer in the country.
- First to technologically upgrade old plants to reduce energy consumption, reduce pollution and increase production capacity.
- First public sector undertaking to adopt advanced systems of environment monitoring and management. RCF's plants are the cleanest plants.

- First to produce Methanol, Methamonyl, Dinitrophenylamine, all export substitute products.

Today, RCF is poised to enter the field of chemicals in a big way. Further expansion and fertilizer production is underway to ensure India's fertilizer independence.

To meet the challenges of the future, RCF has formulated some key strategies: Diversification and joint venture projects for production of fertilizers and intermediate chemicals.

All this is being supported by RCF's modern and advanced production facilities. First of Nov 87.

**RASHTRIYA CHEMICALS
& FERTILIZERS LTD**

Regd. Office: 10, Connaught Place, New Delhi-110022

For A Rich Harvest

Achievements
Every 8th bag of urea in India comes from RCF. Installed capacity 1.9 million tonnes of urea production.
Received Award of Excellence for achieving MOU targets in 1989-90.
Rated 'Very Good' since then.
Produces 0.12 million tonne of phosphatic fertilizers saving country's precious foreign exchange.
Introduced Optimization Schemes and Advance Control Systems for sustained load, energy saving and increase in production.
Sales turnover over Rs. 1000 crores.

530 RCF 127

concentrated in both agricultural labour and big peasant classes, with landlords also sharing in the overall gain. Of the little benefit that accrued under this heading, the highest gains were recorded by those households cultivating more than five acres – a serious outcome for a policy that was supposed to be transferring land to those with few assets. It is clear that the norms laid down for the distribution of land were largely flouted.

House sites for landless labour: This scheme showed a distribution which favoured scheduled castes and casual agricultural labour, but only 4.5 per cent of the former and 3.7 per cent of the latter reported benefits. While 2.8 per cent of landless households received land under this scheme, 4.8 per cent of those cultivating five to 10 acres also got such homestead land, which they were not entitled under the law.

Maternal and child health programme: Reception of and benefits from the maternal and child health programme were negligible except in two villages, where too they were small.

Drinking water programme: Much better results were achieved with the drinking water programme. Regionally it was very unevenly distributed with less than 15 per cent awareness and virtually no benefits in all the villages. But in the other half there were widespread benefits, and they were also concentrated in the poorest groups. Nearly 30 per cent of agricultural labourers benefited from this programme, and the spillover to higher income groups was small (6 per cent big peasants; 3 per cent landlords).

Flood and drought relief programmes: Benefits from these programmes were rather erratically distributed, which is to be expected as the programmes depend on the occurrence of flood and drought. A higher level of benefits was observed among agricultural labourers (3.8 to 6.5 per cent) than among peasants and landlords. The benefits were most pronounced among the landless.

Thus, the survey has provided a very unsatisfactory picture of the working of the anti-poverty programmes, both in terms of awareness and benefits. The coverage of all these policies, except the old age pension and drinking water, was extremely low. The policies, which were exclusively meant to provide some basic needs and relief to the economically weaker sections of the rural population, not only reached a very small proportion of the population, but in addition their targeting on the poor was far from perfect since the benefits from the policies were availed of by landlords and the big cultivating classes who were not at all entitled to them, often in contravention of the legal provisions. Therefore one cannot ignore the fact that these policies were used by the rural

rich to serve their own interests. This study also showed that in spite of the high level of traditional indebtedness, institutional loans are not only low but have been cornered mainly by big landowners belonging to upper classes and castes.

RECENT INITIATIVES: EXPERIENCE OF JRY

Since the beginning of the 1980s, some other poverty alleviation programmes were also launched in the state. IRDP and the various wage employment programmes like the National Rural Employment Programme (NREP) and Rural Labour Employment Guarantee Programme (RLEGP) (merged as Jawahar Yojana since 1989) have been the most important anti-poverty programmes in recent years. A sum of Rs 299 crore was spent on the NREP/RLEGP during the Seventh Plan (1985-90); Rs 73 crore and 88.8 crore were spent on the merged Jawahar Rojgar Yojana (JRY) during 1990-91 and 1991-92. In the Eighth Plan (1992-97) the proposed outlay on JRY is Rs 650 crore of which Rs 250 crore is the capital content. It was claimed that 64.89, 69.91 and 75.34 lakh mandays of employment were created in rural areas under NREP/RLEGP in Bihar in the years 1985-86, 1986-87 and 1987-88 respectively. Under JRY in 1990-91, apart from the Rs 73.70 crore of the state's share, Rs. 292.35 crores were released as the central share, and it was claimed that 1130.1 lakh mandays of employment were generated.

However, all was not well with the programme of employment generation. An evaluation of NREP in the backward district of Purnea shows that the programme hardly fulfilled the objectives of adequate creation of gainful employment in rural areas by strengthening the rural economic infrastructure and assets and improvement in the overall quality of life [Verma et al, 1987]. It was found that the rate of out-migration of rural labour during lean periods did not decrease even after the introduction of such programmes. Not only that, in most of cases labourers did not get the prescribed wages and in many cases outside labourers were hired by the contractors in place of local labourers so as to pay lower wages. Assets created were not only of low quality but universally unproductive. School building, village community building, Harijan houses, etc, were some of the items which were built almost everywhere, but the most needed productive assets like repair of irrigation dams, ponds, etc, were hardly undertaken anywhere. Social forestry was attempted at some places but with very unsatisfactory results.

The people of the villages were hardly taken into confidence while envisaging the scheme. It was found that the objectives of NREP were not clear to high level

functionaries only but also to lower level functionaries and executing agents. It appeared that different development agencies lacked coordination [Verma 1987]. Yet another study of the performance of NREP in the district of Siwan [Kumar 1993] shows that the programme did not contribute significantly either to the improvement of wage rates or of bargaining power of the poor. In overall terms, it had some positive impact too. At least in some seasons and in some operations it exerted pressure on wage rates through intervention in the labour market. It was found that the wage rate in non-agricultural operations was close to the minimum.

There have been some important changes in the programme since the merger of NREP into JRY. Not only do the panchayats directly receive the money, but the responsibility for executing the programme/scheme lies with the village panchayat itself instead of block officials or their contractors. It is believed that the new arrangement has produced relatively better results. The better management of Jawahar Rojgar Yojana by panchayats compared to the bureaucracy is because of people's growing consciousness about these programmes and their pressures on the elected representatives to deliver the goods. In the specific context of Bihar, the existence of various groups (based on caste, class or any other consideration) and intra-village rivalry exerts some pressure on the panchayat functionaries to do something. Though the panchayat leaders are as corrupt as the bureaucracy, the fear of facing the next election and the dynamics of village life forces them to work and deliver to some extent. The bureaucracy faces no such compulsion and accountability. Also it has probably not as good an understanding of village problems as the panchayat functionaries. Although it would be naive to expect spectacular results given the prevailing socio-economic milieu, even this relatively better performance of the panchayats compared to the bureaucracy has important implications for the implementation of government programmes.

As a matter of fact JRY is the most visible rural development programme in the state. During the last few years the programme has seen expansion in several respects – in terms of funds allocated and utilised as well as mandays of employment generated (Table 6). In 1991-92, 837 lakh mandays of employment were generated, which increased to 1,036 lakh in 1992-93 and further to 1,474 lakh mandays in 1993-94. Achievement of employment generation to targeted employment was 100 per cent in 1993-94. In spite of several defects, the programme has made an impact in rural areas in several ways by providing employment, however small; constructing houses

for the poor under Indira Awas Yojana; and creating at least some social infrastructure like school buildings, drainage, etc.

IV IRDP in Bihar

IRDP is the most important poverty alleviation programme in the state with a wide coverage, hence we attempt here to discuss its role in poverty alleviation in somewhat greater detail. Before we describe its working, we should note that a programme like IRDP which promotes self-employment as a strategy has relevance for Bihar where the land-man ratio is one of the lowest in the country. A poor land-man ratio will always imply that the scope of increasing wage employment in agriculture is very limited, and thus the promotion of self-employment plays a very crucial role in reducing rural poverty.

IRDP was introduced in Bihar during 1978-79 in 310 out of a total of 587 blocks. Initially the concept of IRDP was quite new to both the block officials and the credit agencies, hence in 1978-79 the progress of IRDP was very poor. Out of the total allocation of Rs 1,024 lakh, a bare 19.1 per cent of the budgeted amount was utilised. The geographical coverage of IRDP was extended the following year to another 15 blocks, bringing the total number of covered block under IRDP to 325 in 1979-80. But even in its second year the programme was in its formative stage. A major change in its dimension and thrust was brought about in 1980-81 when under the Sixth Plan (a) its coverage was extended to all the blocks, and (b) financial allocations for the programmes were increased. Significant changes were made in the state development administration to ensure effective implementation of IRDP. The programme was carried over through the Seventh Plan period with even greater emphasis and, by now, it has been operating for about a decade and a half.

Data pertaining to yearwise physical and financial targets and achievements under IRDP in Bihar since its inception are presented in Table 7. It is quite obvious from the table that the whole programme has received considerable attention by the development administration of the state. This is presumably because the central government (which has planned the whole programme and was bearing half of its cost) was able to impress right up to the district or even block level functionaries that IRDP is a very special programme, different from many other development programmes which had weaker objectives, limited durations or even insufficient financial allocations. It is further interesting to note that the programme has expanded with higher and higher yearly physical targets. As a result the quantum of assistance per capita shows a steady upward

trend (Table 8), from Rs 1,090 in 1980-81 to Rs 4,976 in 1989-90.

During 1980-81, when IRDP was extended to all the blocks in Bihar and was made an important part of the Sixth Plan, there were major changes in the development administration in the state, geared to the needs of IRDP. To begin with, the state government announced the formation of District Rural Development Agencies (DRDA) in all the districts. The DRDAs were now made the model agencies for co-ordinating the activities of all the development departments in the implementation of IRDP. To make the DRDAs powerful and effective, a senior civil service officer (to be called deputy development officer or DDC) was posted who was to relieve the hard pressed district collector of the burden of development administration. The problem of district collectors being overburdened with law and order problems or regular administrative duties is probably even more serious in Bihar, and this bifurcation of routine and development administration was thus a very positive change.

This apart, the planning from below and association of credit agencies in the planning process were two of the most vital strengths of IRDP and were designed to ensure the smooth flow of funds to the programme. The district level agencies assisted by block level agencies were to identify that portions of the plan which required credit support.

A second important change in the development administration was the expansion of the banking system in the state. Bihar has been one of the most poorly banked states in the country. There has taken place significant branch expansion in rural areas since the mid-1970s. Although there is a considerable gap between Bihar and the national average in banking facilities, the gap has become narrower. This expansion of banks was very crucial because, as mentioned before, the most important factor which placed the IRDP on an improved footing compared to earlier programmes was the well defined role of credit agencies in its implementation.

EVALUATION OF IRDP

The importance of IRDP as a poverty alleviation programme is reflected not only in the large financial allocations for it or the huge administrative efforts behind the programme, but also in the considerable efforts that were made to evaluate the programme. Many such evaluation surveys have been sponsored by the government itself while others have been carried out by researchers. Of the evaluation surveys sponsored by the government and carried out by external agencies, we have one initiated by the ministry of rural development, government of India. We shall now discuss

the results of this survey in a comparative framework, taking the other three major eastern states (Orissa, West Bengal and Assam) into account. Below we discuss an evaluation study sponsored by government of Bihar which covered selected blocks in different districts.

The survey sponsored by the ministry of rural development (hereafter MRD survey) covered the entire country; the canvassed questionnaires were fairly detailed covering all the important dimensions of the implementation of the programme. In Table 9 we have presented information relating to only 13 dimensions which are most relevant. In regard to the first two items, viz, social and sectoral classification, the position of Bihar is seen to be quite satisfactory: (a) the scheduled castes and tribes together account for a little less than half of the beneficiaries, and (b) the sectoral classification is rather similar to other states – it shows that opportunities for self-employment in agriculture are limited in Bihar. Two important defects of the implementation of IRDP in Bihar are reflected in the next two items of process of selection and quality of assets. In spite of pointed instructions to select beneficiaries through the gram sabhas, officials themselves have selected nearly all the beneficiaries in Bihar. It would, however, be wrong to infer from this that officials had ignored the gram sabhas in Bihar or that they are so thoroughly dominated by the local landlords that officials found it wiser to bypass them. The fact that officials themselves are not efficient or honest is indicated by the quality of assets supplied in Bihar. Whereas in the neighbouring state more than 80 per cent of the beneficiaries were provided with good quality assets, in Bihar it was only 46.7 per cent. Although the per family investment (i.e., subsidy plus credit) is a little lower in Bihar than in West Bengal, Assam and all India, it was judged to be enough by more than 90 per cent of the beneficiaries. Poor integration between TRYSEM and IRDP is an all India phenomenon and this absence of integration was even more pronounced in Bihar. One of the striking features of IRDP implementation in Bihar was the unfortunate impression among development functionaries in general that their role in the whole process was restricted to disbursement of credit and subsidy. The crucial role of post-disbursement activities (after care support or monitoring) was ignored by development officials, which again must have contributed to the relatively poor performance of IRDP in the state. It is seen in Table 9 that only 3.8 per cent of the beneficiaries in Bihar were provided with Vikas Patras and only 0.8 per cent had an updated Vikas Patra – the corresponding figures for other eastern states and all India were much higher. The

general conclusion that emerges from the MRD survey is that the implementation of IRDP in Bihar was the poorest among the four eastern states. It was thus anomalous to find that the percentage of beneficiaries crossing the poverty line (of Rs 3,500) was as high as 91.3 per cent in Bihar. One would thus suspect that the selection of beneficiaries in Bihar was improper, in that a substantial number of them were already above the poverty line or marginally below it. But in the prevailing situation in Bihar even such a moderate impact of IRDP is not a small achievement.

Apart from the MRD evaluation survey, another comprehensive evaluation of IRDP in Bihar was sponsored by the department of rural development of the state government (hereafter DRD survey). This was proposed to be done in a phased manner covering one block in each district in each phase, and till now reports of some block level evaluation studies have already been submitted. The discussions here covers the blocks of Asthawan (Nalanda district), Govindpur (Nawadah), Simaria (Hazaribagh), Shikharipoda (Dumka), and Ormanjhi (Ranchi). Interestingly, out of these five studies, three (except for the first two) are in the southern plateau region of the state where the scheduled tribe population is concentrated. In Table 10 we have presented some selected indicators of the working of IRDP in those blocks. The total number of beneficiaries included in the evaluation survey is more than 500, thus it provides us with a strong database for examining the working of IRDP in Bihar.

Unlike in the MRD survey, the social classification of the beneficiaries in the DRD survey was done on the basis of land endowment. In most blocks, the beneficiaries were mostly landless labourers or marginal farmers. Only in Hazaribagh and Dumka was there deviation from the pattern – while marginal farmers were too many (71.7 per cent) in Hazaribagh, small farmers were so (58.4 per cent) in Dumka. Pending any further information, it might be conjectured that this typical pattern of social classification of beneficiaries is because of the specific nature of land distribution pattern there; after all landlessness is not as widespread in tribal areas as in non-tribal areas in the plains. Information on selection of the beneficiaries who were surveyed, who were selected through the gram sabha and who were granted schemes of their own choices, indicates that the directive of selection through gram sabha was breached almost universally. However, it does not mean that the selection of schemes through the choice of beneficiaries as per their requisite skills is always proper. For example, if 10 beneficiaries opt for sewing machines in a village (each being unaware that others have done the same), granting of sewing machines to all of them will

probably mean underutilisation of the assets (and hence low additional income generation) by most of them, in spite of the fact that they were all given schemes of their own choice and, hopefully, they all had the requisite expertise to run them. In regard to disbursement of assistance, most of the beneficiaries received it within a reasonable period (i.e. three months) as most of them were also granted loans in kind, which prevent to a great extent misutilisation of assistance by poor beneficiaries by spending it on some immediate consumption need. An important deficiency in the working of the IRDP (apart from the bypassing of gram sabha) was its failure to integrate with the TRYSEM scheme. The two schemes were run almost independently which must have affected the success of both.

Having identified the beneficiaries and provided assistance to them within a reasonable period, the next task of the IRDP officials was to monitor the programme, and it is here that we find the most glaring weakness of the scheme. The percentage of beneficiaries reporting at least one visit (not an adequate number of visits) was nil in two blocks of Nawadah and Dumka, negligible in Hazaribagh and Ranchi, and a modest 36.0 per cent in Nalanda. A similar impression of extremely poor monitoring also emerges from the figures of percentage of beneficiaries who received *Vikas Patrika*. These percentages are too low in three districts, and even where it is high or moderately high, it is partly because they were given *Vikas Patrika* much after the disbursement of loan and subsidy, probably because the officials had got the news about an evaluation survey.

Considering the fact that the selection procedure was not proper and monitoring of the scheme was also not effective, it is rather surprising to note that the scheme has shown moderate to high success in the five blocks under study. Although the percentage of beneficiaries crossing the poverty line of Rs 6,400 is very small (except in Nawadah), many families have crossed the line of Rs 3,500 – ranging from 50.4 per cent to 40.7 per cent – and this additional income is closely related to additional employment generation. These findings from the DRD survey are very similar to those emerging from the MRD survey, and here too the only way of explaining the apparent moderate success of IRDP is by assuming that many of the beneficiaries were either above the poverty line or just marginally below it. Finally, it might be noted that the scheme is under severe stress as the percentage of beneficiaries who are paying their loan instalments regularly is very low (around 40 per cent); in Nalanda it reaches a moderate figure of 66.9 per cent. Contrary to rational expectations, the repayment behaviour in different blocks is not related to increase in

income. In Nawadah, the increase in income is only 11.5 per cent, but repayment is most satisfactory there; whereas although the average per capita income has increased by 30.2 per cent in Ranchi, the repayment position there is the weakest. One may thus conclude that the administrative efficiency of the development administrative and the banks, along with the populist stand of the political authorities, are responsible for the financial mismanagement of the scheme.

From the above description, it is clear that there is a lot of scope for arbitrary action in selecting the beneficiaries. Lack of norms for estimating income from various activities, and lack of vigorous scrutiny by block and district level authorities of the estimates of income prepared by block level workers (VLWs), lead to faulty selection of beneficiaries. Supply of substandard assets at prices higher than the market price is a common feature, but probably the most important defect is that after procuring the income generating assets, the beneficiaries do not receive much assistance in terms of supply of raw materials, marketing support, technical advice, training, etc, due to which the productivity of the assets declines. There is no follow up of the scheme given to the beneficiary. The machinery involved in the implementation of IRDP in Bihar has the single-minded objective of fulfilling the target at any cost. The only effort made by the machinery is subsidy administration. Consequently, in a substantial number of cases the beneficiaries only "temporarily" cross the poverty line at the time of acquiring the assets but later on slump down to their previous levels, in many cases with increased indebtedness.

It is reported that in the newly designed cash disbursement scheme the element of bribe has been done away with to a great extent. But the other problems of vital importance are still there, affecting the impact of the programme.

V Islands of Hope

The overall situation that emerges from the above description is that the efforts of the state towards eradication of poverty have largely failed. In the absence of economic growth, both in agriculture and industry, and unsatisfactory working of various anti-poverty welfare programmes, the plight of the poor has not improved as a whole. The efforts towards poverty alleviation have largely been wasted and gains have been substantially cornered by the non-poor, even in programmes specifically addressed to the poor. However, to be fair, even amidst the general non-performance, the poverty alleviation programmes have had some positive impact. In terms of direct economic gains to the poor also, at least there has been

some marginal impact. We had seen earlier that at least two of the policies in the early 1980s – old age pension and drinking water – had reached their targets rather well, albeit with leakages and loopholes. Though JRY and IRDP could have been implemented in a much better way, particularly with regard to the selection of beneficiaries and after care support (in the case of IRDP), at least some marginal gains have accrued to the poor. For the first time, the poor in significant numbers are having banking experiences. These programmes have also indirectly helped the poor by influencing the rural labour market. Employment generation from IRDP, NREP, and RLEGP made some contribution to the significant rise of rural wages in the state since the early 1980s. The non-economic gains of these programmes have not been less important. These poverty alleviation programmes, notably JRY and IRDP, have become well known to the rural poor, and their execution and management have created considerable consciousness among them. The poor have been mobilised in a large number of areas on some issues concerning the programmes like bribe-taking by officials, proper allocations of funds, etc. The rising consciousness and mobilisation of the poor have not only contributed to the better execution of these programmes, albeit marginally, but have also created pressures on state policy about the poor. The poor are probably being talked about more in the realm of state policies.

As a matter of fact, the mobilisation of the poor on several issues is a significant development and offers some hope amidst the general climate of despair. In the context of the acutely exploitative agrarian structure and impoverishment of the poor, a significant part of the state, particularly the central districts, has been experiencing powerful movements by poor peasants and agricultural labourers, which have led to much bloodshed. Several types of organisations, right from Gandhian to extreme Maoist, are working in the state, and they have been able to mobilise the poor on a large scale not only on such economic issues as minimum wages, land reforms, fishing rights in village ponds, etc, but also on such social rights as the dignity of women. This substantially heightened consciousness of the poor for their cause has partly been aroused by the unsuccessful implementation of the various programmes for bettering their conditions. The accumulated frustrations and anger generated by the gap between their aroused hopes and reality has been an important factor behind the massive mobilisation of the poor in a large part of the state.

There are several achievements to the credit of the movements. Undoubtedly they have been able to raise agricultural wages in the areas of their influence. The government machinery has hardly played any positive

role in this respect because of collusion between the labour administration and the rich farmers. In about 900 villages in the districts of Bhojpur, Patna, Nalanda, Rohtas, Jehanabad, Aurangabad, Gaya, Siwan, and east and west Champaran, successful wage struggles were launched by the Bihar Pradesh Kisan Sabha (one of the most powerful organisations of poor peasants and agricultural labourers in Bihar at present), leading to substantial rise in wages.¹⁰ In fact wage struggle has been one of the most important instruments of mobilisation of these organisations.¹¹ Sometimes they have even been mature enough to take into account the element of land productivity while agitating for increased wages. Land reform has been yet another issue on which they have mobilised the poor. If a substantial portion of the surplus land was acquired in Bihar in the mid-1970s, it was largely due to the pressure generated by the movement launched by these organisations. Though the movement to capture "gairma zarua" (common land) and surplus land above the ceiling has led to occasional violence in the countryside, it has also aroused the government from slumber. In many cases not only have these organisations have captured gairma zarua land hitherto occupied by the rural rich, and distributed it among the poor, they have also made provision for irrigation and co-operative farming and in some villages they have produced good results.¹² It is well documented that the sharecroppers' organised movement in Madhubani and Champaran, particularly in the former, has done much to give them security of tenure and to raise the tillers' share of the produce. Though the better implementation of direct poverty alleviation programmes like IRDP and JRY has not been on the agenda of these organisations, some isolated gains in this direction are also encouraging. In several cases the issues of wrong selection of beneficiaries under IRDP, digging of hand pump wells and construction of drainage and houses in harijan localities, non-availability of ration cards to the poor, bribe-taking by block and bank officials for disbursements of assets, etc, were taken up actively by them and in several cases the wrongs have also been corrected.¹³

In regard to the role of the administration, it has already been mentioned that the general orientation towards the poor is not one just of indifference but of active opposition. A part of this active opposition is largely dictated by the local land-based vested interests and politicised criminal and lumpen elements; the vulnerability of the administration to corruption makes them even more active opponents of the poor. That the bureaucracy is not handicapped organisationally or in terms of required manpower and the real reason behind its ineffectiveness lies in its social composition

and the social milieu within which functions, is demonstrated by a few of its highly localised success stories. Successes are generally caused by ultra enthusiasm on the part of a small group of administrators who decide to implement a programme on a 'mission basis' in a rather small area. Mobilisation of the rest of the bureaucracy is done by pressure as well as persuasion, and the small size of the project area enables the group to closely monitor the programme. As is expected, even on small positive step by the administration enthruses the expected beneficiaries to take two steps forward and thus it generates momentum, ensuring the success of the programme. In recent times, one successful programme was the digging of several thousand irrigation wells in district Dumka, known as "Jal Hain Jan Hai" changing the agricultural economy to some extent. So massive was the participation of the beneficiaries in the implementation of the programme that they had completely eliminated the middlemen or contractors, the most important channel of "leakage" in such programmes. The district administration had launched this scheme after judging the people's perceptions about their needs – the demand for water was made by almost everyone in this dry district. The scheme has been found to be so successful that there has been a tremendous increase in the vegetable production of the district, causing a somewhat significant rise in the incomes and employment opportunities of the poor. It has been claimed that there has been a substantial reduction in the out-migration of labour from the district after launching the scheme. Vested interests like middlemen have tried their best to sabotage the scheme by imposing many hurdles, but an alert administration has been able to surmount many of them.¹⁴ Of course, this scheme pertains to only a limited area, but the potentialities thrown up by it have immense implications and lessons for other parts of the state.

Though the positive impact of the poor peasant and agricultural labourers' movement in improving the lots of the poor and towards better execution of poverty alleviation programmes is limited, it has at least shown the potentialities which may be utilised. In a state where the bureaucracy is inefficient and corrupt, village panchayats are without elections for more than two decades and dominated by the rich and vested interests, and good NGOs are rare, organisations of the prospective beneficiaries may be the only hope for the future.

VI Conclusions

During the post-independence period, particularly since the 1960s, the rate of growth of the Bihar economy on both the agricultural

and the industrial front has been dismal. The rates of growth have been among the lowest in the country due to which the incidence of poverty also did not decline. Only in recent years has poverty declined in the state, thanks to relatively better agricultural performance, rise in real wages, and partly to various poverty alleviation programmes. The measures taken for direct intervention for poverty removal have also produced unsatisfactory results mainly due to deficiencies in the delivery system. The different organs of the delivery system – panchayats, the bureaucracy, co-operatives, etc. – have really served the interests of the rich who cornered benefits even from those schemes which were specifically meant for the poor. The strong nexus of landed interests, polity and bureaucracy, and in recent years lumpens, has been working against the poor. The situation is getting out of control – the poor are becoming restive and in large parts of the state they have been mobilised. In fact during the last two decades or so the countryside has witnessed much turmoil and violence. Hence even the elements which have been hitherto hostile to the poor are now ready to reconcile to the new realities though reluctantly.

The attack on poverty in the state needs to be tackled at two levels. Any vision of poverty alleviation will have to accelerate the growth rate in the agricultural sector. Bihar, as we have seen, is a poor economy which subsists mainly on agriculture whose fortune fluctuates with the vagaries of nature. This is because irrigation exists only in a limited area and much of it is protective in nature, rather than being aimed at production or growth. The poor are the worst victims of recurring floods in large parts of the state. Public investment in irrigation, flood control, drainage, rural electrification and generation of rural power supply are the inescapable preconditions for development. Land reforms, including tenancy reform and consolidation of holdings, have to be emphasised in this context. There is a need to take up an ambitious scheme of rural industrialisation also. Bihar has witnessed a deterioration in the employment structure in recent years – the proportion of workers engaged in the primary sector has increased and that in the secondary sector has declined. This is really a matter of concern and therefore schemes of rural industrialisation and other schemes of diversification of the economy in rural and semi-urban areas are urgently needed.

The direct intervention by the state in the form of poverty alleviation programmes should be simultaneously taken up to providing not only relief to the poor, but also to generate productive capabilities among them which otherwise might remain largely unutilised. We have seen earlier that the availability of different types of assets is not

only very low but their distribution is extremely skewed among classes. In fact the non-availability of productive assets is one of the main reasons of the persistence of poverty in rural Bihar, particularly among agricultural labourers, poor middle peasants and the non-agricultural class. Consequently, provision of assets, particularly productive assets, assumes importance in any comprehensive scheme for the eradication of poverty. It points to the desirability of government programmes like IRDP which would lead to the creation of productive assets and employment among poor households in rural areas. The prevention of large-scale out-migration of rural labour from the state calls not only for the creation of more wage employment but also its creation at reasonable wage rates, hence the need for wage employment programmes. Literacy programmes have to play an important role in the state which has the highest rate of illiteracy in the country.

Of course the better execution of the programmes of infrastructural development and poverty alleviation has to be ensured if the state is to come out at all from the present rut. Much time and resources have already been wasted by now. Fortunately the poor are also ready to bear their share of the burden, thanks to their considerably heightened consciousness generated by acute impoverishment and other developments. In many places they have already shown potential. There are also a few examples of good and efficient elements in the bureaucratic machinery which have shown their mettle. In the prevailing corruption-ridden milieu of Bihar, the story of NGOs is not very different, but here again some instances of successful NGOs with missionary zeal are there. The need of the hour is to pick the good elements from both the bureaucracy and the NGOs and to involve them according to their suitable roles and capabilities. People's involvement at all levels, right from selection of schemes to implementation and monitoring, along with the bureaucracy and NGOs, will give good results, as has happened in Dumka in the Jal Hai Jan Hai scheme. The organised power of the poor should improve even the indifferent and corrupt bureaucracy and local government functionaries. The fact that the execution of JRY by the panchayats in Bihar is better than the execution of NREP and RLEGP by the bureaucracy earlier shows the potential of people's involvement in improving the management of poverty alleviation programmes.

Notes

- 1 For details of the backwardness of Bihar agriculture, see Sharma (1987).
- 2 Thirty-eight per cent of self-employed rural workers were below the poverty line in 1983.

4 According to an estimate, nearly three lakh agricultural labourers go to Punjab and Haryana every year, mostly from north Bihar districts for seasonal work. See Aye (1990). Also see Ghosh and Sharma (1990) for details of rural labour migration.

5 Apart from the present author, the other members of the study team were Pradhan, H. Prasad, Gerry Rodger and Shaibal Gupta.

6 Agriculture is much more important for Bihar compared to other states. The state has substantially higher proportion of people living in rural areas and dependent on agriculture for livelihood than India, on average as a whole. Agriculture's contribution to GDP in Bihar is also substantially higher compared to India as a whole and most of the states.

7 The functioning of the state government's irrigation department is a glaring example of the inefficiency and widespread corruption in the state. To give one instance, the tube well irrigation department with an investment of more than Rs 500 crore at current prices (in 1990) has become totally irrelevant. Their average cost of irrigation (five waterings) comes to over Rs 16,000 per hectare, which exceeds even the gross value of the output per hectare in the state. On the other hand, the per hectare irrigation cost for the private tube well is Rs 1,667 in the case of electric and Rs 2,404 in the case of diesel set. See Sharma (1991).

8 The state has not only a huge army of employees devoid of any rational consideration but they are the best paid in the country, even more than the central government employees, thanks to their organised trade union strength.

9 The ANSIS IIQ study had surveyed altogether six districts and 12 villages (two villages from each district). The total number of households covered were about 600. For details see Prasad et al. (1989).

10 The author derived this impression from discussion with several government officials.

11 Document of the Bihar Pradesh Kisan Sabha (BPKS) on the occasion of its Third Provincial Conference, August 28-30, 1980, Patna.

12 The occasional bulletins of the BPKS document these struggles. See various issues of *Kisan Samachar*, published by BPKS, Patna.

13 Interview with Kameshwari Prasad, general secretary, BPKS Bihar. Also see various bulletins of the *Kisan Samachar*.

14 Interview with general secretary, BPKS Bihar and secretary, BPKS Patna district. A couple of district magistrates also acknowledge the positive role of these organisations in this regard, though it is not very widespread as yet.

15 The description of this scheme is based on discussion with a couple of district officials (of Dumka) and a film 'Jal Hai Jiwan Hai' made by Anubhuti, a cultural organisation of Patna.

Selective Development and Widening Disparities in Gujarat

Indira Hirway

Gujarat is characterised by stark regional disparities in levels of development and poverty. Its tech-industrialisation in a few well-endowed areas has been coupled with neglect of the relatively backward areas. This selective path of development in the long run will put constraints on the growth of the state economy, which in turn will affect the poor adversely since they will not get enough employment. Any number of programmes of poverty eradication cannot compensate for lack of sustainable and healthy development of its economy.

I

Gujarat Economy: An Overview

GUJARAT, located in the western part of India, has a population of about 42 million (1991) spread over 196 million sq km. The state accounts for about 6 per cent of the total land mass of the country and less than 5 per cent of the population. The economy of Gujarat is peculiar in some ways. On one hand, it enjoys a relatively high level of per capita income (it ranks fourth among the states in India) has a relatively large share of the workforce engaged in non agricultural occupations (10.2 per cent against 32.6 per cent of all India) has a higher proportion of urban population (34.4 per cent against 23.3 per cent all India) and a fairly diversified industrial structure, while on the other hand has relatively poor and unevenly distributed natural resources, almost stagnant agriculture with widely fluctuating agricultural incomes and wide regional disparities of growth. It seems that the enterprising population of the state has worked hard to develop the economy, mainly in the areas with favourable natural conditions and with developed socio-economic infrastructures.

The overall performance of the state economy, as depicted in Table 1 shows that the state economy was growing at a faster rate than the national economy during the 1960s and 1970s with an average annual compound growth rate of SDP of 3.32 in the 1960s and 4.69 in the 1970s, against 3.19 and 3.42, respectively, for the national economy. However, the state rate declined to 4.37 in the 1980s while the national rate creased to 5.16. This deceleration in the growth rate in the 1980s in Gujarat seems to be largely due to the consecutive droughts from 1985-86 onwards, and to some extent due to the textile crisis in the state which resulted in the unemployment of more than one lakh workers directly (and many more indirectly), as well as the riots that broke out during the 1980s in many urban and some rural areas of the state. In the early 1990 also, the growth rate of the state economy (-0.37) is as much less than that of the national economy

A close look at the sectorwise performance of the Gujarat and national economies between 1970-71 and 1987-88 (Table 2) reveals that the major sector restricting the growth of the state economy is agriculture. While the performance of the state economy in the secondary and tertiary sector is comparable with the same of the national economy, the performance in the primary sector—and particularly in agriculture—is very poor. Table 3 shows that the performance of agriculture has been fluctuating greatly while the secondary sector—especially the registered secondary sector—has improved its performance consistently. The performance of the unregistered manufacturing sector has been low and unstable while tertiary sector has improved consistently.

An obvious consequence of the poor performance of agriculture is its declining share in the state domestic product. The share of the primary sector in the state domestic product has declined from 37.1 per cent in 1970-71 to 37.7 per cent in 1980-81 and to 29.9 per cent in 1988-89 while the share of the manufacturing sector has increased from 20.7 per cent in 1970-71 to 34.1 per cent in 1988-89 and of the tertiary sector from 32.5 per cent in 1970-71 to 36.0 per cent in 1988-89.

It must be noted that in spite of the poor performance of agriculture and the deceleration of the growth rate in the 1980s, the per capita income in Gujarat has been consistently higher than the same at the all India level. Gujarat still ranks fourth in the country, thanks to the performance of the manufacturing and the tertiary sectors.

LAND, WATER AND OTHER NATURAL RESOURCES

One major constraint on growth in Gujarat seems to be the poor endowments of natural resources, which are distributed highly unevenly and are managed highly inefficiently. Gujarat has an extreme climate, with hot summers and cold winters. The rainfall varies widely from 340 mm in west Kachchh to 1,800 mm in the southern hills in the Dangys; the average of the state is 800 mm. Two years in every five are drought

years (the CV percentage of average rainfall is 40%) in the state. In addition, the rainfall is concentrated in three to three and a half months, with the average number of rainy days between 30 in Kachchh and 40-45 in the south.

Except for rivers such as Narmada, Tapi, Mahi and Purna in the south, most rivers in Gujarat are small and seasonal. Due to the undulating terrain, the water in the rivers flows away very fast. The total ground water potential has been estimated at around 100,000 mm. The irrigation potential of the state (with Narmada) is estimated to cover a maximum of 40 per cent of the cultivated area and with Narmada, 50 per cent of the cultivated area. Of the total 18.83 million ha of land in the state, about 51 per cent is cultivated. Of the rest, 10 per cent (1.95 million ha) is under forests (more than half of the forest are degraded), 11 per cent (2.07 million ha) is barren and waste land, 1.6 million ha is low land, and 84 million ha open grazing land. Considering the fact that only about one-fourth of the cultivated land is irrigated and the rest rainfed land exposed to soil erosion during the major part of the year, it can be said that about 14 million ha of land, or 75 per cent of the total, is degraded in some way and needs protection.

The problem of uneven endowment of land and water resources in the state has become much more serious today because of the mismanagement of these resources over the years, resulting in severe environmental degradation in several regions. The major problem areas today are the desert and semi-desert areas of the north which are subjected to the danger of advancing deserts, the saline coastal areas of Saurashtra and the saline lands around the gulf of Kambhat with increasing salinity, declining vegetation and consequent soil erosion, and the eastern tribal belt from Sabarkantha in the north to the Dangys in the south, which is degraded due to deforestation and the consequent erosion of soil. Moreover, the mismanagement of irrigation water has created two problems in several other regions: the problem of waterlogging and

salinity due to the overuse of water in canal irrigated areas, and sinking underground water levels in well irrigated areas arising out of overdrafting of ground water. In short, poorly endowed Gujarat has mismanaged its land and water resources instead of using them judiciously, and has created severe environmental problems.

Gujarat does not have important minerals like iron, manganese, bauxite, coal, etc. However it has some low quality coal (lignite) in Kachchh and stone quarries in several parts of the state. Exploration for oil and natural gas has improved the state's position in minerals. It has also promoted development of several oil based industries in the state.

POPULATION

The annual compounded rate of growth of population in the state has declined consistently from 2.61 in 1961-71 to 2.47 in 1971-81 and to 1.91 in 1981-91. The rate was greater than the same at the all India level till 1981, but it has now fallen below the national rate. The crude birth rate has declined from 35.1 in 1979-81 to 29.2 in 1988-90, and the crude death rate from 12.4 to 9.8. Though Gujarat has a long way to go to reach Kerala's level of 1.00 gross reproduction rate, the recent results are encouraging (Table 4).

The share of the urban population has been consistently higher in the state compared to the all India level. In 1991 Gujarat had more than one-third of its population living in urban areas compared to 23.3 per cent at the all India level. Urbanisation in Gujarat is well spread out geographically, with about 260 urban centres in the state of which 19 have more than one lakh population.

The sex ratio in the state has consistently declined from 952 in 1951 to 940 in 1960 and to 934 in 1971. After an increase to 942 in 1981, it has again declined to 936 in 1991. Though this ratio is marginally higher than the all India ratio (929 in 1991), it is far below that of Kerala (1040 in 1991).

About 2.33 per cent of the country's SC population and 9.39 of the ST population live in Gujarat, and they constitute 7.15 per cent and 14.23 per cent of the total state population (1981), respectively. The growth of the SC/ST population has been faster than that of the total population. About 32 per cent of the SC population and 7.32 per cent of the ST population live in urban areas. The ST population resides mainly in the eastern hilly belt, while the SC population is more evenly spread out with some concentration in Saurashtra and north Gujarat.

SECTORAL DEVELOPMENT

Agriculture in Gujarat is highly commercialised. More than 45 per cent of the gross cropped area of the state is under cash crops, against the all India average of

24 per cent. The capitalistic growth pattern of agriculture is reflected in the relatively small proportion of small and marginal holdings and a large percentage of agricultural labourers in the total agricultural population. For example, small and marginal farmers constitute 49.03 per cent of the total holdings and 15.12 per cent of the total cultivated area, while at the all India level these percentages were 76.36 and 28.75, respectively. The average size of landholding in Gujarat is therefore larger (3.15 ha) than that at the all India level (1.68 ha). Also, the incidence of landlessness in Gujarat is one of the highest (71.5 per cent in 1983) in India.

In spite of the high level of commercialisation, agriculture in Gujarat is unstable and fluctuating. This is largely due to the low level of irrigation (about 25 per cent) and uncertain rainfall. The average annual agricultural growth rate was 2.27 in the 1960s, to 4.22 in the 1970s, and -3.9 in the 1980s (Table 3). Agricultural growth initially was possible through the extension of cultivation, while in the late 1960s and 1970s it was achieved through the new seed-fertiliser strategy, which benefitted only a few areas with good irrigation facilities. The frequent droughts in the 1980s were largely responsible for the decline in the growth rate.

The performance of the manufacturing sector in Gujarat has been consistently good in spite of the textile crisis. The annual average rate of growth of the sector increased from 3.04 per cent in the 1960s to 5.55 in the 1970s and to 8.11 in the 1980s. This growth, however, has certain characteristics which have implications for the poor. It is observed that growth in the registered factory sector in Gujarat has been high and consistently increasing, from 3.72 per cent in the 1960s to 10.06 per cent in the 1980s, while growth in the unorganised sector has been small and declining from 3.9 per cent in the 1970s to 2.4 per cent in the 1980s. The modern capital-intensive sector thus dominates the industrial growth in the state. However, while the number of factories in the state increased by about 234 per cent between 1961 and 1988, employment, increased only by 81 per cent, the compound annual growth rate of employment being 2.2 per cent between 1961 and 1988 and -0.3 per cent between 1981 and 1988. Though the share of the secondary sector in SDP increased from 24.8 per cent in 1960-61 to 34.1 per cent in 1988-89, its share in employment increased only marginally. Another important feature of industrial development is its concentration in the Vapi - Ahmedabad belt. About 60 per cent of the produce and about 75 per cent of the factory employment of the state comes from this belt, which runs along the railway line between Ahmedabad and Bombay. The other

smaller industrial centres outside the corridor are Rajkot, Morbi, Bhavnagar, etc.

Gujarat has experienced a rapid growth of small enterprises in industry and services. The average investment (1 asset) per unit here is about Rs 13 (1989-90) and average employment is 1.5 persons. The number of such units increased from 11.74 lakhs in 1980 to about 15 in 1990, implying a 27.17 per cent increase in the decade against the 16.63 per cent increase at the all India level. The employment in these units increased by 2 per cent. About 85 per cent of these are own account units employing less than two persons. About one-fourth of them are in agriculture (excluding crop cultivation) the rest are in the non-agricultural sector such as gems and jewelry, garment manufacturing, electrical and electro small engineering, as well as repairs, services and trading.

GROWING REGIONAL DISPARITIES

The above discussion makes clear that growth in the state has been mainly concentrated in a few regions. Because land and water resources in the state are distributed highly unevenly and agricultural growth was promoted mainly in areas favourably endowed with these resources, there are wide regional variations in agricultural development. Industrial development in the state has followed basically the colonial pattern, being concentrated in centres well connected with Bombay and Ahmedabad.

The government of Gujarat was always aware of these disparities. In 1970 a high level committee on balanced development of Gujarat was set up under Hathi, which identified 56 most backward talukas, of which 33 were selected for additional assistance of Rs 75 lakh. In 1978 a review committee was set up to assess the progress, but not much is known about their review. In 1983 another committee was set up for the development of backward areas under I G Patel which also identified 56 most backward talukas by using the composite index of backwardness. But once again, the government's action of giving one to two lakh rupees additional assistance per taluka was far from adequate. The net result is that regional disparities have increased in the state. The CMIE index of economic development for Gujarat state is 120 (all India = 100), but the Vapi - Gandhinagar corridor districts have a very high index (Gandhinagar - 307, Ahmedabad - 301, Baroda - 201) while the rest have a very low index (Dangs - 43, Panchmahals - 39, Banaskantha - 49 and Sabarkantha - 54). The industrial corridor of prosperous Gujarat has a low incidence of poverty which is half of the average for the rest of the state. About 60 per cent of the state's produce, including 35 per cent of the primary produce, 80 per cent of the secondary produce and 75 per cent of the factory employment in the state, is in this region. The rest of the state lags far behind in development.

CHANGING EMPLOYMENT SCENE

Absence of remunerative employment is the single most important factor responsible for poverty. Though all those unemployed are not poor, ensuring remunerative employment to the poor will go a long way towards alleviating poverty. It will be useful therefore to understand the main features of the employment scene in Gujarat and the changes that have been taken place in it.

Except for urban females workforce participation rates (WFPRs) in Gujarat are higher than those of all India. The WFPRs have also increased (though marginally) over the years, while they have declined at

the all India level. This implies that Gujarat has been enjoying a comfortable position regarding employment. At the projected WFPRs (by the Expert Committee on Population) the total labour force in the state is expected to rise from 155.55 lakh in 1990 to 180.29 lakh in 1995 and to 191.07 lakh in 2001.

It is observed that as in all of India, the rural workforce in Gujarat is less diversified than the urban workforce, and the female workforce is less diversified than the male workforce. In general, however, the Gujarat workforce is more diversified than the all India workforce. The NSS data (1987-88) given in Table 5 show this. In the case of rural Gujarat, secondary sector employment is growing faster than employment in the tertiary sector while at the all India level tertiary sector employment is growing faster. In urban areas, however, the trends are similar to the all India trends.

Gujarat has experienced a sharp reduction in the percentage share of self-employment in the total workforce in both rural and urban areas over the past two decades (Table 6). The percentage share of self-employed male workers declined from 65.6 in 1972-73 to 46.2 in 1987-88 (a 30 per cent decline) while the same in the female workforce declined from 69.4 to 40.2 (a 40.2 per cent decline). In the case of India, however, the decline is, at best, marginal. Gujarat has experienced a rapid increase in the share of casual labour, especially female labour. The percentage share of casual labour for females increased from 26.3 in 1972-73 to 55.3 in 1987-88 in rural areas and from 23.5 to 28.4 in urban areas during the same period. In the case of male labourers also, the

incidence has increased in Gujarat, resulting in a higher share of casual workers in both rural and urban area compared to all India.

The growth of employment in the organised sector has been low in Gujarat (as elsewhere) with the growth rate declining in the 1980s. Organised employment, which was 8.9 lakh in 1966, 14.40 lakh in 1980 (4.36 per cent increase per year) and 16.01 lakh in 1990 (0.11 per cent per year) is mainly concentrated in the unimised districts of the railway corridor from Mehsana to Vapi. The unemployment rates in general are higher at the all India level than in Gujarat. The low unemployment rates in Gujarat can have several implications, that the overall employment scene in Gujarat is better than

A NEW LIGHT SHINES ON THE MILLIONS IN RURAL INDIA.

LIC proudly introduces The Rural Group Life Insurance Schemes announced by our Honourable Prime Minister. LIC takes a significant step for a better tomorrow for the rural masses.

LIC introduces Rural Life Insurance Schemes through elected village Panchayats to provide insurance protection.

● Persons in the age group of 20 to 50 years are eligible.

● An assured sum of Rs. 5000/- shall become payable to the beneficiary upon death of member before 60 yrs. of age.

(a) General Scheme : Premium shall be payable in full by the member.

(b) Subsidised Scheme : One member from families living below stipulated poverty line shall be eligible by paying half of the total premium.

TABLE OF ANNUAL PREMIUMS

Type of Scheme	Entry age of member	Contribution by...		
		Member	Central Govt.	State Govt.
General Scheme	(1) Over 20 years to less than 40 years	Rs. 60/-	-	-
	(2) Over 40 years to less than 50 years	Rs. 70/-	-	-
Subsidised Scheme	(1) Over 20 years to less than 40 years	Rs. 30/-	Rs. 15/-	Rs. 15/-
	(2) Over 40 years to less than 50 years	Rs. 35/-	Rs. 17.50/-	Rs. 17.50/-

that at the all India level, or that the concepts of unemployment are not able to tap the real extent of unemployment due to the hidden nature of unemployment in the state. Since the Gujarat economy is relatively more commercialised, the second implication does not seem to be very relevant. One can therefore observe that the general availability of employment in the state is relatively high in Gujarat. The unemployment rates in the state, however, do not show any long term trend between 1972-73 and 1987-88, since the rates are generally fluctuating (see Table 7). A striking feature of unemployment in Gujarat is the high and increasing share of the educated and youth. The share of the educated among the unemployed increased from 51 per cent in 1970, to 57.4 per cent in 1980, to 62.3 per cent in 1990; and the majority of them were in the age group of 16-30 years.

II

Poverty in Gujarat

A number of methodological issues have been raised with respect to the estimates of poverty released by the Planning Commission. Several scholars have given alternative estimates, including estimates based on state level poverty lines. In order to examine the issues systematically and to arrive at reasonably accurate estimates of poverty in India, the Planning Commission had set up an expert group on poverty in 1989. Its report, which came in 1993, presents its estimates of poverty in India over time. For the 1950s, 1960s and 1970s, the trends in poverty in Gujarat have been estimated by Ahluwalia (1978), Murthy (1984) and Mahendra Dev et al (1990) (see Table 8). Though the three series give slightly different results, the following points come out clearly: (1) The incidence of poverty has increased in rural and urban Gujarat from the late 1950s to about the late 1960s or early 1970s. (2) The relatively high rate of growth of the Gujarat economy in the 1960s did not percolate down to the lower sections of the population to reduce the incidence of poverty. (3) For the later period (the 1970s and 1980s) we do not have any time series data on the incidence of poverty in the state. However, the five yearly surveys of the NSS and the estimates of the poverty based on these data are available (Table 8).

Table 9 presents official estimates of poverty in India and Gujarat. According to these estimates about 18.4 per cent of the people live below the poverty line in the state (1987-88). As per the estimates, the incidence of rural poverty declined sharply from 43.1 per cent in 1977-78, to 27.6 per cent in 1983, to 21.2 per cent in 1987-88, implying a 50 per cent reduction during the decade; while in the case of urban poverty the decline

was from 38.21 per cent in 1970-71 to 29.8 per cent in 1977-78, to 25.8 per cent in 1983 and to 12.9 per cent in 1987-88, implying a reduction of about 56 per cent during the decade. The rate of decline, however, declined between 1983 and 1987-88 in both rural and urban areas.

This positive picture, however, is not shared by all. Kakwani and Subbarao (1990) show a smaller decline up to 1983 (their estimates are up to 1983 only); while Minhas et al (1991) show a declining trend between 1970-71 and 1983 and an increase thereafter (from 36.32 in 1983 to 41.57 in 1987-88 in rural areas, and from 37.34 in 1983 to 38.8 in 1987-88 in urban areas). It is important to note that according to Minhas et al (1991), the all India poverty ratio declined throughout. Mahendra Dev et al (1992) also show an increasing incidence of rural poverty in Gujarat from 1983 to 1987-88.

According to the expert group on poverty, the incidence of poverty in the state declined much faster during 1973-74 to 1983 (from 47.21 to 33.27 - 3.2 per cent decline per year) than during 1983 to 1987-88 (33.27 to 32.33 - 0.28 per cent decline per year). The decline in the later period is only marginal in nature, and in fact, there was an increase in the absolute number of the poor in the state by eight lakh during this period (6.5 per cent). It should be noted that the decline in the state is much higher than that in India in the former period, while it is much lower than that in India during the later period.

An important feature of poverty in Gujarat is its fluctuating nature. The time series data on poverty, which are available only for the early years (up to the early 1970s), show that the incidence of poverty in both rural and urban areas fluctuates widely from year to year, depending on the rainfall and the agricultural season. For later periods time series data are not available and consequently we do not have much information about fluctuations.

The incidence of poverty in the state is unevenly distributed among various social groups. It is much higher among the scheduled castes and tribes than in the general population, the incidence among scheduled

tribes being double that of the general incidence in the state (Table 10). The planning department of the government of Gujarat estimated the population belonging to the target groups for the purpose of poverty alleviation programmes in the early 1980s. We have revised these estimates based on the 1991 census data as well as the 1986-87 agricultural census data (Table 11). The data show that the major poor groups in rural areas are (a) those belonging to ST, SC and other backward castes, and (b) agricultural labourers, rural artisans and marginal farmers. The rural SC/ST/BC population belonging to labour households (42 per cent of the poor) are the poorest group, followed by marginal and small farmers belonging to SC/ST/BC (27.5 per cent of the poor), the other labour households, and marginal farmers and rural artisans. The severity of poverty is highest among rural labour households (as per the Sen Poverty Index), and non-agricultural rural labour households are the worst affected among them. That is, casual labour looking for unskilled work in non-agricultural sectors and getting scattered and intermittent work are among the poorest groups in the state. (Table 12).

REGIONAL DIMENSION OF POVERTY

We have three sets of data on regional poverty in the state namely, the study by GVSN Murthy on districtwise variations in poverty in Gujarat in 1972-73, the estimates of poverty prepared by the Bureau of Economics and Statistics for the Eighth Plan based on the NSS data, 1983, and the statistics on poverty in different agro-climatic zones in Gujarat prepared by the Agro Climatic Zonal Planning Cell of the Planning Commission for the late 1980s. (Table 13). Though these three sets of data are not strictly comparable, they do indicate the wide and increasing regional disparities in poverty in the state.

The coefficient of regional variations in the incidence of poverty increased from 0.3274 in the 1960s to 0.4387 in the early 1980s, to 0.5629 in the late 1980s. These widening variations are linked to the wide

TABLE 7: CHRONIC UNEMPLOYMENT RATES IN GUJARAT AND INDIA

regional variations in development. The development process has neglected backward and remote areas, with the result that these areas have degraded environments and poor infrastructures. The eastern tribal belt is the worst affected among these, and the region has become poorer over the years.

The increase in the incidence of poverty in rural and urban Gujarat in the 1960s can be largely attributed to the poor trickling down of economic growth. A major factor responsible for this was perhaps the weak infrastructural base and the highly selective nature of the initial growth in the state. The decline in the incidence of poverty thereafter up to 1983, is explained by Kakwani and Subbarao (1990) as well as by Jain and Tendulkar (1990). According to the latter, the decline during 1970-71 to 1983 was largely due to the growth of the state economy and marginally due to distributional changes. The population growth in the state tended to increase the incidence, but the other two factors dominated over it. Kakwani and Subbarao, however, give more

credit to anti-poverty programmes which started in 1971-72 but were intensified from the late 1970s. They argue that the reduction in the incidence of poverty in the state during the period was largely attainable due to the anti-poverty programmes in the state.

The phenomenon of stagnant or marginally declining incidence of poverty between 1983 and 1987-88 is not easy to explain. One major reason was perhaps the negative growth rate of agriculture during the 1980s which was, to some extent, a result of the three consecutive drought years. Considering the fact that droughts are a fairly regular feature in Gujarat, one can say that the decline in poverty, and especially in rural poverty, cannot be achieved in a significant and sustainable fashion until droughts are controlled by proper environmental protection works. The environmental degradation during the last few decades has indeed intensified the effects of drought on the economy as well as on the poor. The other factors that could have contributed to the lack of decline in the incidence of poverty

in the 1980s especially the urban poverty seem to be the crisis in the textile industry which left more than one lakh worker unemployed directly and many more indirectly; and to some extent the communal riots of the 1980s which disturbed most urban centres and some rural areas in the state. Another causal factor seems to be the widening regional disparities in the incidence of poverty, with the poor areas getting poorer. This is to an extent reflected in the high average incidence of poverty in the state.

What has been the role of the labour market in influencing the incidence of poverty? Since rising wage rates and rising employment can raise the income levels of the poor, it is important to examine this. The compound rate of growth of person days of employment in Gujarat has been 1 per cent during 1972-73 to 1983, which is far less than the rate in Haryana (3.56 per cent), Andhra Pradesh (2.16 per cent), West Bengal (1.51 per cent) or Karnataka (1.30 per cent). Also, the rate of increase in the real rural wage rate has been low (0.37 per cent) between 1971-7

and 1983-84. The rank of the state is as low as 10th among the major states in the country. A study by this author on the enforcement of minimum wages in agriculture in Gujarat has shown that the agricultural labour market has undergone several structural changes in the recent past which are likely to work against the interests of agricultural labourers: the segmentation of the labour market between local and migrant workers; declining permanent/seasonal employment in agriculture; casualisation and contractualisation of employment; and expansion of share cropping. In short, the functioning of the market for rural labour does not seem to have helped the poor in any significant way. Though some rural labourers in prosperous pockets have benefited from the expansion of employment opportunities and rising wage rates, the overall picture is not very favourable.

NON-CALORIE INDICATORS OF POVERTY

Measurement of poverty on the basis of income/consumption levels tells us only part of the story, as it does not give any information about the quality of life enjoyed by people – which is the ultimate goal of poverty alleviation. We have therefore presented some indicators of quality of life along with the rank of Gujarat among the major states in the country, the rank of Kerala (which is at the top in non-calorie indicators of poverty), and the all India averages.

The major variables considered in health and demography are the life expectancy at birth, infant mortality rate, sex ratio, crude death rate and crude birth rate. We have also presented data on per capita expenditure on health. Table 14 shows that though the state ranked fourth in per capita expenditure on health from 1976-77 to 1986-87, it ranks quite low in basic health characteristics. It ranks ninth in infant mortality rate (inverse ranking), eighth and ninth in birth rate and death rate (inverse ranking), respectively, and eighth in life expectancy at birth. Though Gujarat is slightly above the all India level it is far behind Kerala in all these parameters.

Gujarat stands fourth among the major states in general literacy (1991). However, it stands sixth in female literacy, and seventh and eighth in the enrolment of girls in standards one through five and dropout rates of girls (inverse ranking), respectively. However, the state, once again, stands fourth in per capita expenditure on education from 1976-77 to 1987-88 (Table 14). The limited data available on the ST and SC populations show that they have a much lower quality of life: their literacy rates are much lower (30 for ST, 53 for SC, against 65 for the total population), and their female literacy rates are extremely poor (12 for ST, 26 for SC, against 38 for the total population).

On the whole, Gujarat ranks fairly low (seventh) in the non-calorie indicators of poverty, in spite of the fact that it stands fourth in per capita expenditure on health and education. This is perhaps because the expenditure is highly unevenly distributed among rural and urban areas, developed and backward areas and among the poor and non-poor sections of the population. To sum up, the overall picture with regard to non-calorie indicators of poverty is not very bright. This is confirmed by the study by Vyas and Vidyasagar (1991), which ranks Gujarat eighth among the states in India with respect to HDI (human development index).

III

Poverty Alleviation Efforts

Poverty alleviation has been an important objective of development planning in Gujarat (as in India), right from the inception of planning. The strategies, however, have changed over time. In the initial phase the focus was on organisational and institutional changes, decentralised development redistribution of assets, and sectoral development. Community development programme, panchayati raj, land reforms, etc. were tried out, not very successfully, and efforts were made to raise the rate of growth of the economy. In the late 1960s and early 1970s, however, the strategy of direct attack on poverty was introduced to serve the poor directly. Though the strategy began in a modest way, it expanded in terms of coverage and content over the years to cover the entire state and almost all the socio-economic groups of the poor. The strategy also covers

all the major sectors of the economy and offers self and wage employment, skill formation, as well as minimum needs, welfare, social security, etc. to the poor. Being 'progressive' Gujarat government has initiated several additional programmes of its own. There are as many as 97 programmes of the central and state governments, with some of them directed at poverty alleviation. Some of these programmes are discussed below.

SELF-EMPLOYMENT PROGRAMMES

IRDP, the main self employment programme, was extended to all the blocks in the state in the Sixth Plan. In this plan, 7.10 lakh persons were assisted under IRDP of whom 0.80 lakh belonged to the SCs and 1.78 lakh belonged to the STs. In the Seventh Plan the second dose of assistance was given to about 1.42 lakh beneficiaries in addition to 4.80 lakh new beneficiaries. Thus during

2 World Bank.

the Sixth and Seventh Plans about 11.90 lakh persons got the benefit of IRDP out of the total 31.42 lakh poor households in the state. Of these, 39 per cent belonged to the SC/ST against the target of 30 per cent, and 23 per cent were women against the target of 40 per cent. If we assume that 11.90 lakh households received benefits (ignoring the fact that some families had more than one beneficiary), we can say that 37.8 per cent of the poor received IRDP assistance during the two plans. The total funds invested for these beneficiaries during 1980-1990 was about Rs 19,064.20 lakh or including credit Rs 46,950.5 lakh, that is, Rs 3,945 per family.

The concurrent evaluations of IRDP carried out by the Institute of Rural Management, Anand, show that about 89 per cent of the beneficiaries in Gujarat had their investments fully operational and intact after two years, as against 71 per cent at the all India level. Of these, about 43 per cent had repaid the loans fully, against 29 per cent at the all India level. The performance of the programme in terms of enabling the beneficiaries to cross the poverty line, however, was quite poor in the state, with only 4 per cent of the eligible beneficiaries crossing the poverty line compared to 7 per cent at the all India level. This implies that (a) the increase in incomes achieved by IRDP beneficiaries was not large enough to bring the beneficiaries above the poverty line (the investment per beneficiary was Rs 3,945 against the all India Rs 5,093 (1988) or against the required investment, as estimated by the PAC, of Rs 10,000), and (b) the schemes could not work well in the long run to lift beneficiaries above the poverty line. Consequently, with an investment of about Rs 469.5 crore, only 0.52 lakh beneficiaries could be brought above the poverty line. This success is small as well as expensive. It must be added that many more beneficiaries experienced an increase in their incomes through IRDP.

In addition, IRDP performed well mostly in developed and prosperous areas and performed badly in backward and remote areas. Also, it assisted some among the non-poor, this leakage being about 20-30 per cent. Studies have shown that IRDP benefited those poor more who were nearer to the poverty line and left out the poor at the bottom, either by keeping them out or by allowing them only petty small schemes. In general, women have benefited less from IRDP and female headed households have had poorest access to it.

The limited success of IRDP has been traced to the following factors by several scholars:

(1) The IRDP approach is not rated as sound for the purpose of sustained poverty alleviation, first, because it is isolated from the main growth process in terms of resource allocation, technology and sectoral

development, second, because it over-emphasises self-employment expecting the poorest of the poor, who neither have the capacity nor the credit-worthiness, to undertake self-employment, and third, because it is primarily treated as a soft option by the officials to provide the poor with some kind of temporary relief through a subsidised asset.

(2) Another major weakness of IRDP is its weak planning. Though it was to be a comprehensive strategy for translating the objectives of rural development (social justice, full employment at increased productivity for the rural sector within 10 year frame) it got reduced to a limited approach of creating self employment opportunities for the poor. The concept of integration was shot down, and in spite of the cluster approach, household approach, credit plans, district level committees etc., the programme could not be integrated with the development process. In addition, there were other problems like poor co-ordination with other programmes, multiplicity of agencies and lacunae in the design of the economics of IRDP schemes.

(3) Inadequate infrastructural support. In spite of the repeated emphasis laid on the need for infrastructural support in finance and credit, marketing, raw materials, training, technical assistance and follow up, it could not be provided satisfactorily, especially in backward and remote areas.

(4) Administrative and organisational problems. Too much bureaucratisation, limited scope for involving people in planning and implementation, too much centralisation, problems of co-ordination (mainly horizontal), temporary nature of DRDAs, limited faith of the administration in the programmes and inefficiencies and corruption at all levels have been the major administrative problems of the programme.

DWCRA

The Development of Women and Child in Rural Areas Scheme was initially introduced in Ahmedabad and Junagadh districts. Today it covers 11 districts and is

expected to cover all the districts by the end of the Eighth Plan. The programme has done fairly well in the state, about 1,172 groups of poor women have been formed (1990), and a large part of the allotted money has already been spent. However, the performance cannot be rated as successful [Hirway and Unni 1991], first because not a single one of the 1,172 groups has so far become self-reliant to manage itself independently. Second, the majority of the groups are still inactive with about 40 per cent in the formation stage and only about 30 per cent of the rest in the production stage. Only half of this 30 per cent (about 10 per cent of the total) have reached the break-even level of business. Third, most groups have selected traditional activities such as tailoring, garment making, food processing, animal husbandry, etc., and only a few have taken up non-traditional activities.

The major reasons for this less than satisfactory performance are weaknesses in programme design as well as organisation and administrative problems.

(1) The first major design weakness is reliance on blanket guidelines rather than project approach. The blanket guidelines regarding financial needs, training expenditure, etc. are too rigid to meet micro-level needs. Second, the assumption that 1 to 15 poor village women, most of whom are illiterate, ignorant and tradition-bound, can be made capable of running a successful business within three to five years, is highly unrealistic. Experience has shown that this is not a feasible goal unless the groups are backed by really capable agencies. Third, the programme does not realise that the poor, general and poor women in particular, lack the willingness or ability to take risks to run an enterprise as they prefer fixed wages rather than fluctuating and uncertain profit. They are therefore not very enthusiastic about taking up an enterprise.

(2) At the implementational level, it was observed that the two major supports for women, namely, child care and technology for reducing drudgery, which were important components of DWCRA, were more or less

TABLE 12. SEVERITY AND INCIDENCE OF POVERTY AMONG DIFFERENT SECTORS (1983)

ignored in practice. Moreover, there were serious qualitative drawbacks in training, difficulties in marketing their products, and problems of getting adequate credit. The group philosophy as well as the concept of a co-operative society could not be implemented successfully in reality. And last, the petty and scattered economic activities frequently selected for DWCRAs were without any strong linkages with the local economy, with the result that it was difficult to sustain them. The voluntary agencies involved were also not really prepared for this new role. Though some of them were genuine and committed, they lacked the professional expertise and experience to stand in the market successfully.

TRYSEM

TRYSEM started as an independent training programme to promote self employment among youth belonging to poor households. At present it is a part of IRDP and is designed to promote self employment for IRDP beneficiaries as well as skilled wage employment. Gujarat spent about Rs 1,660 lakh on TRYSEM between 1980 and 1990 of which 21 per cent was spent on infrastructural facilities. Initially the employment of trainees was very poor but after TRYSEM was integrated with IRDP more than 50 per cent of the trained youth got self or wage employment though not all got work in the trade in which they were trained. In order to improve the performance of TRYSEM the following steps are needed:

(1) TRYSEM should be linked with the industrial policy and with the (rural) industrialisation process in order to identify the right trades for the youth.

(2) Since about 80 per cent of the chronically unemployed in Gujarat are youths (15-29 years) many of whom are educated their TRYSEM training should be related to their capacity, entrepreneurial aptitudes, and to the demand, in order to tap this potential resource. The programme should not be treated as temporary employment for getting a stipend.

(3) TRYSEM should be used as a programme for imparting modern non farm skills to meet the needs of the growing non farm sector in the state. It should thus support the mainstream industrialisation process and not the informal residual sector with petty economic activities.

PUBLIC WORKS/WAGE EMPLOYMENT PROGRAMMES

Public works programmes, which come second in poverty alleviation programmes, are NREP and RLEGP (in the 1980s) and JRY (since 1989-90).

NREP/RLEGP

About Rs 27,017.78 lakh were spent on NREP/RLEGP to create 1,444.25 lakh

mandays of employment (cost per manday - approximately Rs 18). The impact of these programmes was small as the total employment generated came to full employment for about 22 per cent of the poor, or 100 days of work for about 5.9 per cent of the poor. Although the official targets of the programmes declined, they could not make any significant impact on the incidence of unemployment in the state or in the generation of durable assets though there has been construction of assets such as irrigation works, school rooms, housing for the poor, and construction of latrines.

The primary objective of employment generation has been neglected in favour of construction of buildings such as panchayat ghar, cultural centres, housing etc. Consequently the (unskilled) employment generated in the construction and post construction phases has been less than desired. Works such as soil conservation, watershed development and afforestation which are (unskilled) labour-intensive in the construction and post construction phases are relatively neglected [Hirway and Terhal 1993].

There is almost an absence of a long run perspective in the programme guidelines which fails to reflect the long term economic logic that the programmes are meant to use surplus manpower for the generation of assets that expand the labour absorbing capacity of the mainstream. As a result not much attention is paid to long term consequences in selecting works under the programme. Consequently employment generation per person has been intermittent and small (around 30 days per beneficiary in a year). Since the stipulated minimum wages were not paid in more than 60 per cent of the cases the average wages received by beneficiaries have not made much impact on their levels of living savings or on asset holdings [Hirway and Terhal 1993].

In regard to the assets, the quality was found to be less than satisfactory with one fourth of the assets being non-durable, 40 per cent assets being of medium to poor technical quality and 31 per cent not maintained well [Hirway and Terhal 1993]. The use and distribution of assets tended to benefit the non-poor, because selections were made keeping in mind the interests of the non-poor, and community assets like school rooms and hospitals were not much used by the poor. A gradual shift, however, was seen in the pattern of allocation of resources of the programmes in favour of afforestation and irrigation and away from the construction of buildings during the late 1980s. Unfortunately, this shift did not continue in JRY, which followed NREP and RLEGP. Also, the pockets where the programmes were implemented intensively showed (a) increase in the local unskilled wage rate, (b) increased wage incomes of the workers

that reduced their debts to the local moneylenders and helped them in buying productive assets and (c) reduced out migration of workers. In addition the involvement of several voluntary organisations in environmental works resulted in expanded employment opportunities in the mainstream economy. The qualitatively better performance of the voluntary agencies provide some lessons for the implementation of the programmes.

JRY

The main objectives of JRY which replaced the earlier programmes were to provide employment of 100 days to at least one member of each family of rural landless households and to construct durable community assets. Some new features of JRY are: (a) it is planned and implemented mainly through village panchayats; (b) it covers every village of the country; and (c) the village assembly is expected to control

Note: Figures in brackets indicate rank of Gujarat among the major states of India.

Our challenge in life is but one – to get ahead of our own selves, to break our own records, to outstrip our yesterday by our today.

When it comes to banking, SBI sets the pace every year. To break its own past records. Take into consideration the profits for the year 1994-95 Rs 715 crores. That's 160% growth over those of 1993-'94. Deposits of Rs 85,000 crores. A loan portfolio of Rs 49,000 crores. A Capital Adequacy Ratio of 12.77%. A network of over 8,700 branches in India. And the impressive growth of all our associate banks and subsidiaries.

Euromoney – Europe's leading financial magazine voted SBI India's best domestic Bank. Second year in a row.

And Asiamoney – Rated it as the seventh best managed Company in India. Which just goes to prove one thing. Each year we put our own past performance in the shade.

State Bank of India

A leap year performance. Every year.

the use of funds by the panchayat. The Gujarat government spent about Rs 156 crore on JRY in the first two years, which generated about 3.90 crore mandays of employment. Village panchayats took up mainly assets such as housing, panchayat buildings, irrigation wells, school rooms, etc, and spent only 6 per cent of the funds on land and water conservation programmes. Since the JRY funds are limited, they are spread too thinly over all the villages (about 60 per cent of the village panchayats in Gujarat receive less than Rs 25,000 per year), resulting in low and intermittent employment for the poor. Most village panchayats treat JRY mainly as an extra source of income to undertake their activities and not as a programme meant to generate employment and assets for the poor. The primary focus of the programme therefore seems to be on construction of assets. Also, the idea of social audit by the village assembly does not work in reality because the village assembly is usually very weak. On the whole, therefore, JRY does not appear to be an improvement over the earlier programmes. On the positive side, it should be mentioned that it gave village panchayats training in planning local works.

Special employment programme

The special employment programme, introduced by the state government in 1990-91, has three components: self employment generation, vocational training, and generation of wage employment. The programme started with the zero unemployment programme in the two smallest districts, viz., Gandhinagar and Dangs and added the minimum unemployment programme in 34 talukas and the village level scheme in 184 villages.

The objective of the zero unemployment programme was to remove unemployment by providing self and wage employment under the ongoing programmes as well as the departmental programmes of DET, industries department, public works department, etc. In Gandhinagar 12,000 families were given self employment (including 4,000 under vocational training), and 4,000 families were selected for wage employment. In Dangs, however, 14,000 families were selected for self employment and the rest for wage employment. Though no systematic evaluation has been done of the programme, the data indicate that the

programme had not reduced unemployment to zero by the end of 1991-92. The government is now finding it difficult to sustain the level of wage employment created in the districts for lack of funds. The government therefore initiated the minimum unemployment scheme in 1991-92 in 34 talukas of the state, with the term 'minimum' defined very vaguely. Rs 2.4 crore allotted for the generation of self employment and Rs 1.03 crore for wage employment under the programme was far from adequate to minimise unemployment in the selected talukas, as it came to a mere 1000 mandays of wage employment and about 141 of self employment per taluka at the rate of Rs 5,000 subsidy or Rs 10,000 investment per family. In short, the special employment programme is not supported by adequate funds.

AREA DEVELOPMENT PROGRAMMES

The major area development programmes implemented in Gujarat are Drought Prone Area Programme (DPAP), Desert Development Programme (DDP), and Tribal Sub Plan (TSP) which, respectively, cover 43 blocks, nine blocks and 32 blocks and 19 pockets of the state. DPAP covers about 35 per cent of the area and 24 per cent of the population of the state. DDP, on the other hand, covers about 6 per cent of the area and 4.5 per cent of the population. The major objectives of these programmes are to conserve, develop and harness land and other natural resources for ecological regeneration; to minimise the adverse effects of drought on crops and livestock through an integrated approach; and to contribute to drought proofing. The activities are to be planned under a comprehensive watershed approach.

Between 1981 and 1990 about Rs 1,072.46 lakh was spent on these programmes in the state. DPAP has so far covered about 8,000 ha under irrigation, 52,000 ha under soil conservation and about 45,000 ha under afforestation, which comes to a mere 1.6 per cent of the total area covered under DPAP. DDP has covered about 3,100 ha under minor irrigation, 12,500 ha under afforestation/pastures and 5,100 ha under soil conservation during the decade. Though there is an emphasis on comprehensive watershed development, the programmes have been largely isolated in nature. This is perhaps because of poor administrative co-ordination

among the concerned departments, which have strong vertical linkages but poor horizontal communication. The scarcity works, which are undertaken almost regularly, in the state, are implemented independently by the revenue department under the scarcity manual. Efforts to co-ordinate these works with these programmes have not been successful so far.

The Tribal Sub Plan in Gujarat covers 32 talukas and 15 pockets of the tribal belt and is spread over about 14.41 per cent of the area and 81 per cent of the tribal population of the state. The tribal belt has been divided into nine project areas under the TSP. The main components of the TSP strategy are identifying blocks where the tribal population is in the majority; preparing integrated development projects for the development of the blocks; earmarking funds for the same under TSP; and creating appropriate administrative structures for it. The TSP has two major thrusts, namely, socio-economic development of tribal areas and of tribal families. Project officers prepare development projects for their blocks and implement them with the assistance of the staff. TSP also receives specified shares from the funds from IRDP, JRY, DPAP, etc. About Rs 11,502 lakh were spent under TSP in the state during the past decade. However, the increasing incidence of poverty among tribals and the environmental degradation of the region suggest that the TSP has not been very effective.

Historically speaking, tribals enjoyed the right to forests and forest lands before the British came to India. With the nationalisation of forests under the Indian Forest Act during British rule, they lost their collective or individual ownership of forests, and became subject to administrative control by the forest department. Some tribal areas were invaded by Rajputs who set up princely states in the forests and made tribals their subordinates. In the post-independence period irrigation policy (big dams), industrial policy as well as mining operations proved catastrophic to the tribal economy, because these policies either threw them out of the forests (with meager compensation if any at all) or deprived them of the occupations that provided them their livelihood. In other words, the relationship between tribals and their surroundings gradually became exploitative. It is clear that any programme that aims to

TABLE 15: EXPENDITURE ON SOCIAL SERVICES IN GUJARAT

help tribals must give due consideration to these facts

Unfortunately neither TSP nor tribal development policy in general addresses these factors. What is needed is leasing of forest land to tribals for plantation of trees giving them rights to minor forest produce and good remuneration for collection of forest produce and special attention to infrastructural development and environmental protection of tribal areas. TSP in Gujarat has proved to be less than satisfactory in this context. In addition there are other development programmes such as that for coastal saline regions of the state (covering 549 villages of 39 talukas) a programme for the ten most backward pockets (Khakharia Tappa Bhal area Ghed area Nalkantha) and a programme for the 56 most backward talukas identified by the I G Patel committee. These special programmes are important from the point of view of area development but the investments made are too small to make much impact on backwardness.

SOCIAL SERVICES

Social services can contribute to the labour market prospects of low income wage earners and enhance their productivity as well as provide them good health, adequate nutrition and educational achievements. The total expenditure on social services in Gujarat increased from Rs 29 crore during the Second Plan to almost Rs 1 500 crore during the Seventh Plan. In terms of the percentage share of the expenditure on social services, however, there is no clear increase (Table 15). Education has remained the most important component of social services followed by health. The importance of social welfare and social security services has also increased over the years.

The state government has introduced several innovative programmes and schemes for promoting the welfare of the poor. A striking feature of the performance of these programmes and schemes, however, is their low levels of coverage and expenditure. For example, the group insurance scheme covered around 70 000 agricultural labourers (of 30 lakh total) in the last seven years and less than 25 000 agricultural labourers have received benefits. Similarly, about 260 forest labourers have received benefits of the group insurance scheme during 1983 to 1991. The old age pension scheme for agricultural labourers has covered less than 10 000 labourers till 1987 (when the scheme was under the rural labour commissioner), and around 55 000 thereafter when the scheme expanded its coverage to include disabled persons and widows. The maternity benefit scheme for agricultural labourers has

covered around 11,000 women out of the total 12 lakh female agricultural labourers.

The welfare programmes show a similar performance in spite of the innovative step of setting up separate rural workers' welfare centres in the state. The total expenditure of the board is less than Rs 30 lakh (till 1989-90) per year and its 150 centres provide benefits to less than 25 000 rural workers. It is worth noting that we are not referring to the qualitative impact of the centres, which is also less than satisfactory according to our evaluation study.

The government of Gujarat has set up a separate rural labour commissionerate for enforcement of labour laws for rural workers. However, the performance has been very poor. About 54 635 labourers were helped in reimbursement of their wages in nine years (1981-89) the average reimbursement being Rs 343. There has been a drastic reduction in the number of these beneficiaries in recent years.

The innovative public distribution schemes as well as the mobile vans to provide essential commodities in remote areas have done well in terms of serving rural areas (Table 16) but there are wide regional variations in the availability of foodgrains across the state.

To sum up, though Gujarat has made additional efforts to help the poor by introducing innovative programmes and schemes, the scale of their operation is quite small. Though a few of the programmes (like the PDS) have made some impact, the rest of the programmes appear to be mainly for display. It appears that the whole approach to empowering the poor lacks political commitment by the leadership. Commercial considerations and the capitalist interests of the major power lobbies in Gujarat do not really allow for any strong pro-poor measures in the state.

IV Relevant Institutions and Organisations

Gujarat has several organisations and institutions which, in some way or other are believed to be capable of taking up the cause of the poor. These are panchayati raj institutions, decentralised planning, co-operatives and voluntary organisations. All are believed to be fairly successful in promoting the interests of the poor. Below we attempt to assess their strengths.

PANCHAYATI RAJ INSTITUTIONS

Panchayati raj (PR) institutions in Gujarat are believed to be fairly successful in bringing about democratic decentralisation in planning and implementation. The progressive leadership of panchayat bodies are believed to be capable of taking care of the interests of the poor. Several studies have, however, shown that this is not really correct.

On the positive side, it may be noted that Gujarat passed the Panchayat Act in 1963 and set up a three tier PR structure covering the village, taluka and district levels. Recently, the state has passed a new act as per the constitutional amendment. Panchayat elections are held fairly regularly. Several panchayat leaders are visible, vocal and considered to be important in Gujarat's politics. In spite of this, the panchayats have not been effective in helping the poor because PR bodies are not given much power in development planning. Their finances, which come from grants, a few local taxes, some donations and 'lok talo' (people's contribution), are inadequate to enable them to undertake minimum tasks in their villages. Moreover, most of the rural development work is carried out by the development administration and PR bodies have a limited say in these programmes.

Given the socio-economic structure of rural society, most office bearers of PR bodies are from the rich class who do not represent the interests of the poor. The office bearers of many panchayats are enterprising capitalists who pursue their private interests by undertaking diverse economic activities that largely serve the interests of the rural elite. They use their political and financial powers to serve their own interests and their activities, if at all, help the poor in an incidental fashion.

DECENTRALISED PLANNING THROUGH DISTRICT PLANNING BOARDS

Gujarat is known for its pioneering move in the field of district planning, which was introduced in 1978 and was modified in 1980 following the recommendations of a state level committee. The modified district planning was expected to fill in the gaps in the minimum infrastructure in the district and promote employment generation in general. The district planning board (DPB) in each district is headed by a state minister, with the president of district panchayat as the vice chairman and the collector as the executive vice chairman. The other members are elected representatives, government officials, and other non-officials. About 35 per cent of the state plan outlay at the district level is allotted to the DPB. Of this, 80 per cent is for normal development schemes, 15 per cent for special DPB schemes and 5 per cent is under the incentive provision. This was a good beginning 12 years ago, but the lack of progress is not at all a positive development.

The DPBs spent Rs 349 crore between 1980 and 1991 on about one lakh small and big works. The share of untied outlays at the district level was 11 per cent during 1985-90, which declined to 6-8 per cent thereafter. Planning at the district level thus is still very limited. The district planning model has indeed failed to fulfil expectations.

One reason for this is the unwillingness of politicians as well as bureaucrats to share power with people at the district level. Real decentralisation of decision-making will not go beyond the present limits as long as this unwillingness persists. The recent decision to provide Rs 10 lakh per year to each MLA to promote development in his/her constituency is not likely to strengthen the process of decentralised planning. In fact, such a provision for MLAs (and not for panchayat bodies) merely reflects the political strength of MLAs in the power game at Gandhinagar.

CO-OPERATIVE MOVEMENT

The co-operative movement in Gujarat is believed to be fairly successful; its success in the dairy industry is almost legendary. Though co-operatives are not meant only for

the poor, co-operatives in production, distribution and marketing, credit and banking as well as in the consumer movement, can be utilised effectively to help the poor. The basic philosophy of the co-operative movement – that the strength of a group is superior to that of an individual – can be very relevant to making the poor viable.

Co-operatives in Gujarat cover agricultural and non-agricultural credit societies, dairy co-operatives, marketing and service co-operatives, co-operatives in fishery, poultry, handloom, handicrafts, housing, consumers and others. They are well spread across sectors and regions of the economy. Today there are 49,945 co-operatives in the state, with 919 million members and Rs 3,894 million share capital. They have a total working capital of Rs 6,891 crore (1986-87) and advances of Rs 2,942 crore (1986-87). This is indeed quite substantial in an economy where the total developmental and non-developmental budgetary expenditure of the government is about Rs 4,753 crore (1989-90).

The Amul model of dairy co-operative is unique in that it links primary milk producers with modern dairy farming technology. Today there is at least one large dairy in each of the major districts of the state, which are well supported by a network of primary milk co-operatives spread over thousands of villages. Since the milch animal scheme under pro-poor programmes is given only to members of primary milk co-operatives, the dairy network has helped the poor considerably. However, the co-operative form of production, also recommended and tried outside the milk sector, has not always met with success. A co-operative society is said to be successful when (a) it is financially viable; (b) it is self-governed by the members; (c) it adheres to the basic principles of co-operation such as voluntary membership, democratic control, and fair distribution of profits; and (d) it grows. Unfortunately, not all co-operatives, especially the co-operatives of small producers belonging to the weaker sections, have the capacity to function in this way. Studies have shown that a cooperative succeeds when it is able to compete with others in the market; where it has access to credit, raw materials and other services; when it adopts new and profitable technology; and when it is managed well. All this happens when the leadership is capable. Co-operatives in Gujarat therefore have succeeded in some sectors and regions, but failed in many others.

VOLUNTARY ORGANISATIONS

Voluntary organisations in Gujarat can be broadly divided into four groups: (1) purely welfare organisations for children, handicapped women, destitutes, etc; (2) those involved in social services such as health, education, nutrition, etc; (3) development

organisations aiming at enhancing incomes, employment and levels of living of the poor; and (4) organisations aimed at empowering the poor. The voluntary sector in Gujarat is relatively large mainly due to the old cultural tradition of charity organisations in Gujarat, the influence of Gandhiji and Gandhians who initiated constructive work in several parts of the state, and the contribution of industrial houses in the field of developmental and welfare activities. Several professionals and educated youth have also taken to voluntary work in the state in the last decade or so. In addition, several small self-help organisations have come up in the state purely through local efforts.

The major characteristics of these organisations are: (1) Most of them are operating at the local level covering five to 10 villages or even less, and only some are operating on a large scale. (2) There have been a gradual increase in professionalism in voluntary organisations in general. Use of modern science and technology, participative organisational structure, use of modern communication methods, scientifically designed training programmes, training of trainers programmes and overall professional management are some of the new features of these organisations. (3) Innovations and experimentation are visible in the working of several voluntary organisations. Construction of lined ponds for drinking water in saline areas (by Utthan); organising self-employed traders and producers (SEWA); watershed planning (AKRSP); shifting the victims of caste clashes to urban areas, are efforts worth noting. (4) Women's involvement in voluntary organisations is gradually increasing, and today there are more than 50 organisations involved only with women's activities.

There are three major federations of voluntary organisations at the state level, namely, Gram Vikas Sangh, Janpath and Setu. They discuss common problems as well as national and state level policy issues. Though somewhat radical organisations have emerged in the past decade (Disha and Eklavya Sansathan in tribal areas), most voluntary organisations are non-radical in character.

Several voluntary organisations seem to have been able to influence the policy-making process at the state and national levels. Examples are SEWA's success in the setting up of the national commission on self-employed women by the government of India and in the introduction of some official schemes such as women's banking, legal protection to home based workers, etc, and Utthan's impact on the drinking water scene. Also, several organisations have provided a variety of models in different spheres: ASAG and VIKAS in rural and urban housing, Vivekanand Trust and

AKRSP models in natural resource management, SAFAI Vidyalaya in sanitation and hygiene, SEWA in women's milk co-operatives, Janvikas in training of the trainers, etc. These models are observed to be replicable in character.

In spite of these achievements, voluntary organisations have not had much success in making any significant impact on the poverty scene in Gujarat. These organisations have still not emerged as a strong pressure group or a lobby in spite of their influence here and there. Nor have they expanded their coverage to vast areas of the state to create a kind of voluntary movement. The major factors responsible for this failure are: (1) Most of the organisations operate on a very small-scale in a scattered fashion. (2) After their small-scale success, they receive support from foreign funding agencies in the international circuit. Their successful small model then frequently travels to several countries located in different continents and they lose touch with reality and drift away from their main objectives. (3) The easy outside money frequently influences their work style and life style and they find it difficult to operate with local money. (4) A new hierarchy seems to have been created within these organisations in which those who know English go out to attend national and international conferences, meet the donor agencies, earn high salaries and take decisions; while those who speak Gujarati remain at the grass roots level, have a limited say in decision-making and earn low salaries. This breaks the morale of grass roots workers and also creates a wide gap between the workers and the managers in the organisations. (5) There is no satisfactory system of ensuring the accountability of voluntary organisations. These organisations are not accountable to the poor (the poor are too weak); nor to the foreign funding agencies who do not understand much; nor to the government as they do not use government funds on a large scale. In short, they are virtually accountable to none even though they use huge public resources. (6) Most organisations are centred around personalities, and in spite of their professionalism and attempts towards participative management, most of them tend to remain personalised. (7) Many voluntary organisations are selective with regard to programmes and people, and with large financial and human resources they work in a few villages with only a limited number of programmes carefully selected. As pointed out by a young and enthusiastic collector, these organisations spend years in a few villages undertaking a few programmes with huge resources and highly qualified people. Can they really provide a model of any kind?

To sum up, the voluntary movement in Gujarat still has a long way to go to contribute significantly to poverty alleviation.

V Future Directions

The two major questions which emerge from the above discussion are: (a) how to modify the growth process in Gujarat so that along with higher long term growth a significant reduction in poverty is achieved?; and (b) how to modify the pro-poor approach of the state government so that the efforts become more cost effective. This section discusses these questions.

As far as the growth strategy of the state is concerned, there is a need to extend growth to wider areas and to larger sections of the population. This will ensure an optimum use of the state's resources on the one hand and maximum employment of human resources on the other.

Regional dispersal of growth in Gujarat requires massive investment in the backward regions in two major sectors – environment and socio-economic infrastructure. In regard to environment, we have seen above that the backward regions of Gujarat suffer from basic environmental constraints such as deforestation and declining vegetation cover, sinking water tables, salinisation and general degradation of soil, advancing deserts, etc. In order to protect the environment and regenerate the ecology of these regions, large-scale activities in the field of land and water management need to be undertaken systematically through comprehensive watershed development programmes. Since the efforts made so far have been scattered and isolated, there is an urgent need to undertake these activities more systematically. In regard to socio-economic infrastructure, the basic facilities needed to promote growth in backward regions are village approach roads and paving of internal roads; facilities for minimum sanitation and hygiene; drinking water; housing for the poor; village forests for fodder and fuel, and buildings for schools, health centres, godowns, banks, PDS shops, panchayat offices, halwadis, marketing yards, etc. Large-scale investment in environment and infrastructure will broaden the base of the growth process in the state. These investments will prepare a sound base in backward regions to support self-sustained development in agriculture, in non-farm primary sector activities such as dairy farming, animal husbandry, horticulture, forestry, fishery, poultry farming, sericulture, etc. as well as in the secondary and tertiary sectors. This will generate massive direct and indirect employment opportunities which in turn will reduce poverty drastically.

PRO POOR STRATEGY

The first issue here is the validity of the PAP (poverty alleviation programmes) strategy. Do we need this strategy of direct attack on poverty? There seem to be three major approaches to this question. According to the first, there is no need for such a strategy because poverty should be taken care of by the growth process of the economy. According to this view, the rate and pattern of economic growth should be modified so that the access of the poor to growth opportunities improves and poverty is gradually alleviated. According to the second approach, poverty cannot be alleviated effectively without introducing structural changes in favour of the poor. PAPs in the present socio-economic structure trickle up to the non-poor rather than down to the poor. The PAP strategy should therefore be implemented along with structural measures to improve the bargaining strength of the poor. According to the third approach, the PAP strategy is necessary for poverty alleviation as it improves the access of the poor to development opportunities, uses the un-under-employed for capital formation, and has the potential to strengthen the poor by improving their assets and incomes. Though there is some thing to be said for all the approaches, the issues involved are not very simple. For example, though it is true that ultimately it is growth that will alleviate poverty, the relevant question is whether our economy can grow fast enough. Perhaps it is possible to use surplus labour to promote the growth rate of the economy through poverty alleviation programmes. Also, though one would like to recommend radical structural changes, the political feasibility of introducing them directly is limited. One could, however, use PAPs for bringing about slow but firm changes in the economic structure in favour of the poor. In short, the PAP strategy has the capacity to modify the growth process as well as to strengthen the bargaining power of the poor.

The PAP strategy, however, should be modified into the following ways to undertake the above task: (1) a package of minimum social security measures, a well designed public distribution system, grain banks; consumption loans at reasonable rates for the lean season; seed banks, etc. to plug the points of exploitation of the poor to enable them to stand on their own feet (2) promoting organisation of the poor. Experience has shown that though the government cannot contribute directly to organising the poor, it can support the process of organisation by removing the impediments and by recognising the role of people's organisation in development explicitly and formally; (3) employment and income generating programmes to strengthen the asset base of the poor

directly and indirectly; and (d) decentralisation of planning and implementation of poverty programmes so that they are adapted to local conditions.

CONCLUDING OBSERVATIONS

The basic nature of the development path of Gujarat does not seem to have the ability to achieve either sustainable growth or sustainable and significant reduction in the poverty level. The organic nature of the development path which promotes high-tech industrialisation and which is likely to promote this further after the structural adjustment programme, has certain important limitations. This path will tend to strengthen the selective pattern of development in the state which will favour mainly the relatively developed regions and relatively better off sections of the population. It will neglect the relatively backward areas which are environmentally degraded and weak in infrastructural facilities, as these regions will not yield high returns on (industrial) investment in the short run.

This selective development will put constraints on the growth rate of the state economy because it will (a) leave agriculture weak and fluctuating, (b) widen regional disparities in growth, and (c) tend to shrink the overall size of the market in the state. All this will affect the poor adversely since they will not get enough employment and the degraded environment will affect them negatively.

The experience of the state has shown that it is not enough to formulate a large number of innovative programmes and schemes for the poor. What is needed is a strong political commitment on the part of the state leadership to the poor and to a sustainable and healthy development of the state economy. Unless Gujarat is fortunate enough to get this, poverty in the state will not be eradicated.

New from KONARK

SOUTH ASIAN DRAMA Travails of Misgovernance

by Sundeep Waslekar

South Asian Drama surveys the problems and pitfalls of governance thirty years after Gunnar Myrdal's Asian Drama provoked scholars and policy makers. The book comes out at a time when South Asia stands at the crossroads of economic liberalization and democratic revival on the one hand and political degeneration and violent conflicts on the other. Are South Asian states tigers in the making or rogue elephants about to collapse on an oil slick?

Do ethnic, communal and inter-state wars result from genuine material differences or from the abuse of age-old social denominators by power hungry men? Is there a threat of nuclear annihilation to the region or are there even more dangerous weapons than hydrogen bombs in the basements of South Asia's rulers? The author addresses these and other pertinent questions. Finally, he reveals the ultimate challenge facing a billion people.

The author, a former scholar at Oxford University, UK, and a former research fellow at the Centre for Policy Research, New Delhi, currently heads the International Centre for Peace Initiatives, Bombay. He is consulted by leading think-tanks from different parts of the world on regional security and cooperation issues.

Development, Poverty and Policy

The Haryana Experience

Sheila Bhalla

In the prosperous state of Haryana, the poverty ratio has been declining continuously over the last 25 years to the point where the state now has the second lowest incidence of poverty in the country. In this process, centrally-sponsored programmes for poverty alleviation have been strictly peripheral. The Haryana experience suggests that sustained growth in agriculture plus a deliberate policy of income and occupational diversification is the most effective cure for poverty. While the strategy of investment in rural infrastructure, agriculture and industrial development appears to have worked, Haryana still has a poor record in regard to quality of life indicators such as health, mortality, and sex ratio.

HISTORY tells us that in poor Asian countries, the most effective way to reduce poverty fast is to redistribute productive assets.¹ In predominantly agricultural countries, where self-employment is the rule and dependence on wage labour is largely the product of population pressure on more or less fixed cropped area, this implies that land reform should be the first priority in a poverty alleviation strategy. The proposition that for any given level of per capita income, greater equality is a precondition for lifting poor rural households out of poverty [Myrdal 1970] is a more general one. This sequence involves a major change in the balance of political power, as in China, or nearer to home, as in Kerala, where land redistribution and tenancy legislation rolled back the rise of landlessness and organisations of rural labourers pushed up the wages of farm workers.

The slower and less certain route is to increase land and labour productivity and employment at a rate fast enough to stay ahead of population growth. Thus, even with increases in the absolute numbers mainly directly dependent on the land, the demographic burden on the rural asset base may be counter-balanced by land augmenting investment and improvements in crop production technology. Within rural areas, if the growth in farm incomes is accompanied by workforce diversification sufficiently rapid to drain off some of the surplus agricultural labour and to raise rural wages all round, the landless and near landless may be accommodated at rising incomes outside of agriculture as well as within it. Historically, such structural change in the rural workforce has been associated with expanding secondary and tertiary sector production in market towns and cities. This induces rural-to-urban migration, which helps to relieve the population pressure on land. Historically also, the process of workforce diversification has been associated with a decline in the relative importance of self-employment, and a corresponding rise in the share of wage and salary earners in both the rural and the urban workforces. For those who are already

landless, or on the verge of it, and for those who work in dying traditional rural household industries and services, wage employment works best.

I

Haryana Geography, Polity and Economy

Haryana is a small Indian state with an area of only 44,000 square kms and a 1991 population of less than 16.5 million, 78 per cent of which is rural. Haryana's rural population accounts for roughly 2 per cent of India's rural population. But the state is urbanising rapidly: the decennial growth of urban population from 1981 to 1991 was 43.07 per cent as compared to 21.57 per cent over the decade for rural areas. Much of the recorded urbanisation reflects the growth of small and medium size market towns. There is no major metropolitan centre in Haryana, but Delhi is just next door, and more than half the National Capital Region lies within the borders of the state.

Haryana is characterised by wide regional contrasts in rainfall and terrain, stretching from the relatively high rainfall (110 cms) eroded hill and 'cho' region in Ambala district next to Himachal Pradesh in the north-east, through the fertile plains of Karnal and Kurukshetra districts, to the increasingly drier areas to the south, and ending in the south-west semi-desert strip of Hissar district bordering Rajasthan where annual rainfall is an uncertain 25 cms. Thus Haryana is also a state of marked regional contrasts in land productivity, farm and farm labour incomes, and rural standards of living generally. But the disparities are narrowing, as irrigation is extended south-ward and west-ward into the areas of uncertain rains on the west, and into the inhospitable Aravalli range ridge which runs through Mahendragarh and Gurgaon districts to Delhi. The location of two major industrial concentrations adjacent to the areas less well endowed for agricultural purposes has helped to redress the regional rural income in balance, and the rapid rise of per capita incomes generally has been

associated with the development of a modern tertiary sector in rural areas, covering transport, communications, banking, health and educational services as well as local offices of various branches of government administration. The resulting diversification of rural occupations has substantially reduced the level of direct and indirect dependence on local agricultural and allied activities. With the rise of frequent and efficient low-cost inter-village and village-to-town transport, trade and manufacturing have had a tendency of late to move to the nearest market town. This development is associated in some areas with an explosion in the incidence of daily commuting by village-resident non-farm workers, including people who have established new businesses in the larger villages and market towns.

Politically the state is dominated by the major cultivating castes, and this has been the case since 1956 when a village born jat, Partap Singh Kairon was elected chief minister. Kairon, who had migrated to the US at the age of 18 and lived, worked and studied there for 10 years, was a 'modern' man. Aggressively secular, influenced on the one hand by ideas and people connected with the Ghadar Party and on the other by a degree from Michigan University and the experience of work in the Ford factory and on farms in California, he visualised for rural Punjab a scientific agriculture, operated by owner cultivators living in villages blessed with a wide range of social and economic infrastructure and linked to each other and the towns by a network of 'pucca' market roads. Kairon also presided over the highly successful programme of consolidation of land holdings and the conferring of land rights on tenants of long standing, which was one of the factors which contributed to a decline in tenancy, and to the rise in the relative importance of self-cultivation by owners to more than two-thirds of the area by 1957. The threat of tenancy legislation induced many landowners to resume land for self-cultivation and the process was accelerated later in response to the possibilities opened up by the introduction

of new HYV seed varieties. The result was that 15 years later the share of area under self-cultivation was above 80 per cent.

Following the setting up of Haryana as a separate state in November 1966, the political leaders of this relatively less developed part of erstwhile Punjab pursued an implicit policy of 'catching up' with their more developed neighbour. Targets in the Fourth Plan (1969-74) and in the early budget documents, both for agriculture and for industry, are repeatedly stated in terms of comparisons, with data given for both Haryana and Punjab to highlight the distance to be covered. It is only in the 1970s that Haryana budget speeches begin to talk in terms of 'first, fastest, and best' – the first state to achieve 100 per cent rural electrification, the highest rate of growth of per capita incomes, the best rural bus service – and so on. While in some important respects from the point of view of poverty alleviation, such as rural employment generation, Haryana has now moved ahead of Punjab, in others, such as per capita SDP and farm output growth rates, Haryana still lags behind. Diversification of the economy and growth of non-agricultural activities is the most striking feature of development since 1961, more particularly between 1971 and 1991. Indicators of this change are summarised in Tables 1 and 2.

Growth rates in non-agriculture have been roughly twice those in agriculture during the past 15 years, running between 7 and 8 per cent for the secondary sector and a bit higher for the tertiary sector. Registered manufacturing has been growing at rates above 9 per cent since 1975, and in the most recent decade unregistered manufacturing at rates well above 10 per cent per year compound. The banking and insurance subsector has also expanded at compound rates from 10 to 15 per cent. Obviously these contrasts between sectoral income growth rates imply rapid change in the structure of the Haryana economy. The combined shares of the non-agricultural sectors in the state domestic product have gone up from only 35 per cent in 1970-71 to a position of clear dominance today with a share of roughly 60 per cent, while agriculture's share has fallen from 64 per cent to something in the neighbourhood of only 40 per cent within two decades. These developments have been associated politically with a series of uneasy alliances between the leading cultivating castes and the expanding rural and urban interests now linked to the fortunes of the growing non-agricultural sectors not only in Haryana itself, but also beyond

EMPLOYMENT AND WAGES

The workforce structure (Table 3), however, remains dominated by agriculture, but even that is changing rapidly. In the 20 years ending in 1991 the share of non-

agricultural workers in the total (rural plus urban) male main workforce rose from under 35 per cent to nearly 43 per cent. In rural areas alone, the change was less spectacular; the non-farm sector's share in the rural workforce moved up from 23 to 26 per cent. This 1991 figure for rural areas is however greater than in most other states. Only Kerala, Himachal Pradesh and West Bengal report a higher incidence of rural non-farm workers than Haryana. In the ranking of states by share of non-agricultural employment in total employment, Haryana's position improved from eighth in 1961 to fourth in 1991 in the case of rural workforce and from ninth to seventh in case of rural and urban workforce.

For the landless, however – and most of Haryana's rural labour households are landless – growth rates in employment and wage rates are what counts. Measured in terms of persondays of work available, Haryana has had the highest rates of growth of rural employment in the country: in agriculture, in non-agriculture, and hence in all rural persondays of work. There are in fact only two states in India where the overall rural employment position can be said to be comfortable: one is Haryana, the other is Andhra Pradesh. In both cases very substantial increases in non-agricultural employment have been combined with respectable agricultural employment growth rates. Everywhere else, the growth rate in rural persondays employment stands below the workforce growth rate of the state concerned. This simply means that in most states, more and more rural workers are, on an average, getting fewer and fewer days of work. But in Haryana, in agriculture as well as in non-agriculture, the rate of growth of employment, measured in persondays, has been more than double the rate of growth of the workforce (Table 4). NSS data further shows that the personday rate of growth between 1972-73 and 1983 was 3.56 per cent for rural employment, 2.45 per cent for agricultural employment and 7.21 per cent for non-agricultural employment. Furthermore, the NSS Rural Labour Enquiry data show that even though landless labour households constituted 91 per cent of all rural labour households, the share of labour households earning less than the going wage rate was only 3 per cent of the total. This is the lowest amongst all the states. It may be noted that Haryana has the lowest incidence of rural workers getting less than the going wage rate because of debt or other obligations contracted with their employers.

The level of earnings of labour depends upon days of employment and the wage rate; fewer days of work with higher wages may be regarded as better than more days of work with low wages. In Punjab growth of wages has been combined with fewer days of work. In Haryana, however, rapid rural employment growth has been combined with

exceptionally high real wage rate. Regardless of data source and choice of deflator, the real wage rates for farm labour in Haryana are now the highest among states for which yearwise data are available from two official sources (Table 5). The rate of growth of real wage rates in Haryana, however, about the lowest in the country. For the time being this hardly constitutes cause for concern, however. High rates of growth of persondays of employment combined with high real wage rate levels have undoubtedly made a major contribution to the rapid reduction of rural poverty among the land poor in the state. This combination of high wage rates with rapid employment growth also helps to account for the perception widely shared by policy-makers that unemployment among manual workers does not constitute a major problem and that concern needs to be focused on the unemployed educated youth.

The recent collapse of the agricultural workforce growth rate to a mere 0.5 per cent in Haryana merits special mention. It reflects the shift of erstwhile cultivators and agricultural labourers to non-farm jobs. What is interesting about this is that the shift took place in Haryana despite the relative much more rapid growth in the number of persondays of work available in agriculture. This implies that the typical farm worker gets employment for a larger number of days. In recent years, also, the expanding opportunities for the absorption of rural labour in non-farm jobs at wage rates typical well above the rates for farm labour, appear to be the key factor in explaining the relative high wages now paid to agricultural labour in states like Haryana.²

TABLE 1: SECTORAL RATES OF GROWTH

sector seem to have been instrumental in pushing up the earnings of agricultural labourers. In short, the dynamics of poverty reduction in the 1980s, as it has affected this important poverty-prone class of people, appears to begin with the shift to better paid non-farm activities in a regime of expanding non-farm work opportunities and rising labour productivity within, as well as outside, agriculture.

However, village studies done in Haryana 10 years earlier in the 1970s, all point almost exclusively to forces operating within agriculture in explanation of the decline in poverty, especially among small and marginal farmers and agricultural labourers. The secondary data also suggest that there was an initial boom in on farm employment both in terms of workers and of person-days. The early expansionary phase in agricultural employment was associated with the spread of irrigation, the introduction of HYV seeds, the increase in fertiliser use, and the rise in the relative importance of tube-well irrigation. This period began in the late 1960s and had run its course by the late 1970s, when negative person-day employment elasticities with respect to yield began to appear for several key crops, including wheat. While it lasted it generated euphoria about the progress of agriculture and about its favourable impact on workforce diversification, transmitted through increased on-farm demand for non-farm goods and services,¹ which is plainly evident in the annual Haryana budget speeches of the era. The objective basis for the optimism of these years, and the cause for the perhaps excessive preoccupation with agriculture, can be appreciated in the light of the explosive growth in the use of modern farm inputs which was recorded at that time. Salient features of this transformation are summarised in Table 6. In brief, net sown area irrigated as a per cent of net sown area rose from 30 per cent to 70 per cent; the area under HYV seeds rose from 12 per cent to 96 per cent in the case of wheat, and from 2 per cent to 85 per cent in the case of rice; fertiliser use (in terms of kgs per hectare) grew at compound rates in the neighbourhood of 20 per cent per annum for some years, with similar rates of growth recorded also in electricity consumption by agriculture. Most of this went to energise tube-wells and pumpsets in the first instance, and their number grew in the first five years of the 'green revolution', at the astounding annual compound rate of 45 per cent. The state government budgets throughout these years were overwhelmingly dominated by agriculture related expenditures. Their main contribution to industry came under the head of electricity generation and distribution, but in the case of industry, the highest recorded decadal growth rate in electricity

consumption was 1.2 per cent for the decade ending 1975-76, a figure far below the corresponding one for agriculture of 22 per cent compound for the same decade. Since the mid-1980s, the pattern of growth of electricity consumption has changed. Now the highest rates of growth in consumption are recorded by non-agricultural, non-industrial users - in particular, the categories 'offices and workshops', 'domestic consumers', and 'public water works' - an interesting reflection of the character of economic growth in the 1980s - in particular the rise in the relative importance of the tertiary sector, both in terms of incomes and in terms of employment, in rural areas as well as urban. These developments were associated with the rapid drawing down of the numbers of rural people living in poverty, and the decline to exceedingly low figures of the incidence of dire poverty.

II

Poverty Levels, Poverty Reduction Performance, and Their Determinants

Haryana's head count poverty ratio, which was always one of the lowest in India, also appears to have been declining continuously over time. With an overall head count ratio of 21.90 and a rural one of 23.17 in 1987-88 according to one estimate, Haryana now enjoys the second lowest incidence of poverty in the country. This is a considerable improvement over the 1970-71 ranking of fourth place and a poverty incidence of roughly 40 per cent in both rural and urban areas. Most of the improvement in Haryana's rank can be attributed to the decline in rural poverty. The urban poverty reduction performance of the state is less impressive, as well as less important in terms of the weight of the urban population in the total rural plus urban population.

Head count ratios by themselves, however, do not tell the whole story. Minhas, Jain and Tendulkar's (1991) work highlighted another important facet of the Indian 'poverty reduction' record; growing populations have, in the majority of states, cancelled out the qualitative improvements reflected in generally declining head count ratios. Haryana is one of only six major states (out of 17) where, despite population growth, the absolute number of poor people in rural areas was smaller in 1987-88 than it was nearly two decades earlier. (The other five states where there were fewer poor rural people in 1987-88 than in 1970-71 are Andhra Pradesh, Kerala, Tamil Nadu, Punjab and Gujarat). In all of these states except Tamil Nadu, the major improvement came in the first dozen years of the period. Haryana recorded the most rapid rate of decline of any state from 1970-71 to 1983, a reduction at the rate of 4 per cent per year in the incidence of rural poverty. The subsequent rate of improvement up to 1987-88 was undistinguished at less than 1 per cent per year. The bad harvests of 1987-88 undoubtedly have a great deal to do with Haryana's poorer performance in the later period. In 1987-88 farm output in Haryana was nearly 18 per cent less than in the preceding year, and far below trend. The net result was that although the head count ratio continued to fall during the last four-and-a-half years of the entire period, the absolute number of poor rural people rose at a rate of just under 1 per cent per year. Given the substantial positive impact of growth on the incidence of poverty, it is likely that a normal harvest would have been associated with a further fall in the absolute number of poor people in rural Haryana, rather than a rise.

Decomposition exercises, [Jain and Tendulkar 1990; Tendulkar and Jain 1991], reveal further that in Haryana, changes in rural consumption expenditure distribution

have reinforced the favourable impact on head count ratios of improvements in real per capita total expenditure. Of the 18 states studied by them only four others enjoyed both favourable growth effects and favourable distribution effects - Gujarat, Orissa, Madhya Pradesh, and Punjab. Haryana recorded the largest favourable distribution effect of any state in India. This achievement seems to have been the fortuitous outcome of the growth process itself, rather than the result of measures taken to redistribute assets, incomes, or social consumption goods in favour of the poor.

At least one effort to integrate the possible effects of direct anti-poverty interventions into the analysis has been made, but it does not generate conclusive results. Kakwani and Subbarao's (1992) work suggests that in states where growth has been accompanied by worsening rural consumption distribution, an especially strong case can be made for pushing poverty programmes. This point is well taken. They go on to argue however that such schemes may be responsible for the decline in inequality in consumption in many states during 1977-83. In the Haryana case, at least, the evidence does not support this interpretation. The decline in poverty due to a decline in inequality in Haryana, according to their figures, was even larger in the preceding period, 1973-78, when no such poverty programmes were in place. Moreover, alternative explanations spring to mind. In Haryana, in particular, it seems more likely that the rise in farm incomes and in demand for agricultural and other wage labour, holds the key. In the end, Kakwani and Subbarao themselves agree that no direct link can be established between the introduction of poverty alleviation schemes and the decline in rural consumption inequalities. They write 'it is difficult to identify the factors that may have contributed to the decline in inequality in many states during 1977-83.' [Kakwani and Subbarao 1990]. The rise in real wage rates, and in some states such as Andhra Pradesh and Haryana the increase in on-farm employment, and the shift of rural workers to non-farm jobs which properly got underway during this period, all seem likely candidates for testing. In short, future analysis needs to consider a number of competing explanations for the observed declines in consumption inequalities: the vigorous pursuit of certain poverty alleviation programmes may indeed turn out to be the explanation for changes over time in a few states, but Haryana does not appear to be one of them.

Disaggregated studies, based on NSS data arranged by household main income source, indicate that, at least in some years, in Haryana, agricultural households are better off than households engaged in rural

manufacturing, transport or services. The relatively low incidence of poverty among rural construction worker households also shows that in Haryana, the construction industry has not been acting as a sump for surplus labour, as it has in most other states. The same studies also demonstrate that past investments in both rural and urban infrastructure account for most of the stark interstate contrasts in poverty recorded for the eight household categories covered [National Commission on Rural Labour 1991]. The quality of agricultural and other rural infrastructure is crucial; investment in the upgradation of rural infrastructure, it appears, is the single most effective rural anti-poverty programme. The evidence also suggests that agricultural infrastructure should be made priority number one.

This is precisely what happened in Haryana. Indeed the initial, almost total pre-occupation of development policy with irrigation, electricity and market roads seems to be the basis for the success of the Haryana policy. But it should also be stated clearly that this strategy was not conceived as a set of measures to relieve poverty. It was seen rather as the road to prosperity for the majority, and with regard to backward regions, explicitly as a means to overcome regional disparities by extending to hitherto lagging areas the irrigation facilities already available to the more advanced ones. Its anti-poverty effects emerged as a by-product of the main thrust which was never directed particularly in favour of 'the bottom 20 per cent'.

Field survey based studies reveal how this strategy worked to reduce the incidence of poverty among different categories of households, mainly dependent on agriculture. An additional advantage of the series of village level studies done in Haryana between 1969 and 1975-76 is that they make it possible to link together the adoption of new technology, household investment and savings, incomes, consumption patterns, and poverty reduction directly.

IMPACT OF GREEN REVOLUTION

The first comprehensive overview of the impact of the 'green revolution' published in 1974 [G. S. Bhalla 1974], covered land productivity, incomes, consumption, savings, and investment. The reference period for the field survey conducted in early 1971 was the crop year 1969-70. Data was collected from 723 cultivating and 142 agricultural labour households in 100 villages in Haryana. This was followed by a second large-scale field survey carried out in 153 sample villages from October 1972 to October 1973, covering 382 agricultural labour and 1,004 cultivating households [S. Bhalla 1976, 1977, 1981,

1989]. Both the next two studies [Sidhu 1991, Sharma 1992] relied on the same primary data from a survey conducted in 1975-76. The data came from 3,412 cultivating, 484 wage labour and 485 other non-cultivating households in 329 Haryana villages.

What these studies show, in brief, is that poverty in rural Haryana has been predominantly a problem of wage labour households and among them particularly of agricultural labourers. Cultivating and other non-cultivating households have both had lower head count ratios and a smaller absolute number of people involved in poverty. The adoption by cultivating households of the new technology appears to have cut the incidence of poverty among them to less than half the figure for the 'non-adopters', by the mid-1970s.

TABLE 5. GROWTH OF WAGE RATES

6. AWI Agricultural Wages in India.

By 1983, although head count ratios had dropped dramatically in Haryana, the poverty profile across similar broad household categories still had not changed. Agricultural and other rural wage labourers were roughly four times more likely to be poverty stricken as members of households self-employed in agriculture. The most remarkable feature, however, is the collapse, apparently only after the mid-1970, of poverty among the agricultural labourers, from something in the neighbourhood of 60 per cent to a figure below 15 per cent. And it is far from self-evident, from the figures reproduced in Table 7, that this rapid amelioration had anything to do directly with the green revolution and its impact on the earnings of this section of the rural workforce.

The field surveys' evidence for cultivators, on the other hand is direct and unambiguous. About the beneficial impact of the green revolution on the condition of labourers the picture is considerably complicated by the emergence during the 'expansionary phase' in on-farm employment of a new kind of differentiation – that between 'permanent' and casual labourers, concurrently with the rise of dairying among them and the expansion of rural non-farm job opportunities. In short, a great many things happened at once which may be thought to have affected the condition of wage labour households. All these studies, however, tried to untangle the skeins and to identify the sources of the perceived improvements in the levels of living of proletarian households.

The impact of the new technology on the earnings of cultivators and on the employment of hired labour seems to have been immediate, and positive for all classes of cultivators even those with what at that time were deemed submarginal holdings. Productivity per acre nearly doubled for each category of cultivators [Bhalla 1974 42] shifting the 5 to 10 acre class from 'deficit' to 'viable' status but leaving the average 0 to 5 acre cultivator running a loss on a farm business income basis counting paid out costs only. Households adopting the new technology spent far more on hired labour than the non-adopters, with the bigger farm operators hiring in relatively more. 'For each additional acre of operational area, the progressive cultivators spent Rs 81.90 on hired labour compared with only Rs 29.80 spent by the non-progressive cultivators' [Bhalla 1974 44]. A substudy on the income structure of agricultural labour households produced the first evidence of a rise in the importance of permanent labourers in the hired farm workforce in the green revolution regions. This was attributed [Bhalla 1974 94] to the availability of 'more continuous work' in the technologically advanced areas. In the process, what happened to the landless households which remained dependent on casual labour was not noted.

Evidence on this came to hand only in the subsequent 1972-73 study.

The key findings of the 1969-70 study, however related to the impact of the adoption of new technology on the incomes, income distribution, savings and investment behaviour of cultivating households. It was found that "since the green revolution has substantially increased the income levels of each category of cultivator", 'the income disparity between the lowest non-progressive and the highest progressive cultivators have tended to increase' [Bhalla 1974 47,51]. However, it was also noted that among the growing set of households which had adopted the new technology, income disparities were less than among the group which continued with traditional input practices. Thus it was concluded that the green revolution had not only increased incomes, it had also "tended to reduce rather than aggravate income disparities among the adopters" [Bhalla 1974 49].

One of the most striking features of the results was the remarkable change in the savings behaviour of the beneficiaries of the green revolution. For non-adopters, of all acreage classes combined, the average propensity to consume was found to be 0.99. The corresponding figure for the 'progressives' was only 0.70, indicating a major difference in the capacity and the motivation to save. Contrasts in their consumption levels were much smaller.

One other important, and at that time unexpected finding was that agricultural labour households were better off than the 0 to 5 acre non-progressive' cultivators. This finding was confirmed by the analysis of all subsequent field work-based studies done in Haryana during the 1970s. The figures from the 1969-70 field survey are reproduced in Table 8. This outcome, it appears, was in part a reflection of the increased demand for hired labour in the green revolution belt.

The index numbers of real wages there showed the biggest increases between 1960 and 1970 by 19 to 26 per cent, while real wages in the backward southern region remained virtually unchanged. Bhalla (1974) commented that the 0 to 5 acre cultivators appear to be involved in farm operations despite the fact that in most parts of Haryana, they could have done better financially, had

they earned their livelihood by offering their labour to other cultivators at prevailing wage rates" (1974 29). Many of them were already doing so to some degree as "a substantial proportion of income of households in this category is being derived from work as agricultural labourers" (1974 99).

One final feature of the 1969-70 findings on agricultural labour households needs to be noted, because it not only persisted but became increasingly important as time went on. This is the part played, in agriculturally backward regions where demand for labour had not at that time yet risen, by dairying, and income from non-farm sources, in jacking up the incomes of wage labour households. The 1969-70 evidence is presented in Table 9.

CHANGES IN EMPLOYMENT LEVELS AND STRUCTURE

As the green revolution matured the train of events which left some agricultural labour households below the poverty line despite rising wages and employment, began to take on an identifiable shape. By 1972-73 the surge of small farm households into the hired labour force reported in S Bhalla (1976) had become a source of grievance for the landless who complained that landed households were taking away their jobs in particular the secure permanent labour jobs. While 0 to 2.5 acre operators accepted casual as well as permanent labour jobs, members of bigger farm households in the prime green revolution regions took up permanent labour jobs almost exclusively. Given the fact that in the prime green revolution regions, more than half of all hired labour days demanded were permanent labour days, the changes on the demand and on the sources of labour supply side combined, tended to eat into the share of the employment cake, which would otherwise have gone to agricultural labour households. For landless households with no working permanent labour member the number of casual labour days work available in some technologically advanced regions actually went down [Bhalla 1981].

Meanwhile a large subset of agricultural labour households went into dairying, either for the first time or on an expanded scale, so also did small farmers. Among the small

TABLE 6 SALIENT FEATURES OF AGRICULTURE TRANSFORMATION

	1965-66	1975-76	1988-89

	(1966-67)		(1989-90)

farmer set, the 'viability line' moved down further in the green revolution areas to just under 2.5 acres instead of the 5 acres reported in the study based on the 1969-70 field survey. This was associated with the introduction of HYV crops in two seasons, instead of just one, and a sharp differentiation in the labour supply behaviour of the 0 to 2.5 acre operators as compared to everyone else. In the technologically advanced regions, these very small acreage operators put back their supply of family labour to their own farm operations to less than one-third the number of family labour days put in by the next, higher, acreage class, and began to hire out the majority of all labour days supplied. In the two non-green revolution regions, the bulk of the labour supplied by the under 2.5 acre operators continued to be in the form of unpaid family labour on their own holdings. Thus, a direct consequence of the green revolution seems to be that by 1972-73, the 0 to 2.5 acre operators were hiring out most of the field crop labour days supplied by them. An indirect consequence was that they reallocated a substantial part of their time in favour of animal husbandry and against own-farm unpaid field crop labour. (The investment data for these households revealed the recent establishment or major expansion of animal husbandry enterprises by many of these small farmers.) Together, the influx of small farm household members into the hired agricultural labour force and into animal husbandry sideline activities, accounted for much of the low per acre input of unpaid family labour into field crop work on their own farms. It also produced the result that the inverse relationship between farm size and per acre labour input vanished except in the southernmost arid region. It was replaced, in four out of five regions, by a positive relationship.

Despite their reallocation of time in favour of the hired labour force, however, the small farmers failed to get as much employment as the landless workers did in the technologically advanced regions. The typical landless agricultural labour household in four out of five regions supplied more than 100 field crop labour days per year, and at least 125 days in each crop season. This annual figure is more than twice the number of days worked by households operating under five acres in the same four regions – 26 days annually – even when the unpaid family days and the hired out days of landed households are both counted. Table 10 gives details.

THE STUDY CAME TO THE FOLLOWING CONCLUSIONS

In general, it appears that occupational diversification builds in a more effective 'floor' to earnings than the high average

agricultural labour income in the greenest of the green revolution areas in Haryana (Region II). The same phenomenon operates effectively, but to a lesser degree, in Region III. The lesson is that a high level of irrigation and widespread adoption of the new farm technology is not enough. The 'trickle down' process does not reach the income strata at the bottom in regions with high incomes but little occupational diversification.

Aside from the heavy concentration of workers in cultivation and agricultural labour in the most prosperous region, two characteristics of the changed pattern of field crop labour supply and demand may have pushed some households to the wall. One was the entry, on a large scale, of members of landed households into the hired agricultural labour force. Had they stuck to cultivation (as they seem to have done in Punjab), or moved out into non-agricultural jobs, the landless would of course have been the sole beneficiaries of the dramatic increase in demand for hired agricultural labour in the early 1970s. But this is beside the point. The fact is that the members of landed households competed with the landless for paid farm labour jobs, precisely because these jobs were more attractive than the alternatives available at that time. The cause, and the cure, for this seems to have been located outside the agricultural sector.

The second factor was the new structure of demand for hired labour itself. In the two most advanced regions, the predominance of hired permanent labour so depressed the

number of casual labour days work available that landless households got fewer days of casual work than their counterparts in less developed areas. The households which suffered on this account belonged to the minority subset whose members engaged exclusively in casual labour. While most landless households earned more than they ever had, the ones who failed to get in on the permanent labour 'bonanza' get stuck with the worst of several possible worlds.

Thus the fact that the rate of rural occupational diversification in Haryana generally really took off only after the mid-1970s, may account, partly, for the persistence of high poverty levels among agricultural labourers well into the 1970s. Within agriculture, the peaking of demand for permanent labour in roughly 1977-78¹ appears to be the other identifiable contributory factor.

How much of the occupational diversification which took place in rural areas is due to the rise in on-farm incomes is also debatable. Recent studies [Papola 1987; Kundu 1991] find that in Haryana the rural industries which grew most neither use inputs from nor provide inputs to agriculture. Many are ancillaries for the bigger town-based industries of the south-eastern region of Haryana. This position is confirmed more generally by an analysis of cross-section statewide data repeated for each of the census years: 1961, 1971 and 1981. The link between agricultural productivity and the degree of rural workforce diversification was strong and highly significant at the

TABLE 7: HARYANA RURAL HEAD COUNT RATIOS FOR BROAD HOUSEHOLD
MAIN INCOME SOURCE CATEGORIES

Household Main Income Source (1)	Head Count Ratios (Per Cent) for Specified Years and Poverty Lines

Always a step ahead. And always behind you

start of the 1960s; it weakened by 1971, and had disappeared by 1981 [Bhalla 1992].

The Sidhu (1991) and Sharma (1992) studies were both based on data gathered in 1975-76, that is, at about the time of the turning point for many of the variables thought to have been important in explaining the household and regional poverty patterns among landless households in Haryana in the early 1970s. This was also just before the larger cultivators changed their strategy for dealing with the problem of rising labour costs. Labour (and bullock) displacing mechanisation replaced the permanent labour contract as the chosen means. The evidence on the substitution of capital for labour, and of casual labour in place of workers on long-term contract, began to accumulate from about 1977-78 onwards.

The Sidhu (1991) study, based on 1975-76 data, addressed three main questions. Do agricultural labourers in successful new technology areas have more days of work? Do they get higher wages in such areas? And, if yes, does it get reflected in their consumption patterns and levels of living? His study confirmed, first, that the new technology had tended to raise the share of attached, or 'permanent' labourers in the total, and that there was "a definite negative relationship between the proportion of attached labour and the level of unemployment" [Sidhu 1991:260]. From this it was inferred that it was primarily demand conditions which had led to the predominance of long-term labour contracts, and that employers adopted the permanent labour solution both to ensure some labour supply in peak seasons, and to avoid the high costs of casual labour during these peaks. The practice was found to have "reduced the work availability for casual workers in terms of number of days", although it had not significantly affected the overall employment prospects of all the wage labourers (1991:261).

While it was found that mechanisation was tending to aggravate the unemployment problems of wage labourers, "the combined effect of controlled irrigation, high yielding seed varieties, and fertilisers on farm employment", as of 1975-76, still "dominated over that of mechanisation" [Sidhu 1991:27]. An average wage labourer got work for 289 days per year in Punjab and for 303 days in Haryana, and an average casual worker for 241 days in Punjab compared to 258 in Haryana. Thus the relatively better agricultural employment position in Haryana, discussed in later documents,⁶ had already emerged by 1975-76. The typical wage labour household in Haryana also possessed more animal wealth. However, wage rates for attached as well as casual labour were at that time higher in Punjab than in Haryana. Regression

analysis showed that alternative employment opportunities outside agriculture helped to reduce the incidence of unemployment among rural wage labourers. Last but not least, a negative and statistically significant relationship was found between the incidence of poverty among wage labour households and among other non-cultivating households, and the level of agricultural development of districts as measured by productivity per acre or per male agricultural worker. Sidhu found that "accelerated agricultural growth, even within the existing institutional set up does help, to some extent, in alleviating the problem of absolute poverty prevailing among wage labour and other non-cultivating households (1991:266). He concludes: "our results show that agricultural growth, availability of employment opportunities outside agriculture and higher wage rates tend to reduce poverty significantly" (1991:267). The "trickle down hypothesis... is more or less confirmed" (1991:266). In short, the Sidhu study verifies and extends the results obtained from field work conducted three years earlier.

The Sharma (1992) study, which focused on cultivators, generated results not much different from the Bhalla (1974) work based on a field survey conducted six years before, in 1969-70. There seem to have been few qualitative changes in the intervening period. The most important ones were, first, that while the proportion of large farmers adopting the new technology was higher, the "intensity of adoption" decreases with farm size. The result, by 1975-76, was that "the per acre output and income gains were higher for the small size groups" [Sharma 1992:123]. Second, it was established that among cultivators "the adoption of new technology ...has made a substantial dent on absolute poverty and on the intensity of poverty" (1992:142) measured in terms of head count ratios and the Sen P measure, respectively.

The picture which emerges from the village surveys thus supports the view that the operation of a trickle down mechanism was the key element in the Haryana poverty reduction process. The impact on cultivating households was direct, immediate, and sustained. But for labour households, the evidence indicates that diverse factors were operating simultaneously. Most of them were favourable - wages and employment, for example. But the spread of the institution of long-term 'permanent labour' contracts in the first half of the 1970s, and the rise of mechanisation a little later, both operated to deprive some segments of the hired farm workforce of jobs. The net result, however, was an improvement in the economic welfare of the wage earning class, but this outcome was at least in part traceable to the expansion of non-farm job opportunities - a factor not directly attributable to the 'agriculture first'

strategy of the Haryana government, even in the early years of the 1970s.

QUALITY OF LIFE INDICATORS

Assessments of Haryana's creditable poverty reduction performance, based on economic indicators such as head count ratios, wage levels or employment, need to be balanced, however, by an examination of non-economic rural 'quality of life indicators'. This is necessary because there is a gross asymmetry in the Haryana rankings between these two kinds of measures. The Haryana record on provision of social consumption goods has been poor, and on some related mortality and other demographic indicators of welfare, the Haryana performance has been among the worst in the country. This asymmetry reveals the limitations of excessive reliance on the dynamics of 'trickle down' processes, however successful these may be in their own, economic, sphere.

Thus, among 16 states Haryana ranks sixth in terms of male child mortality, and 12 in terms of female child mortality rates. Moreover, no other state registers such a wide gap between male and female child death rates. The difference contributes to the appalling rural sex ratio: 876.66 females per thousand males in 1991. This is the worst sex ratio of any state in the country. The 1972-73 field survey, discussed earlier, found that the really bad sex ratios were an attribute of landed households; the sex ratios for agricultural labour households were far better. For men and women together, life expectancy comes to just under 55 years, a figure which places Haryana fifth in a ranking of 14

TABLE 8: PER CAPITA INCOME AND CONSUMPTION OF AGRICULTURAL LABOUR AND SMALL FARM HOUSEHOLDS

Indicator	0 to 5 Acre Farm Operators		
	Agricultural Labour Households	Non-Progressive	Progressive
Per capita income	382.41	316.70	437.55
Per capita consumption	454.41	447.50	525.40

TABLE 9: INCOME STRUCTURE, BY SOURCE, OF AGRICULTURAL LABOUR HOUSEHOLDS, 1969-70 (per cent)

Income Source	Northern Region	Central Region	Southern Region
From Agricultural labour permanent	65.9	60.0	13.4
From Agricultural labour casual	26.1	29.5	61.5
Dairying	5.8	2.7	13.3
Other sources	2.2	7.8	11.7

states Kerala stands first, followed by Punjab, Karnataka and Maharashtra, in that order.

Some of the reasons for the disproportionately high female child death rates, and the poor survival rates of women despite the relatively low incidence of poverty, emerge from the NSS 42nd round data on social consumption. Rural Haryana records the lowest incidence of hospital births in India less than 2.5 per cent of all rural births take place in hospital. Probing questions to find the reasons why so many births were taking place outside hospital elicited the response, in two-thirds of the cases, that domiciliary birth was 'preferred'. Although this response was a fairly common one in rural India in only four other states did more than half the 'non-hospital birth' respondents offer this as the reason. These states were Madhya Pradesh (57.41 per cent), Punjab (53.96 per cent), Gujarat (51.32 per cent), and Rajasthan (51.00 per cent). Two of these states - Punjab and Gujarat - are also among the richest in the country.

On the paediatric care and immunisation fronts also, rural Haryana's performance is unimpressive. Much poorer states, such as Tamil Nadu, Karnataka and Kerala, all appear to provide distinctly superior rural child care and immunisation services. Tamil Nadu, in addition, can boast of an outstanding pre-school age supplementary food programme.

In short, 'public' priorities on the rural health front evidently do not include the provision of the kind of social consumption goods covered by the NSS 42nd round (1986-87) survey. The health needs of women and children, in particular, appear to come lower down on the priority list than in almost any other state.

The literacy picture, however, appears to be getting better even faster in Haryana than it is in India as a whole. Haryana now ranks fifth among 14 states in male literacy and ninth with respect to female literacy. In 1971, the figures were ninth and 10th, for males and females respectively. For males in the 10 to 14 age group the picture is even better. Haryana has now moved up to second position. The comparable figure for females in this age group has gone up to fifth place, as compared to 10th place for the corresponding population of 1971. Rural education in Haryana thus seems to be involved in a catching up process. Recent field work¹ indicates that the movement of rural children into high school and college education has gained momentum. Excellent rural and rural-urban transport both public and private has been playing an enabling role by improving access to higher education. This in turn is now leading to a major change in the level and character of work participation by young rural women.

In some states the public distribution systems have become important institutions

for ensuring the access of the rural poor to minimum foodgrain requirements. But in Haryana, kerosene and sugar are the only commodities purchased in significant quantities from rural PDS outlets. The staple foodgrain wheat, is generally not supplied through the rural public distribution system, the NSS 42nd round did not record even a single case of any rural PDS purchase of wheat. Moreover, very few respondents reported purchasing wheat at all, from any source - a mere 18 per cent of rural persons. This suggests the overwhelming importance of self-provisioning, either out of home produced wheat or out of in-kind wages. But these NSS results do not quite tally with the findings of independent field surveys. While Bhalla (1974) confirms that the bulk of cultivators' consumption is home produced, Sidhu (1991) finds that more than 80 per cent of the cereal requirements of wage labour and other non-cultivating households were met through market purchase.² Since wage workers' and other non-farm households constitute about half the rural household population, the NSS estimate of 18 per cent purchasing wheat at all from any source, seems too low. But the fact that all or nearly all of those who buy wheat get it from non-PDS sources is correct. Although wage labour households would undoubtedly gain from 'green card' status along the lines of the Andhra experiment, there does not seem to have been much political pressure to extend the commodity coverage of the skeletal rural fair price shop system in Haryana. Indeed, one version of Haryana's Eighth Plan suggests that the pressure is coming from Delhi! Thus the rural public distribution 'system' may remain what it was - a minor appendage of a co-operative movement whose role is visualised almost exclusively either in terms of inputs for agricultural production, or in terms of agro-processing including sugar mills, distilleries, gineries, spinning mills and dairy development units. In short, Haryana's public distribution system was never designed as an instrument for ameliorating the rigours of rural poverty hence it can hardly be

expected to function like one. More will be said about the place of PDS outlets in the Haryana scheme of things in the next section.

On most other elements in the usual basic needs array, Haryana scores near the top. Haryana is the only state where all drinking water sources are reported to be perennial and nearly 98 per cent of all drinking water comes from taps, tube-wells, handpumps or pucca wells. Tube-wells and handpumps are the dominant source, taps are the second most important source. In 1986-87 more than 60 per cent of dwellings were electrified, and less than 30 per cent were 'katcha'. As in Punjab, the vast majority of dwellings are regularly disinfected. However, on the in-house sanitation front, rural Haryana ranks at the bottom, with scarcely 1 1/2 per cent of all households reporting a latrine in or around the house. In this case there seems to be considerable political interest. Budget and plan documents talk in enthusiastic terms of upgrading the sanitation and sewerage facilities in villages and large towns. If plans presently afoot are carried through, there will be a considerable change during the present decade. The matter is discussed further in the next section.

To sum up, the growth process in Haryana seems to have had several desirable properties: it reduced both the head count ratios and the absolute number of poor rural people, it improved income distribution, and towards the end of the 1970s, it enabled a substantial number of people to step into non-agricultural jobs in rural areas themselves, or in nearby towns. High levels of public investments followed by private investment, in agriculture in the first instance seems to have been the key to this success story. In short, the picture which emerges from the Haryana village surveys of the late 1960s and the early to mid-1970s supports the view that the trickle down mechanism, which originated in agriculture, is what worked in the Haryana poverty reduction process. For wage labour households, in addition, the expansion of non-farm employment played an increasingly important role, as the green revolution

TABLE 10 PER HOUSEHOLD SUPPLY OF UNPAID AND HIRED OUT FIELD CROP LABOUR (STANDARDISED MANDAYS)

Household Group	Region I (Wet Hilly Poor)	Region II (Prime Green Revolution Area)	Region III (Second Most Region)	Region IV (Arid, Backward Advanced)	Region V (Mediocre HYV Crop in One Season Only)
Landless labour households	463.6	404.1	320.4	302.1	173.7
0 to 2.5 acre operators	49.6	141.7	141.2	51.4	53.5
2.5 to 5 acre operators	132.3	174.4	178.1	101.9	109.4
All acreage class operators (other than landless)	168.2	288.5	234.5	131.7	166.7

Source: S. Bhalla (1981) based on 1972-73 field survey

'matured'. In the improved conditions of low income households, the public distribution system could have played, at best, a marginal role, for the excellent reason that it does not supply the staple foodgrain, wheat, at all.

Finally, Haryana's discreditable health, mortality, sex ratio, and sanitation figures reveal that 'trickle down' processes cannot at all be relied upon to generate benefits outside the strictly economic sphere. There are, it would seem, no automatic spread effects into either the social or the political spheres. The rural groups which dominated in the 1960s continue to dominate today, and there are no noteworthy concessions, in the form of policies and programmes to uplift those who eke out their existence at the bottom end of the economic scale. Nor are there any new schemes which might be thought to reflect an improvement in the political clout of the rural landless, or near landless workers, or of women as a generally disadvantaged rural group. The series of special provisions for members of scheduled castes, however, may be interpreted as an exception to this otherwise general proposition. It is even possible that the prominence given to some of these measures in recent years indicates that scheduled caste voters are an acknowledged constituency, worth cultivating by means of measures directed explicitly to their individual and group welfare. These and other measures are discussed in Section III.

III

Haryana Strategy in Perspective

This section begins with broad questions of development strategy in Haryana's own historical perspective. Interviews with state and central government officials associated with the making of Haryana policies and programmes provide a view from New Delhi as well as the Chandigarh assessment. The factual framework for these interpretations has been culled from a series of documents, in particular budget speeches, five-year plans and programme appraisals, and reports of official working groups and committees. The aim is to find out how the distinctive features of Haryana's development priorities and official perceptions emerged, and what shaped the current dismissive attitudes to conventional poverty alleviation packages. This section ends with an account of the programmes in operation, the sometimes conflicting comments of state and central government officials on them, and their suggestions for alternative approaches to some of the centrally-sponsored poverty alleviation programmes.

It is generally agreed that the governments which gained power in Haryana from 1966 were dominated by rural interests, in particular the 'bullock capitalists' allied with

the larger landowners. Moreover, it is argued that it was, at least in part, an accident of history that their vigorous pursuit of their own interests served others as well as themselves so well. Haryana's version of an agriculture-led growth strategy was well launched by the time concern began to be expressed by 'outsiders' about what might happen in the process to the landless and the land poor. Insiders tended to assume that when agriculture grew, everybody benefited. There seems to have been no real second thoughts on this score.

Even in subsequent decades, the notion that specially targeted poverty alleviation programmes might be needed never gained much ground, for several reasons. One was because events gave such ample support to the contention that 'trickle down' processes could be relied upon to do the job. As Haryana's green revolution took off, the improvements in the economic welfare of all sections of rural society were sufficiently rapid, and large enough, to be obvious to those overseeing events. Moreover, the fact, later recorded by Kakwani and Subbarao (1992) that rural consumption inequalities got reduced; the fact that work opportunities opened up for the landless [Sidhu 1991]; and that small farmers gained more per acre than larger ones, in income as well as output terms [Sharma 1992], all combined to take the edge off any rural based potential political opposition to an unadulterated 'agriculture first' growth strategy.

The role and emergence of the industrial sector of Haryana must also be noted. A remarkable feature in this context is the absence of an effective state level political presence of industrial interests. One reason, it seems, was that industries, concentrated mainly in Ambala district near Chandigarh and Faridabad near Delhi, were established by 'outsiders'. Faridabad was developed for resettlement of refugees from Pakistan, who lived in Delhi but worked in Faridabad. During the 1970s and the 1980s, large-scale industrial units were set up by well known Indian firms such as Eicher, Escorts, Goodyear, Kelvinator, and Larsen and Toubro. Even though Faridabad industries contribute more than half of the state government's budgetary revenues, interest in them is focused primarily on the concern for finding jobs for educated rural youth. The notion of dispersed and balanced industrial development with local rural linkages has given way to the notion of concentrating industrial activities at a few selected points with a cluster of ancillaries around larger units.

The strategy of 'industrial concentration', however, did not lead to enclave development. The impact of industrial agglomerations of large and small scale units in rural areas and market towns was tremendous. In the rural small and tiny sector,

local entrepreneurship thrived, much of it by way of tie-ups with 'mother industries' in the urban industrial townships. Today there are estimated to be about 6,000 such ancillaries feeding the Faridabad complex alone. These units now exist in rural areas side by side with trading and traditional, craft like ventures, some of which, like khadi or embroidered shoes, have also found for themselves an urban market. Given the high standards of rural transport, power, banking and related infrastructure in several districts, medium- and even large-scale industrial units have also been established in rural areas, independent of any connection with the units in the major industrial complexes. Together with the rise in rural construction, transport, and tertiary sector infrastructure and other activities, these industries provide the jobs which have enabled many rural wage dependent households to rise out of poverty.

In more recent years, nonetheless, there has been a resurgence of political interest in accelerated industrial and tertiary sector development. This interest has been revived by the realisation in the early 1980, that agriculture was not to be relied upon to absorb labour indefinitely. Industry, especially rural small-scale industry, is now seen as a better alternative than government-sponsored wage paid employment schemes. To this end the emphasis has shifted further in favour of the improvement of rural infrastructure, including amenities such as tapped drinking water and sanitation. By the mid-1980s rural occupational diversification was stated as an explicit goal, although the official initiation of this strategy seems to have followed reality rather than leading it. Rural infrastructure upgradation and specialised technical and vocational training are now described as the key to the success of the employment-oriented industrial dispersion policy.

The shift in emphasis, it is more likely, is mainly the product of a substantial change in the aspirations of village and small town residents, including, it should be noted, the members of rural wage labour households, many of whom are now commuting daily to non-farm jobs, in their own or other peoples' industrial and tertiary sector units in nearby villages and market towns.

Direct poverty alleviation programmes are treated, at best, as peripheral by officials. They do not merit much mention in political statements either. Certain officers undoubtedly would like to see particular welfare schemes pushed through vigorously, but the prevailing cynicism about the implementation of the 'programmatic approach' to poverty alleviation is unmistakable. A sample of responses to questions conveys the negative assessment.

The question: "what do you think of as the major cause of reduction in poverty in

Haryana?" elicited straightforward answers: "Infrastructure; nearness to Delhi markets and services". Within infrastructure, "roads and electricity"; in agriculture, "irrigation is decisive". To the question: "what is your most successful anti-poverty programme?", the replies came: "there is nothing as such"; "there was no programme as such; the outcome is the result of trickle down". To probing questions: "There is no scheme for pulling up the people at the bottom". On a programme which has attracted considerable attention: "The pension scheme is a racket".

Officials also tended to pour cold water on the idea that there is now, or ever was, a deliberate strategy or set of programmes aimed at diversification of the workforce, or the industrial structure, of Haryana generally, or of rural Haryana in particular: "The achieved diversification record is a by-product."

On education, health services, literacy, programmes to reduce infant mortality and so on it was asked: "Are these perceived as programmes which enable the poor to increase their capabilities?" One person said: "No, it enables the landholders, property owners". From another: "The emphasis on education is significant, but not as poverty, alleviation – it is to enable people to get into services". Similarly, regarding co-operatives: "They are not for poor people – they are for extension of credit, provision of inputs for landed people".

Related comments from the central government end, tell another part of the story. "Haryana government officials don't want the kind of programme we have, but hey don't want to give up the money either". They ask: "Can't we divert it to the educated unemployed, or village infrastructural development?" "Punjab is saying the same things". "They can't get labour at Rs 18 – need to give double the wage". "They say: Tamil Nadu is giving money to each village for infrastructural development. Why can't we give centrally-sponsored scheme money for this?" "The country is too diverse for across the board common programmes to suit each and every one."

When told that some central government officers had suggested that Haryana would prefer to direct JRY (or similar) funds to i) rural infrastructure, and (ii) schemes for the educated unemployed, the view from Haryana in the first instance was "It is a question of balance – the material and wage components ... this is the crux of the matter". It was stated also that Haryana had "no concrete scheme" for the educated unemployed.

Conversations with officials together with documentary sources also reveal that pressure is exerted sometimes by the centre, on state government officials to alter rural development priorities and social welfare programme proposals in ways which would

bring them more in line with the content and objectives of conventional poverty removal programmes. Illustrations are given in the discussion of selected programmes below.

POVERTY ALLEVIATION PROGRAMMES

What kinds of programme does Haryana in fact promote, and which ones are carried out mainly because funds for them are available? In the second category come the entire set of asset creation and rural employment schemes: IRDP, TRYSEM, DWCRA, JRY and its subschemes such as the Million Wells Scheme, and DPAP. All of these are carried out, after a fashion, but the state government would like to see the coverage, prescribed norms, or emphasis of all of them revised in one way or another. The schemes which Haryana is prepared to initiate on its own, or push despite varying degrees of central government reluctance, relate to village infrastructure and amenities and non-targeted welfare schemes such as the initially almost universal old age pension scheme. There also seems to be considerable political backing for a diverse package of scheduled caste welfare programmes.

A review of IRDP performance in the state appears, at first glance to be quite respectable insofar as the share of the state in the total IRDP expenditure in the country corresponds to its share in the total number of poor persons – both are about 1 to 1.5 per cent. Haryana's own assessment of IRDP and TRYSEM, a related poverty alleviation programme, is rather derogatory. TRYSEM is described as 'a waste of money' and IRDP is held in low esteem by officials. The concurrent evaluations of IRDP done by the department of rural development also show that Haryana's performance was worse than all India in that none of the beneficiaries were able to cross the poverty line, and only 46 per cent of investment was found intact compared to the all India average of 73 per cent. The special programme for women and children, viz, DWCRA, is also not considered a good scheme. It has been difficult to identify suitable income generating activities for women. Marketing of production is also found to be a problem. Most important, however, is the fact that for many women wage labour at relatively high wages is considered by them as a better alternative than low earning self-employment activities.

The employment generating schemes – NREP, RLEGP and JRY – have been considered better even though the norm of 60:40 for wage and non-wage component of expenditure is considered faulty, as assets of lasting value cannot be created with such a low material component. The structure and nature of the unemployment problem in Haryana also calls for a more flexible

approach to employment generation in order that the special problems of educated rural youth or the problems of specific areas, e.g. waste land development or forestry, can be given more importance than short-term job creation.

In short, infrastructural development is identified by Haryana officials as the key to the success of any rural anti-poverty programme, whether it is visualised as such or not. Employability also depends on upgrading the skills of job-seekers. The need for supplementary unskilled labour programmes is recognised to exist only in pockets – and these, in turn, are identified with unirrigated or erosion-prone regions which are seen as the appropriate areas for DPAP type manual labour-intensive employment activities.

The state's own priorities are well illustrated by the contents and coverage of the community development programme. This category covers 11 schemes. Of these four are for women, one is for harijans and one for backward classes. Proposed outlays reveal that the 'Low Cost Rural Sanitation Programme' and the subsidy scheme for construction of harijan chaupals¹⁰ were the two most important ones financially, in that order. The proposed expenditure for all four women's schemes combined ranks at the bottom. The 'Model Villages Scheme', with a relatively modest proposed outlay, appears to be a programme of considerable political significance. It is listed first in presentation sequences and given the biggest write-up.

The Model Village Scheme is being implemented in Haryana by a rural development board. Its political attractiveness is evident from its composition. The governor of the state is the chairman, and the development minister is the vice-chairman. The 26 other members include five ministers and three non-official members. The model village scheme aims to provide certain 'basic modern amenities' for the villages selected. Only those villages are taken up whose panchayats contribute at least 25 per cent of the development cost.

The 'Low Cost Rural Sanitation Programme' is the one given top priority by the state government in financial terms, and in terms of their discussions with central government officials. Funds from several sources are being pooled. These include funds under the Community Development Block Programme, under a UNICEF-assisted rural sanitation programme, and the funds allocated to the Low Cost Rural Sanitation Programme itself. The Eighth Plan proposals envisaged provision of sanitary facilities to 75 per cent of the rural population. It appears also that the Haryana government plans to spend substantially more on toilets than the government of India guidelines envisaged. In this case, as in so many others, the materials versus wage costs components appropriate

In the Haryana context, including Haryana's expectations and aspirations, may be different from the proportions found acceptable in some other regions.

The expenditure proposed for these three rural amenities schemes – model villages, rural sanitation and the CD Block Programme scheme – is greater than all IRDP schemes combined, and about the same as the JRY/NREP programme as originally proposed. The cost of the harijan and backward class chaupal programme is greater than the outlay of the state's Drought Prone Areas programme.

Aside from the chaupal schemes, Haryana has had a large number of special schemes for harijans, many of them focused on education. It appears that some sensitive but otherwise cynical administrators, think that these programmes, at least, are worth pursuing. A series of evaluation studies have been conducted, by and large, favourable reports [Government of Haryana 1981, 1982]. One of the earliest was the Post Matric Scholarship scheme for scheduled castes, a centrally-sponsored programme, which is rated as a success. The major problems have beenordinate delays in scholarship disbursement and the amount of the scholarships, which was inadequate to cover hostel fees and books.

Aside from this scheme, interest free loans are available from the Haryana government to post matric scheduled caste students for purchase of textbooks and stationery. The industrial training department also provides free education, hostel accommodation, medical services and clothing plus a stipend to SC students enrolled in engineering and non-engineering courses in industrial training institutes. There are two industrial training institutes specially for harijans. The state also provides a monthly merit scholarship to SC girl students who have secured at least 60 per cent marks to pursue their studies from ninth to 11th classes. For SC girls studying in primary and middle classes, there is a free uniforms scheme, and for all SC students there is a special coaching classes scheme for those studying science, mathematics and English. While problems of inadequate funding and implementation are reported, a series of evaluation studies on these programmes [Government of Haryana 1979:9] indicate that they are considered effective.

Aside from these schemes focused on education, there are a large number of schemes for 'economic uplift', from loans and subsidies for drinking water wells, housing and purchase of productive assets, to legal assistance to help harijans fight their cases involving harassment on account of untouchability, ejectment, correction of girdawari¹¹ and 'to protect themselves against exploitation by landlords'.

The main conclusion of an overview study focused on economic uplift schemes was

that scheduled castes needed to be provided more benefits and facilities through regular programmes and 'general sector schemes' [Government of Haryana 1979:56]. This stand is best interpreted as yet another assertion of the greater effectiveness of mainstream 'trickle down' mechanisms as opposed to targeted ameliorative programmes, operated piecemeal. But the special harijan educational and other programmes most likely are destined to continue their independent existences. They are supported by sections of the bureaucracy; their performance is considered respectable; and in addition they have undoubted appeal to a significant segment of the electorate.

The Haryana Old Age Pension Scheme, however, by any reckoning must be counted the most outstanding element in the entire gamut of social welfare, employment generating, and other poverty alleviation schemes. The 1992-97 Draft Five-Year Plan sets aside for old age pensions more than three times the allocation to all the rural development schemes put together, including IRDP, DPAP, JRY, NREP, land reforms, community development and panchayats. In the more ambitious 1990-95 version, the figure was even higher, both in absolute and in relative terms – four times the outlay now proposed for rural development schemes. The difference between the two Eighth Plan editions is the product of political jockeying, financial stringency, and pressures from the central government, reportedly, to target the scheme more exactly. The scheme in short, has an interesting history.

Haryana introduced the old age pension scheme as a social assistance programme for old people without any means of support in the 1960s. In June 1987 the scheme was 'liberalised', so that all persons of Haryana domicile, aged above 65, not paying income tax and not drawing any other pension above Rs 100 per month, were entitled to receive it. In 1990-91 more than eight lakh people received pensions of Rs 100 a month under this scheme, which cost altogether in that year close to 85 crore.

For the Eighth Plan the state is said to have proposed what they called a new scheme, but which is actually a modified version of the existing scheme. The eligibility age threshold has been reduced to 60 years, and other new eligibility criteria have the effect of restricting the coverage somewhat so as to benefit the relatively poorer sections of society. To this end a variety of norms have been listed, relating, *inter alia*, to the area of land owned, if any; total income of all family members including dependents; and with a number of categories of persons explicitly excluded, in particular those whose children hold senior government jobs, are professionals such as doctors, pay income tax, or are sitting members of parliament, MLAs, or chairmen of boards and

corporations. The entire exercise of redefining eligibility criteria, however, does not seem to have drastically reduced the expenditure proposed by the state government to be included in the Haryana Eighth Plan. The new 1992-97 plan estimate is three quarters of the old one for 1990-95. The number of persons to be covered in the first year is more than 6.11 lakh persons instead of the 7.77 lakhs who received pensions in the last year of the Seventh Plan. Central government officials are therefore of the view that the entire coverage should be provided for out of non-plan sources. Although in this case the state government seems to have given in on the question of eligibility criteria, they expect to succeed in getting the 'new' scheme included in the Eighth Plan.

One result of the rise of this and similar programmes¹² is that in Haryana, social welfare schemes in recent years have come to occupy a pre-eminent position financially in Haryana's five-year plans, and the power sector has been demoted to second place. Thus a peculiarly 'modern' approach to providing for the 'weaker sections' seems to be emerging in the state. Social welfare schemes and educational assistance are to be provided to those who cannot be expected to compete, while the adult and able bodied are to be taken care of in the normal course of rapid economic development and its by-product, a change in the structure of the workforce in favour of non-farm activities. Most of the conventional anti-poverty schemes not only take a back seat in terms of financial outlays, they are also perceived as having played no role in the observed reduction in the incidence of poverty in rural Haryana over the years. Evaluation report accounts of the operation of these programmes in Haryana support the view that the employment and asset creation programmes, in particular, really did not have much of an impact in terms of poverty alleviation.

A word should be said, in addition, about the influence of central government views on stated priorities within approved programmes. Aside from the Haryana pension plan story, two other instances illustrate the character of the pressure. Drafts of the Haryana co-operation department's proposals for the Eighth Plan justify demands for increased staff by saying that: "The government of India is laying much stress for the successful implementation of the scheme under PDS in ...this office". Reference is also made to the recommendations of a "Sub Group constituted by the government of India for the development of Consumer Co-operatives". But the factual position is that most of the 33 central government co-operative stores under CONFED have been suffering – "heavy losses" because of "lack

FOR A COMPANY
THAT WAS FORMED
BEFORE 1947,
FREEDOM IS NOT
JUST ANOTHER WORD.

The freedom to perform, the freedom to decide and, above all, the freedom to be oneself. Since the day ACC was formed in 1936, our way of working towards and achieving our goals has been designed to get the best out of our people. Today, we've achieved significant results in everything we do. Be it improved manpower productivity or better energy efficiency or getting acknowledged by stakeholders as India's

most respected company in the Business World and Marg poll. It has only been possible through commitment to technology, to innovation, to an honest approach to doing business, to our people and to the entire nation. And now, as India is in the midst of a new economic freedom movement, ACC is an integral part of it too. As it has always been.

• Cement • Refractories • Consultancy • Engineering • Advanced Material

ACC

business expertise as well as administrative incompetence" "These problems have compelled these stores to stop business" The Eighth Plan draft proposes to rehabilitate at least four of the 25 stores in the red' the draft goes on to highlight the importance of these stores, in principle and to outline a plan of financial assistance under a scheme in which the GOI underwrites 75 per cent of the cost and the state government 25 per cent The stores which are to be rehabilitated are in urban areas As is clear from the above discussion on the NSS 42nd round evidence successive Haryana governments have taken little interest in providing foodgrains through the PDS in rural areas Under land reforms documentary and other evidence shows that the state's initial first priority was a set of schemes relating to the modernisation of revenue administration including a pilot project to computerise land records followed a distant second by proposed outlays on consolidation of holdings and third by financial assistance to landless labour The outcome of discussions with central government officials was a reordering of priorities in which consolidation of holdings was pushed up to first position

The fact that the adjustments which have to be made are of this kind provides further evidence that Haryana perceptions and priorities reflect a political economy which refers to rely almost exclusively on trickle down processes while the central government would rather combine investment in economic development with programmes to help those who are unable to claim their due share of the fruits of planned development

IV Recapitulation

The Haryana experience suggests that sustained growth in agriculture plus a liberalised policy of income and occupational diversification is the most effective cure for poverty Public interventions through centrally sponsored programmes for poverty alleviation have been strictly peripheral to the observed reduction in poverty over the last 25 years Public expenditure on some of these programmes has been to a large extent a waste of money The state government is just not interested in them in their present form They would rather use the money to invest in rural infrastructure, agriculture and in industrial development Heavy investment in raising the productivity of the major commodity producing sectors and in creating infrastructure combined with broad-based social welfare schemes to cover the aged, the infirm and programmes such as those to subsidise the educational expenses of scheduled caste students, is the preferred

poverty reduction strategy of this relatively prosperous state

This strategy, on the face of it, has worked Haryana's head count poverty ratio which was always one of the lowest in India has been declining continuously to the point where Haryana now enjoys the second lowest incidence of poverty in the country Moreover, despite population growth the absolute number of poor people in rural areas has gone down over the past 25 years Secondary data based studies reveal that aside from economic growth this welcome result has been the product of improved distribution Thus in Haryana economic growth has been associated with a reduction in consumption inequalities which was especially marked during the agriculture led growth phase in Haryana development As the green revolution matured the expansion of non farm employment played a key role in poverty reduction among the landless or virtually landless rural households A series of studies demonstrates also that in these developments the quality of rural infrastructure was crucial Investment in the upgradation of rural infrastructure it appears is still the most effective anti poverty programme in sight

Having said all this attention still needs to be drawn to Haryana's discreditable health mortality sex ratio and sanitation record This record reveals that trickle down processes cannot be relied upon to generate benefits outside the strictly economic sphere There are it appears no automatic spread effects into either the social or the political spheres

Politically Haryana governments continue to be dominated by rural landed interests Despite the very rapid growth of organised large scale as well as small scale industry manufacturing interests have failed to establish an effective political presence Representatives of industry have not participated effectively in defining the development strategies of successive governments However there are some signs that their influence is now increasing Given present trends and increasing emphasis on diversification of the output and workforce structure the political pre-eminence of the erstwhile bullock capitalists may be expected to diminish with time but immediate shifts in the balance of political power are not in prospect Past Haryana strategies and priorities may therefore be expected to continue even though the trickle down process may be moving now into a new predominantly industry-led phase

Management of Poverty Alleviation Programmes in Karnataka

An Overview

Vinod Vyasulu

There are two areas in which Karnataka may have lessons to offer other states in regard to poverty alleviation programmes. One is in the creative integration of scientific and technological R and D efforts with such programmes; the second is Karnataka's brief experience with panchayati raj and decentralised planning. Both are necessary, but not sufficient, conditions for a successful poverty alleviation programme; sustained economic growth is also required.

"I know what 'it' means well enough, when I find a thing", said the duck: "it's generally a frog or a worm. The question is, what did the archbishop find?" The mouse did not notice this question, but hurriedly went on "... found it advisable. . . How are you getting on now, my dear?" it continued, turning to Alice as it spoke. "As well as ever" said Alice in a melancholy tone: "it doesn't seem to dry me at all." "In that case", said the Dodo solemnly, rising to its feet, "I move that the meeting adjourn, for the immediate adoption of more energetic remedies"

— Alice In Wonderland
by Lewis Carroll

IN this paper the poverty alleviation programmes of Karnataka are surveyed. Section I introduces Karnataka state within the Indian context. This is followed by a brief analysis of growth and the composition of state income in Section II. Section III discusses the poverty scenario and Section IV the role of R and D inputs into programmes of rural development and poverty alleviation, which is a unique aspect of Karnataka's experience. Section V discusses the effects of decentralised local self-government, once again unique to Karnataka, on the management of poverty alleviation programmes. The conclusions are presented in the last section.

I

Karnataka in National Perspective

The present-day state of Karnataka has inherited several traditions and cultures. Hyderabad-Karnataka districts such as Raichur and Bidar have been shifted from the nizam's administration to Karnataka's; the Bombay presidency areas, like Belgaum and Dharwad, likewise; Dakshina Kannada was part of Madras presidency. Kodagu was a category C state that joined Mysore. After Mysore was formed in 1956, the old Mysore tradition of administration became the common one, but it is important to remember that it was grafted on to various earlier traditions. It is also important to remember

that Mysore had an enlightened and respected civil service. (There are cases of persons who, having got into both the ICS and the Mysore civil service, chose the Mysore service as the more prestigious one. Later, it was merged into the IAS, a separate KAS functions at the district and secretariat levels.) Historically, there has been a dependence in Mysore for the provision of social services on the civil service, unlike say, in Gujarat. And, in all fairness, the civil service by and large was responsive to the needs of its citizens. To that extent, government programmes have that much more importance in Mysore in the context of development and welfare than in some other states; but they also have a positive tradition to fall back on.

In terms of population, the state ranks eighth, accounting for 5.31 per cent of the total population of the country. According to the 1991 (provisional) census, the total population of the state is 4.48 crore and has increased by 20.69 per cent over 1981-91; below the all India growth rate but with considerable inter-district variations. There are clear regional differences, with north Karnataka having features similar to the Hindi heartland in demographic terms – thus Bidar can be compared to Rajasthan – and Dakshina Kannada having features similar to Kerala. The other districts fall in between. But in spite of this variation, Karnataka is a progressive, middle ranking state in India.

It is not only in terms of population or SDP that Karnataka is a 'middle order' state within India. Indicators such as female literacy and infant mortality rates have in recent years been used as correlates of backwardness and poverty – most successfully in the construction of the Human Development Index by the United Nations Development Programme. Since the Centre for Monitoring Indian Economy (CMIE) provides such data at the district level, four such indicators – female literacy, per cent of agricultural labour to total workforce, size of average operational landholding, and IMR of children below two years of age were examined (Table 1) to see where Karnataka stood in the country. These data were

available for 411 districts in India (excluding Jammu and Kashmir and the north-eastern states) and the mean was used to represent the all India average. It is only in the case of size of operational holdings that Karnataka had 11 out of 20 districts below the all-India average. When the 25 'worst' districts of the country on each indicator were listed, only one district of Karnataka appeared in the list – percentage of agricultural labour. On the same indicator, four districts appeared in the 'worst' 25-50 group. Thus, on the other three indicators, no district of Karnataka was among the 50 'worst' in the country. Even if the 100 'worst' districts were listed, only Raichur appeared for female literacy; Shimoga and Chitradurga, in addition to the others worse off, in percentage of agricultural labour; and Mandya in size of average operational landholding. There was no Karnataka district in the 100 worst districts of India on below two IMR (Table 2).

When the top or 'best' 25 districts of the country are listed for all the four indicators, two districts of Karnataka appeared in the list – Bangalore for female literacy and Uttara Kannada for below two IMR. On the same two indicators, four districts appeared in the 'top' 25-50 group: Dakshina Kannada and Kodagu in case of female literacy, and Bangalore and Kodagu in case of IMR. On the other two indicators, no district of Karnataka was among the top 50 in the country. Among the top 100 districts less than half of the districts of Karnataka appear in the list (Table 3).

Under Bose's (1991) concept of OLR (overall literacy rating), Karnataka has an intermediate status – of category B, with OLR at 68.5 per cent. 17.8 per cent of its population are in category A districts, 68.5 per cent in B districts and 13.7 per cent in C category districts. (A category districts are those where male and female literacy levels are above 50 per cent; B those where literacy is above 25 per cent for both males and females; C those where female literacy is less than 25 per cent, but where male literacy may be above 50 per cent too).

In Karnataka the largest district in terms of population in 1991 was Bangalore (4.8 million); the smallest was Kodagu (0.5 million). The 1981-91 growth rate of the largest district was 38 per cent; that of the smallest 5.1 per cent. The total literacy rates were 66.2 per cent (Bangalore) and 28.8 per cent (Raichur); and the gender difference in literacy rates (GDLR score) calculated by Bose was 23.6 per cent and 11.7 per cent (i.e. male literacy rate - female literacy rate). Taking all this together, Bose classifies Karnataka as a demographically progressive state, along with Kerala, Tamil Nadu, Andhra Pradesh, Maharashtra, Gujarat, Punjab and Himachal Pradesh.

The sex ratio in the state has consistently been adverse - dropping from 983 females for 1000 males in 1901 to 960 in 1991 - except for Dakshina Kannada and perhaps Hassan district, where it is favourable. In gender terms, this does not speak well for the status of women. Poverty alleviation programmes must therefore target poor women if the objective is sustainable development. To the extent that these indicators are correlates of poverty, Karnataka is not as badly off as many other states in India. If we can go by this district level data. It is also not among the best. It is clearly, within the Indian context, a 'middle' state, and its policies and programmes, if they are to be realistic must reflect this relative ranking. To put it differently, such programmes may be important to reduce/prevent distress in the short run, but the future lies in promoting economic activity and strengthening various linkages so that the resulting synergy sustains the growth/development process over the medium and long term.

There is unevenness in the distribution of infrastructure in the state. Bangalore is a metropolis on par with the 'mahanagars' of India, but the other cities are far behind. There is excessive conglomeration in the capital located in the south-eastern corner of the state. Bangalore dominates Karnataka just as Calcutta dominates West Bengal. It is five times larger than the second city of the state. This is in stark contrast to Kerala and even Tamil Nadu. Power is largely hydel based; roads are barely adequate. The railway network, divided between broad and metre gauge, is quite inadequate. Bangalore is linked by broad gauge to only a few of the district headquarters. This has its impact on industrial location, as the nature of railway links encourages location in Bangalore because of the hindrances of trans-shipment of goods if located in otherwise suitable places.

While a great deal of empirical work on Karnataka's economy and polity has been done in the last two or three decades, much remains to be done in the field of the economic

history of this state. Compared to West Bengal, Tamil Nadu and Andhra Pradesh, Karnataka has been relatively understudied. Thus, within the Indian context, Karnataka, while stuck in a low equilibrium trap, also had less population pressure on land compared to the other southern states; it enjoys a climate that did not ravage it with earthquakes, floods, etc. There is poverty, but it could be tackled given a relatively efficient civil service, a large number of research institutions with development concerns, an overall progressive social milieu, and sufficient political will. Unlike, say, Kerala, it has not been the scene of political mobilisation and mass movements. Caste factors play a role in the political process, and that role is sometimes positive, sometimes not. Unlike Kerala or West Bengal, movements on the basis of class are yet to emerge. It is in this overall context that Karnataka's plans, aspirations and successes must be understood.

II Growth and Composition of State Income

Karnataka is a middle income state. The state domestic product at current prices increased from Rs 169.64 crore in 1960-61 to Rs 19613.58 crore in 1990-91 (Table 4). Per capita income has increased from Rs 295.7 in 1960-61 to Rs 4367.85 in 1990-91, amounting to a 1337 per cent increase with a 9.07 per cent growth rate. During the 1980s the increase in the per capita income was 173.65 per cent, with 9.58 per cent growth rate. In terms of constant prices, per capita income has increased by

only 32.25 per cent, i.e. from Rs 1596.1 to Rs 2110.94, accounting a 2.57 per cent growth rate between 1980-81 and 1989-90 even though net state domestic product grew at 4.46 per cent during the same period. This low level of real growth may be explained in part, in terms of the rapid increase in the price level and the population, and in part by stagnation in agriculture. In certain years the increase in state income has been marginal, and in certain other years such as 1985-86 there has been a decline; but the fluctuations have not been around a rapid rising trend.

In the 1980s, there was drought in almost every other year in some part or other. Along with the failure of the monsoon, the excessive dependence on hydel sources of power has also contributed to low growth. Frequent power cuts resulting from inadequate power supply have been causing problems for farmers using energised pump-sets. Industry has had to learn to survive in a power starved environment. Yet, energy is used inefficiently. This has been the subject of much debate in the late 1980s. This debate has led to the elaboration of a new paradigm DEFENDUS - but policy lags behind.

Traditional systems of water-harvesting, like tanks in Kolar, have fallen into disuse thus shifting the burden to large irrigation projects alone, and the record of large projects has been dismal. Traditional systems have broken down and have not been replaced by new functioning systems. Water management systems are in flux though there are small signs of hope also.

The performance of irrigation and power has not been very impressive as the irrigation potential created has not been commensurate

TABLE 1 INDICATORS OF DEVELOPMENT KARNATAKA

District	Female Literacy (Per Cent)	Agricultural Labourer (Per Cent)	Average Operational Holding (Hectares)	IMR
Bangalore	59.71	9.00	1.80	79
Bangalore rural	32.86	NA	NA	NA
Belgaum	32.47	26.00	2.50	99

with investment during the Seventh Plan – the problem of the poor capital – output ratio. Only about a quarter of the net sown area in the state has irrigation facilities, the lowest amongst the southern states. Even in the best of circumstances, Karnataka is never likely to have more than 50 per cent of its area under irrigation. Thus overemphasis on irrigation as against developing dry land technology is an error in the Karnataka context. (These issues have been cogently discussed in V M Rao's presidential address to the ISAE annual conference at Hyderabad, December 1991.)

There is a considerable time lag in utilising the irrigation potential created, incurring huge costs under major and medium irrigation projects; this is in part due to delay in command area development (*Economic Survey, 1990-91*). Another factor is that during the three consecutive years 1987-88, 1988-89 and 1989-90, there has been a sizeable shortfall in public investment and also cuts in plan outlays in the core sectors of irrigation and power. Given the fiscal crisis, this problem is likely to continue. Scarcity of funds, inadequate levels of project management, and undue emphasis on large projects to the neglect of water harvesting techniques based on people's participation in a decentralised environment of self-governance, have contributed to this situation

AGRICULTURAL SITUATION

It may be noted at the outset that there have been no structural changes in agriculture in Karnataka through land reform. If there were reforms – in the 1970s – they were tenancy reforms, and given that land distribution was not very unequal in Karnataka (compared, say, to Bihar), the reforms did not bring about much change. Feudal type exploitation in Karnataka was not based on land ownership but on control of resources and credit. Thus a person owning two hectares would work on the land of another owning a similar amount as a hired labourer. It has been argued by Narendar Panik (1981) that the Karnataka land reforms of Devaraj Urs were 'reforms to pre-empt change'.

Kohli also expresses scepticism:

Strong leadership and patronage-based support facilitated the implementation of some redistributive programmes. Conversely, however, exaggerated claims were made on behalf of these small successes. The tenancy reforms of Karnataka especially require scrutiny. The evidence indicates that while some achievements were made, several serious qualifications on the reformist performance are in order: (1) reform policies in Karnataka were not aimed at securing the redistribution of surplus lands; (2) given the size of the

tenancy problem, the achievements are not all that significant; (3) those who lost their lands were not the well-entrenched landowners in close association with the ruling faction; and (4) the beneficiaries of reforms were not always, and not even predominantly, the rural poor.

Thus, the option of growth via changes in agrarian structure was ruled out in Karnataka. Perhaps the fact that there has been no agricultural revolution in Karnataka can be linked to this political choice by its ruling elite. But that is another story.

An analysis of agricultural growth in the state at the district level brings out the broad contours of economic growth in the recent past. Growth rates of area under production

of major crops have been analysed for the period 1980-81 to 1989-90 (Tables 5 and 6). During the 10-year period, the net area sown has recorded a compound growth rate of 0.79 per cent, from 98,98,612 hectares in 1980-81 to 1,07,07,803 hectares in 1989-90. The total irrigated area has increased at a compound growth rate of 4.41 during the same period, from 13,60,733 hectares to 20,94,282 hectares. Coming to the area and production of principal crops in the state, the area under food crops has grown at a rate of 0.62 per cent, from 71,03,809 hectares in 1980-81 to 75,56,417 hectares in 1989-90, while the production of food crops has increased by 0.43 per cent. But the major food crops of the state, viz, rice,

ragi and jowar, have shown negative growth rates in production. The area under these three crops grew at the very small rates of 0.09, 0.80 and 0.89 per cent respectively. This essentially means that food crops production has reached a plateau and that there is only small growth in the area under food crops. Productivity per hectare could not have grown at all.

Growth rates of production of food crops vary immensely across the districts. Many of the rice growing regions like Uttara Kannada, Chitradurga and Mysore show negative growth rates in production; Raichur district shows a growth rate of 1.90 per cent for the same. Many ragi and jowar growing districts have registered a decline in production. For example, in the case of ragi, Bangalore (-1.76 per cent), Mysore (-3.53 per cent) and Gulbarga (-3.50 per cent), Bidar (-4.22 per cent), Dharwad (-4.06 per cent) in the case of jowar.

As far as cash crops, pulses, sugarcane and groundnut are concerned, they show a positive growth rate in both acreage and total production. Area under sugarcane has increased by 9.21 per cent while that of groundnut by 5.67 per cent. Production of sugarcane and groundnut increased by 6.40 per cent and 7.46 per cent respectively. Cotton has recorded a decline in terms of area under cultivation, whereas the total cotton produced has grown at a positive rate.

Area under pulses has increased at a rate of 1.10 per cent whereas production shows a decline of 0.66 per cent.

This implies that cultivation of cash crops like sugarcane and groundnut has increased during this period; but the productivity increases are dismal. This is the crisis of Karnataka's agriculture.

INDUSTRY SECTOR

The analysis covers the period 1960 to 1980 and is based on the ASI data on the census sector that is, those that are factories and excluding some small and most of informal sector production. This provides districtwise information on key performance indicators like value added, employment, etc. The data for the 1980s has not been processed by the bureau of economics and statistics; hence the need to limit the analysis to these years only and that too at an aggregate level as even two-digit level data are not available. Two distinct phases can be discerned in the movement of trends for most of the variables. After a period of slow and gradual increase (roughly up to 1972-73), input, output, (and hence value added) underwent a rapid and near exponential growth in the later period. Though the magnitude of these variables differed across

the districts, compound growth rates showed very little variation. The compound growth rate of industrial value added for the state during the period was 6.54 per cent with Dharwad and Uttara Kannada setting the maximum and minimum limits respectively (13.75 per cent and 1.12 per cent) (Table 7)

This somewhat optimistic picture is slightly offset by the relatively dismal performance on the employment generation front. Employment figures reveal a marginal increase and seem to be hardly affected by the increases in value added. The overall employment growth in the state is of the order 5.7 per cent over 1960-80 (Table 7).

Employment growth was highest in Bijapur and Raichur where the base is low (12 per cent each) while Dakshina Kannada showed a negative growth (-34 per cent). This indicates that industrial growth has not been adequately backed by employment generation. To put it differently, industries seem to have developed along capital-intensive lines. If one may see this in another perspective, this suggests little diversification of economic activities in rural Karnataka – the little industrialisation that has taken place is probably of the 'enclave' type.

A look at some key ratios (Table 8) for the two time points (1961 and 1981) clearly brings out the nature of industrial growth in the state over these 20 years. Employment/number of factories has in fact declined in seven districts, while some districts reveal substantial increases. However, overall state figures show only a marginal increase, 297 to 332. Value added/employment ratios have increased tremendously across all the districts. However, this would, considering the growth in invested capital, be more of an indicator of increasing capital intensity of production rather than any improvement in labour productivity. Capital/output ratios appear to have risen in most districts, implying a deterioration in the efficiency of use of capital.

Another interesting phenomenon has been the high growth in emoluments, especially in relation to employment growth. This would mean that disparities among workers have risen, whereby existing employees have managed to improve their share with employment levels remaining stagnant. This too supports the hypothesis of 'enclave' type industrial growth with little or no forward and backward linkages to the rural areas.

To sum up, a plateauing of foodgrain production and sluggish increase in employment appear to be major constraints to growth; and hence to a reduction in poverty levels. In fact, a rank correlation analysis of agricultural production and industrial value added for the year 1980 tends to suggest a strong relationship between the two (a rank correlation coefficient 0.58, significant at 0.01 level). This would imply that agricultural growth is an essential prerequisite for industrial development – not a very surprising statement.

If poverty alleviation programmes are not to be a permanent aspect of public policy, they must facilitate productive employment generation. Not everyone believes that this can be best done by measures to promote equity. However the problem of employment generation can also be tackled in part by effective government intervention through measures that increase demand through an increase in the purchasing power of the majority, to provide markets for wage goods and by other measures like encouraging

generation of appropriate technologies which reduce drudgery and/or increase productivity, rather than programmes that generate jobs but not assets, skills, products, etc. Since fundamental changes have been politically ruled out in India, Karnataka, given the advantage of the fact that a large number of academic/research institutions are located there especially in Bangalore, has made efforts to do just this; this is discussed in Section IV.

III Poverty Scenario

While on the one hand, the growth of state income has not been very impressive, on the other hand, whatever increase has taken place has often not been reaching the poorest of the poor. One indication of this is the proportion of agricultural labourers in the total workforce which has been on the rise over the years. It has increased from 14 to 32 per cent between the 1961 and 1981 censuses. In fact "the dependence on agricultural labour is a plausible sign of chronic poverty" [Rao 1989].

The incidence of poverty by occupation (Table 9) reveals that the intensity of poverty is higher among agricultural labourers than other sections of the population of Karnataka. Those who do not have any land or have only small amounts of land are the ones bearing the brunt of poverty. On the other hand, the incidence of poverty is the lowest among employees in the service sector. However, since the primary sector contributes a substantial share of the state domestic product (though it has declined over time), without its share in employment declining

proportionately, a majority of the belong to the rural population.

The figures on the composition of income (Table 10) reveal that, while contribution of the primary sector declined from 62.69 per cent in 195 to 34.3 per cent in 1989-90, that of secondary and tertiary sectors increased from 11.45 and 25.86 per cent to 28.6 and 37.1 per cent, respectively even in 1981, more than two-thirds of workforce were dependent on agriculture for their livelihood.

The NSS data on household consumption expenditure for the year 1983 (Table show that the poorest 10 per cent of

Source: As in Table 5.

population in Karnataka spends less than 4 per cent of the aggregate consumption expenditure. The mean monthly per capita expenditure of the poorest decile on food is Rs 33 which actually consists of three-fourths of their total expenditure. This is less than one-fourth of the food expenditure of the highest decile.

The unemployment situation was better in Karnataka compared to all-India. Table 12 presents the incidence of unemployment, i.e., number of persons (age five+) unemployed in the labour force) for the 2nd, 38th and 43rd rounds of NSS for Karnataka as well as all-India. Unemployment rates were found to be relatively lower in rural areas compared to urban areas. The data also reveal that the 'current status' unemployment rates are higher than the 'usual status' rates, indicating 'not continuously unemployed' mount those categorised as 'usually employed'. Chronic unemployment rates (i.e., usual status), seem to have remained almost at the same level for males, i.e., about 1 to 2 per cent in rural areas and around 6 per cent in urban areas, over a decade, i.e., from 1977-78 to 1987-88. However, in the case of females, there has been a decline (by 83 per cent) in the early 1970s and a subsequent increase (by 88 per cent) during the early 1980s in rural areas, and a gradual decline in urban areas.

A 7.2 per cent growth in population was matched by 3.4 per cent growth in employment in rural areas, compared to 20.2 per cent population growth in urban areas matched by 15.8 per cent growth in employment, between 1983 and 1987-88. Clearly, growth of job opportunities has been inadequate.

Various estimates of poverty compiled by a study group on anti-poverty programmes (government of India 1990) in Karnataka suggest a decline in the percentage of the rural population living below the poverty line. The Ahluwalia study (1978) shows a decline from 49.1 per cent in 1960-61 to 4.74 per cent in 1970-71; that of Kakwani and Subba Rao (1990) shows a decline from 52.5 per cent in 1972-73 to 42.6 per cent in 1983. Poverty estimates of the Planning Commission (1985-90) reveal a decline from 48.3 per cent in 1977 to 35 per cent in 1983, and those of the World Bank (1989) reveal a decline from 54 per cent in 1970 to 41 per cent 1988. Although it is not intended to go into the debate on the various estimates and their accuracy, it clearly emerges from the figures that the estimates of the Planning Commission are far below those of any other estimate. This is true especially for the year 1983. Minhas et al (1991) have recently attempted to explain this, but that is another story.

POVERTY ALLEVIATION PROGRAMMES

With regard to poverty alleviation, Karnataka is grouped in the category of states with the lowest decline in the incidence of poverty. The report (government of India 1990) also states that regional disparities in poverty in these regions (inclusive of Karnataka) have increased and regional concentration of poverty has become more pronounced.

To gain further insights, reference may be made to the fundamental work of V M Rao (1988), from which we quote:

It is useful to categorise the anti-poverty programmes into three broad groups, representing the three distinctive but complementary approaches to the problems of poverty:

(a) minimum needs programme, consisting of schemes to provide infrastructure and amenities essential for improvements in the rural living conditions, indicative of the approach of delivering a wide range of development inputs and services free or at nominal cost;

(b) employment programmes intended as a direct measure to generate and support incomes of rural poor; and

(c) programmes like IRDP promoting self-employment activities capable of helping the poor to become viable and development-oriented.

The scale and composition of the anti-poverty programmes in Karnataka during the Sixth Plan (1980-85) are indicated in Table 13.

It can be seen from the table that anti-poverty programmes formed a substantial component of the Sixth Plan, accounting for about one-sixth of total expenditure. However, it is equally relevant to note that a full 80 per cent of the anti-poverty

expenditures went towards giving relief to the poor-provision of minimum needs and employment generation – and only 20 per cent was spent on the self-employment programmes focused on the objective of making the poor viable. A plausible way of explaining this composition weighted in favour of relief rather than viability is the following. Given the wide spectrum of policies available to the policy-maker to help the poor, governments in developing economies with non-radical democratic regimes find it both easy and politically convenient to adopt an anti-poverty strategy relying primarily on relief measures. The relief measures produce immediate and palpable benefits for the poor, evoke less resistance from the rural strong and rich, and are within the capacity of a rule-cum-procedure-bound bureaucracy to set up and administer.

An interesting question to ask in this development setting is whether the planning system would be able to achieve smoothly the progressive shift needed in the development strategy from relief to viability

TABLE 9: INCIDENCE OF POVERTY BY OCCUPATION, 1983

Occupation	Proportion of Poor
Workforce in industry	0.69
Workforce in service sector	0.5
Workforce in agricultural and allied activities of which:	0.62

Source: Computed from ASI data.

Assuredly, unless such a shift is achieved, the system will not only find itself helping more and more poor without overcoming the problem of poverty itself. It would seem appropriate here to mention two common features of the rural situation in Karnataka. First, an outcome of the extensive relief-like programmes is the growing dependence of the rural poor on government assistance and the emergence of strong political lobbies putting pressure on such assistance on a continuing basis and expanding scale. When such assistance is forthcoming fairly easily, as at present, many among the rural poor are likely to be unwilling to bear the risks, delays and anxieties involved in taking up self-employment activities. Second, failures in IRDP often traced to inadequate co-ordination, linkages and implementation procedures arise, in fact, from basically weak markets for the product or activity owing to deficiency of demand or availability of attractive urban products.

The scale of expenditure alone is not enough to indicate the significance of anti-poverty programmes in the developmental efforts of Karnataka. As a further indicator, we give in Table 14 the results of a rough exercise done by us based on the data for a recent year, 1983-84, to estimate the coverage of the poor by the two major individual-oriented programmes, viz. employment generation and asset creation. The exercise was done for the state as a whole and for the four broad regions in Karnataka. In Table 14 the regions are arranged in ascending order of a proxy for agricultural productivity, viz. gross value of agricultural production per hectare, shown in column 2 of the table. While no precision could be claimed for the results given in the table, the indication that about 11 per cent of the poor were covered in a single year – half each by the two programmes – appears to be a reasonable basis to assume that these programmes are substantial enough to have an impact on the condition of the poor.

The other clue given in Table 14 is that there is no simple and discernible

relationship between agricultural productivity on the one hand, and the coverage and composition of beneficiaries on the other. A priori, it is possible to think of two mutually contrasting hypotheses about this relationship. If the programmes are markedly focused on the backward areas, one would expect a negative relationship to show up between agricultural productivity and the coverage of poor, especially the coverage by asset creation programmes. On the other hand, the relationship between agricultural productivity and coverage of poor would be positive if the government programmes tend to favour the relatively developed areas offering easier and more responsive conditions for taking up such programmes. To judge from the inter-regional variation seen in Table 14, the situation in Karnataka does not fall neatly under either of the two hypotheses, possibly, being an outcome of contradictory pulls and forces.

Another point to bear in mind is that, in terms of meeting the targets of expenditure and of number of beneficiaries to be covered, the performance of IRDP in Karnataka and in its four main regions was quite satisfactory. Tables 15 and 16 contain the relevant information for the first four years of the programme. It is obvious that years and regions with shortfalls in achieving the expenditure and beneficiary targets were few, and that the programme recorded noticeable acceleration in the last two years included in Tables 15 and 16. By way of a further indicator of IRDP performances, Table 17 shows that the percentage of scheduled caste beneficiaries to total beneficiaries is growing over time, with the increase being particularly marked in the relatively backward plains area. However, the acceleration of IRDP over the first four years appears to have been achieved at the cost of a thinner spread of the credit disbursed by the programme (Table 18). The credit disbursed per beneficiary declined sharply in the last year preceded by an unsteady pattern in the first three years. Thus, the overall picture that we get from Tables 15

through 18 is of a programme picking momentum in aggregative terms but at the cost, perhaps, of diluting the help and attention given to individual beneficiaries.

REGIONAL VARIATIONS IN POVERTY

In Karnataka poverty, as may be expected is not uniform across all the districts. Data reveal that there are considerable disparities across districts in terms of development. In the absence of poverty estimates at the district level an attempt has been made to study the disparities in terms of district levels of development and other indicators like occupational pattern. The index of levels of economic development calculated by the Centre for Monitoring Indian Economy (CMIE) reports (Table 19) for the years 1980 and 1985 reveals that Bangalore, Kodagu, Chickmagalur, Shimoga, and Bellary are clearly on the higher level, with Dakshina Kannada reaching a very high level during 1985. The districts at the lowest level include Gulbarga, Tumkur, Kolar and Bidar. Apart from Dakshina Kannada the districts that experienced an improvement (in relative terms) in development by 1985

are Belgaum, Dharwad, Chitradurga, Uttara Kannada, Gulbarga and Tumkur. On the other hand the districts that fared the worst are Kodagu, Mysore, Raichur, Kolar and Bidar. This index suggests that while regional disparities have persisted over time, there is a marginal decline in the disparity, as measured by Sen's Gini Coefficient during his period (Table 19).

Per capita current income at the district level, which is another indicator of disparities, reveals that in 1960-61 (Table 20), while Kodagu's per capita income was Rs 727.50, the highest among all the districts, Bidar district had the lowest per capita income of Rs 199.24. Altogether there were seven districts which had per capita incomes above the state average of Rs 295.72. In 1988-89 eight districts had per capita incomes above that of the state average (the districts are not the same in these two years). Kodagu retained its top position with its per capita income of about Rs 6,910, while Kolar had the lowest at Rs 2,422. There was a gradual decline in income disparity from 1960-61 to 1980-81 followed by a marginal increase in the late 1980s. While there is a substantial improvement (in relative terms) in income in the districts Bangalore, Belgaum, Gulbarga and Mysore, the districts of Hassan, Kolar, Shimoga and Tumkur have had a setback. In terms of the rankings in per capita income of various districts during 1960-61, the districts of Bidar and Raichur were on a lower level of development, and they have had a further setback in 1988-89. Although the per capita income of these districts has had an increase in its absolute size, in relative terms there is a setback.

Agricultural productivity and growth changes between 1961-81 and 1981-86 have been described by Vivekananda (1992). There are a few districts which have achieved high growth from a high base – they include Mandya, Shimoga, Mysore and Belgaum. The districts with a high base and medium growth are Dakshina Kannada, Chickmagalur, Hassan, Tumkur and Bellary. There are certain districts which have not performed well despite a high base – Kodagu, Uttara Kannada, Kolar and Bangalore. On the other hand, there are certain districts that have achieved high growth on a low base – Chitradurga, Bidar and Raichur. Last, certain districts continue to have low growth on a low base – Dharwad, Gulbarga and Bijapur.

Vivekananda has also studied agricultural development and distribution of gains across various regions of Karnataka. On agricultural development *vis-a-vis* the occupational pattern, the regions with high agricultural development have lower participation in agricultural labour, and vice versa. It can be observed from Table 21 that even with regard to the change in the occupational pattern,

the backward districts have experienced a greater increase during 1961-81 in agricultural labour than the developed districts. Based on this, one may infer that the extent of poverty has been on the increase in the backward areas. Vivekananda claims that sustained growth of agriculture has led to a significant withdrawal of females from the workforce. In less developed districts like Raichur, Gulbarga, etc., the increase in female agricultural labour is very high.

INSTITUTIONAL CREDIT

Karnataka has fared well in terms of banking activity. A few indicators, like population served per branch, which was 41,000 in 1969 (as against 69,000 at the all India level), was reduced to 10,400 in 1989 (as against 13,800 at the all India level). In terms of branch expansion also, Karnataka has fared well as the number of commercial banks has increased from 761 in 1969 to 3,200 (approximately) by March 1991. Table 22 shows the growth in deposits and advances. While deposits in commercial bank branches have increased from Rs 255 crore during 1969 to Rs 8,951 crore during 1989, advances have increased from Rs 186 crore to Rs 8,377 crore during this period.

While the participation of these financial institutions in the removal of poverty can be appreciated, skepticism has been expressed in various field-based studies regarding the efficacy of these programmes in aiding the poor. Bank credit is very often biased in favour of the larger farmers. This is mainly an outcome of the hold a large farmer has over the co-operatives and his better accessibility and acceptability to

commercial banks [Rao 1988]. Also, follow-up facilities are not provided by the system. As a result many of the poor who avail of credit facility from the banks end up selling off the asset. The target approach and the intervention of politicians have also been contributing to a great extent to the less than satisfactory performance of these programmes. The IRDP is a gigantic arithmetic operation to cover every year a specified number of poor dispersed all over the country [Rao 1988:2413].

Many loopholes have been highlighted with regard to the performance of various programmes. First, mis-identification has been one of the main drawbacks. This is due to the fact that many political functionaries are intervening in the operation. Mis-identification to the tune of 1 to 4 per cent has been estimated in the mid-term evaluation attempted by the government of Karnataka (1987).

With regard to the Rural Landless Employment Guarantee Programme (RLEGP), although the programme was not totally successful, the benefits of RLEGP reached the poor to some extent [Vivekananda 1989].

देना बैंक

(भारत सरकार का उपक्रम)

DENA BANK

(A Government of India Undertaking)

We serve and grow.

People, relationships and impeccable service have always been a way of life at Dena Bank. And have been so since 1938.

Today the Bank serves the entire nation with 1,151 branches spread out all over the country.

A Bank that also commands a huge deposit base exceeding Rs. 5,700 crores.

But where Dena Bank really scores is in the area of its multifaceted banking activities. From offering customer - oriented deposits and growth schemes including consumer and housing loans. To specialised banking services like Merchant Banking, Investment Banking, Housing Finance,

Agricultural Finance, Credit Cards... the list is endless.

However, what still matters is the fact that, the Bank may have changed with time. It's ideals haven't. What started as a family bank, remains, a family bank even today. With the same customer friendly, personalised style. Only in a more modern avatar.

Another positive effect is that as a result of this programme there was less crowding in the labour market for agriculture. However, there are certain weaknesses. Works are assigned to contractors, hence there is no guarantee that the target groups get the employment, and target fulfilment rather than poverty alleviation is the main worry of the officials implementing the project. Because of this, selection of beneficiaries was not attempted properly by the concerned functionaries.

The most important poverty alleviation programme linked to institutional credit is the Integrated Rural Development Programme (IRDP). This programme was started in 1981-82 and the bank credit support for it has been substantial. A mid-term review in 1986 revealed that banks had assisted more than eight lakh people who were below the poverty line and extended credit support to the extent of Rs 182 crore. The subsidy amounted to Rs 72 crore. Per capita net credit given in the state was Rs 2 102 as against the national average of Rs 1 872. The initial target of covering 1 05 lakh families per year in a state was first met by Karnataka.

With regard to the performance of the Integrated Rural Development Programme (IRDP) Rao and Aziz (1989) have expressed dissatisfaction. Although the IRDP has an impressive spatial spread and beneficiary coverage, the support has been highly inadequate. In the absence of any arrangements for backward and forward linkages, this programme is serving the relief needs of the beneficiaries rather than helping them to become economically viable. Ironically, the programme has had some impact on the rural poor who have and but much less on the landless poor. Competitive politics rather than long term development planning for the poor appears to be the chief source from which the IRDP strategy derives its stimulus and sense of priorities.

Regarding interventions in the areas of technology extension and credit, Rao (1988) notes that benefits derived from the new technologies accrue more to large farmers.

Thus the technological change in agriculture is a factor intensifying the degree of differentiation among the farmers by increasing the economic distances among the three categories: (a) those making substantial gains, (b) those becoming viable but not affluent, and (c) those remaining non-viable. The viable farmers are likely to find many areas of common interest with the large farmers while the non-viable are prone to find their economic status drifting down to the levels of landless labourers (1988:2411).

This, to some extent, substantiates the earlier finding that inter-regional disparities

and income inequalities among individuals have not been substantially reduced in Karnataka, despite substantial intervention by the government.

Summarising the performance of the anti-poverty programmes, Rao notes that "our anti-poverty strategy has no credible component of new economic opportunities for the lowest rural stratum. This implies that this stratum will have

to rely chiefly on the politicisation route towards the main stream" (Rao and Aziz 1989:16).

If the experience of Kerala is anything to go by, the importance of the politicisation route cannot be underestimated - especially in a state like Karnataka which has ruled out options like agrarian reform in favour of technology based solutions to which we now turn.

IV R and D Input

A direct attack on poverty was introduced in the Fourth Plan, although there were stray attempts, such as land reforms and community development programmes, during the earlier plans. They are of different types – self-employment, additional employment generation, skill formation, area development, welfare schemes for weaker sections, minimum needs programmes, and the like. These are by and large centrally sponsored programmes. At the state level, Karnataka has many state sponsored programmes such as Anthyodaya, Neglubbhagya, Rural Employment Guarantee Scheme and the like. They follow the same pattern as the central schemes. The expenditure on some of these programmes in the 1980s is shown in Table 23.

A feature unique to Karnataka, as far as I know, is the systematic effort to link up R and D efforts in scientific research institutions to rural development. In 1975, the Karnataka State Council for Science and Technology (KSCST) was set up, with the chief minister as president and the finance minister and the director of the Indian Institute of Science, Bangalore, as vice-presidents. The director of the Indian Institute of Science serves as chairman of the executive committee of the council and an eminent scientist functions as its secretary and chief executive – first Amulya Kumar N Reddy of the Indian Institute of Science; and more recently, B R Pai of the National Aeronautical Laboratory, Bangalore.

It is thus a body that brings together political authority, the rural administration and scientific talent. The objectives of the KSCST are:

- to identify areas for the application of science and technology to the development needs, objectives and goals of Karnataka, and, in particular, to the prevailing conditions of backwardness, rural unemployment and poverty;
- to advise government on the formulation of policies and measures including technical, administrative and legal devices, which will promote such applications to identified needs, objectives and goals; in particular to health, education and manpower utilisation with special emphasis on the development of human skills in the rural areas and in the slums; and which will promote the scientific management of the natural resources of the state;
- to promote effective co-ordination and to develop and foster communication and other links between centres of scientific and technological research,

government agencies, farms and industries so that promising research and development work is initiated, promoted and effectively deployed in agriculture, in government and elsewhere.

- to initiate, support and co-ordinate applied research programmes in universities and other institutions in areas identified to be specially suitable for the application of science and technology.
- to prepare science and technology plans relevant to the development needs of the state;
- to consider and advise the government on such other matters as are relevant to the application of science and technology to the problems of Karnataka state.

The KSCST has been active in mobilising the considerable scientific resources available in the state to meet these objectives. An indication of its activities is given in Table 24. It may be noted that the expenditure on R and D projects is not a negligible proportion of the expenditure on anti-poverty programmes. In recent years, the efforts of the KSCST are also being brought down to the district level. Consider the following efforts (Table 24). In order to ensure a perennial drinking water supply in the villages, the government of Karnataka undertook a massive programme of drilling borewells and fitting them with handpumps in the 1970s. More importantly, the focus was on maintenance of handpumps. By the mid-1970s, large scale failure of handpumps (60 per cent) was reported. The KSCST studied the nature and causes of failure and came out with useful solutions. Engineers of the PHE department were trained, as were village artisans, in handpump repair and maintenance. Thus the repair capability is available at the panchayat level and provides opportunities for part-time employment to the local youth in new areas.

Another major effort by KSCST has been directed towards generating biogas for water pumping and illumination. A water supply and electricity distribution system has been designed for an entire village, improving per capita water consumption from 17 to 21 litres and also ensuring at least one 20 watt fluorescent lamp for each house, thus contributing to the literacy effort, and, once again, both providing some employment *in situ* as well as strengthening village level self-reliance.

One more important achievement has been in the development of efficient kilns for burning of bricks and tiles. Break-throughs have been made in improvement of the thermal efficiency and in modelling of the thermal process of tile and brick manufacture. This, coupled with the generation of new building technologies

using local materials, can go a big way toward setting up village based industries that would generate employment and income.

Women have benefited from the development of an efficient wood-burning stove, the smokeless 'astra ole', of which several lakh have been installed. What is interesting here is that the technical input have been of the highest order. The equations to describe combustion in the 'astra ole' represent frontier level science not applications of knowledge available in undergraduate text books. But it has also made clear the need to translate the

problems of the poor in rural areas to scientific R and D questions that will interest scientists. It has also shown how important it is for scientists to have first hand experience of rural areas and poor people, and to get feedback from them to improve their designs. And in this there is need for collaboration with social scientists and grassroots activists. It has shown that there are no quick solutions – the efforts of R and D have to be planned and efficiently managed. Even after technologies have been developed there are formidable problems of dissemination. If the KSCST experience is any indication a span of less than 10 years is simply unrealistic.

All this it must be noted may constitute a necessary condition for the success of poverty alleviation programmes – not a sufficient one that again emerges from Karnataka's experience.

V

Towards Decentralised Management

There was a major change in the management of poverty alleviation programmes with the Karnataka Zilla Parishads, Taluk Panchayat Samithis, Mandal Panchayats and Nyaya Panchayats Act of 1984 which took a long time to get the assent of the president. While panchayat raj concepts have a long history the Karnataka experiment of the 1980s was piloted by Ramakrishna Hegde and Abdul Nazir Sab at the political level. But there were many in different walks of life who supported the experiment.

These institutions came into operation from April 1, 1987 after elections were held and continued till the end of 1991 when the new government superseded these institutions through an ordinance. (This supersession was challenged in the supreme court who ordered that elections to these bodies be held by June 30, 1993.)

This act has enabled the creation of an institutional framework for planning and management at the grassroots level. Zilla parishads, mandal panchayats and grama sabhas constitute the institutional set up in implementing programmes for the area. They are meant to make improvements in the development programmes in the sense that they are designed to suit the requirements of the area and set priorities according to needs. This is a radical measure aimed at effecting decentralisation of powers and finances and is meant to ensure self-governance by people at the local level.

As Chandrasekhar (1986) writes, these institutions are entrusted with "local government and judicial functions and the execution of certain works and development schemes of the State Five Year Plans", and

for "decentralisation of powers and functions for the purpose of participation by the people on the plans and in local and governmental affairs". The values of self-governance, growth of democratic institutions and participation are recognised as necessary for the promotion of a more equitable and dynamic society in rural Karnataka.

In the system, below the state the district is the unit at which decentralisation begins. It is the level at which technical competence, possible development of old and new technology, the methods of transfer of technology, organised human resources etc. are available. Below the zilla parishad (an elected body) is the taluk panchayat samithi (a co-ordinating body), then the mandal panchayat – an elected body. The gram sabha is the fourth or grassroots level. From among the elected members of the zilla parishad one will be elected as adhyaksha and another as upadhyaksha with the ranks of

minister of state and deputy minister in the state government, respectively. The chief executive of the zilla parishad will be an IAS officer of middle level seniority, reporting to the adhyaksha, who writes his confidential performance report. This ensures the accountability of the civil service to the political authority. Once provision of finances have been made in the state budget the money is automatically transferred to the zilla parishad. This is an important innovation in Karnataka. There is a provision for a finance commission which will determine how state funds are shared among districts over a five-year period. One commission has submitted its report.

The tier next in importance to the zilla parishad is the mandal panchayat – an area with a population of not less than 8,000 persons and not more than 12,000 – with scope for specific exemption in the hilly Malnad areas. There are also reservations of seats – 25 per cent for women, and at least 18 per cent for SC/ST. There are many innovative provisions which cannot be further discussed here – but the literature on this issue is quite large. The point to note is that compared to a system in which development works were decided upon and managed by officials, this system ensures people's participation and local accountability.

To this extent, Karnataka's case is different from others, with the possible exception of West Bengal. This is in view of the fact that developmental responsibilities have been delegated and transferred to panchayat raj institutions and rural development and poverty alleviation programmes are among them. The empowerment of the mandal panchayats to levy taxes and the zilla parishads to charge licence fees, collect rents from property and raise loans with the approval of the state government, is expected to enable the zilla parishads and mandal panchayats to supplement their funds. The funds for these organisations otherwise mainly consist of transfers from the state government.

The system has been evaluated by a high powered committee set up by the government of Karnataka when the system had been operational for two years, with K. S. Krishnaswamy as chairman and L. C. Jain and P. S. Appu as members. The evaluation was based mainly on visits and discussions at various levels. First questionnaires were canvassed among the concerned functionaries such as heads of departments and secretaries to the government of Karnataka, the main functionaries of panchayat raj institutions like adhyakshas, chief secretaries of zilla parishads, and a random set of pradhans of mandal panchayats. Responses were sought with regard to the achievements, statutory

provisions, administration and financial arrangements, sanctioning powers, programme implementation and planning system for development. Discussions were later held with the respondents and other officers of zilla parishads. Inspectors in the field were also consulted. What follows is based on the report of this committee.

Many of these institutions have used these powers to good advantage to supplement the finances transferred by the state government. They have mobilised substantial sums by way of donations and contributions from local people for construction of schools and other buildings. In some instances, zilla parishads have used innovative methods to combine local contributions by users of certain facilities with tied or borrowed funds available from other sources, for instance lift irrigation schemes in Bellary and horticulture schemes and seed farms in Raichur. Overall, both zilla parishads and mandal panchayats have

given ample evidence of their willingness and ability to mobilise local resources both real and financial [Government of Karnataka 1989:12]. An improvement is generally expected as this system ensures a constant check on the various functionaries involved in delivering the services.

Analysing the overall performance of the new system, the committee states that the actual performance of zilla parishads and mandal panchayats is an impressive virtue in all districts. The operation of schools and health facilities has improved considerably. Good progress has been made in the allocation of housing sites under various schemes. Performance in the fields of inland fisheries, horticulture and forests has also been good. Generally, development works are being executed more speedily than before and there is better control of field staff.

Satisfaction has also been expressed with regard to the performance of various powers

violation programmes. There has been improvement in the selection of beneficiaries. Implementation of these programmes, compared to the pre-zilla parishad system, captured in the NREP case study discussed above.

This is a good achievement in view of the fact that mis-identification and biased selection of beneficiaries were among the main drawbacks of the programmes. The committee report credits the new system with the improved functioning of poverty alleviation programmes. On the question of identification of priorities and of persons eligible for relief, the report notes that the advantages of the new system have already become noticeable. Local differences have been identified promptly, within the flexibility that they have. Resources are allocated for the purpose. There have also been initiatives on the part of local bodies to use the labour available under RLEGP, NREP or other programmes to construct or repair buildings needed for essential local purposes such as schools, public health centres and community halls.

However, one of the drawbacks of the new system is that gram sabha meetings have been convened in a hurry without giving adequate publicity to the agenda. In some cases attendance was observed to be low and consisted of people mobilised by mandal panchayat functionaries. In some cases there has been criticism of selection of beneficiaries and the priorities effected in these meetings. To remedy this, the committee emphasises the need for strict adherence to the requirements for convening gram sabha meetings. It recommends that the mandal pradhans concerned officers attend these meetings regularly with adequate preparation.

The other remedial measures suggested by the committee include establishing proper institutional linkages between mandal panchayats and zilla parishads. Another area of concern highlighted is the persisting

intervention from the various departments of the state government in Bangalore. The committee stated that "notwithstanding the substantial transfer of power to zilla parishads, the actual operations of these bodies are seriously circumscribed by administrative and financial restrictions. The committee has also documented the efforts of the state secretariat to curb the zilla parishad via circulars; and counselled vigilance on this score (p 94).

Instead of building upon this foundation, the government of Karnataka in 1992 by special legislation superseded the entire system. The cynical could argue that this proves that the system worked well!

VI Conclusion

What emerges from this discussion? A great deal has been spent on poverty alleviation programmes, and there have been leakages in these programmes. But they have also reached the poor and made some impact. They are not a total failure. This would appear to be true in varying degrees of other states as well.

Karnataka depended more heavily than others on irrigation projects. Here, the decline of traditional systems coupled with the low returns to investment on major systems, and the highly politicised implementation of the projects, meant that the complementarity between water and other programmes was lost. This is an area where attention needs to be focused – the area of dryland technology. It must be noted that a foundation for further work, has already been laid in Karnataka [Ninan and Chandrasekhar 1992]. The 'target' approach has led to the programmes being implemented mechanically. The synergy possible at the field level was lost. Karnataka's experience suggests that democratic decentralisation is at least in part the answer to this problem.

There are two areas in which Karnataka may have lessons to offer. One is in giving

a scientific/technological R and D input into poverty alleviation programmes. A promising start has been made, more needs to be done, but other states may learn from this experience. The lessons of experience are sober lessons. The task of harnessing R and D to poverty alleviation and rural development is a tough one. It requires the latest results and the most sophisticated of brains, not old or second-hand knowledge and machinery. In Karnataka, it took about 10 years for tangible results to emerge, e.g., the community biogas experience at Pura showed that even when top level scientists are involved, purely technical solutions in a rural context require systematic research, and creative solutions have to be developed, which takes time and patience. The knowledge does not exist in ready-made, useable form – and this is in Karnataka which had a core of technologists sensitised to the problems of rural areas. Even now, much remains to be done to diffuse and disseminate these technologies. Clearly, that too will require innovative solutions to be developed, and this too will take time. Like all research, it carries risk, but it has potential for high returns. Thus, all these are programmes for the medium term. The research and development infrastructure in Karnataka can, in all probability, provide such support to other states; what is needed is a suitable mechanism to release this scientific energy. Once these programmes yield results, they may be expected to result in productive employment in several areas, thus setting the stage for a gradual reduction/withdrawal of poverty alleviation programmes.

The second is in its brief experiment in panchayati raj and decentralised planning. Here too a promising start was made, but unfortunately, aborted. But much has been learned from this brief experiment; mainly, the need to guard against vested interests, which are many, and to persist with this political innovation.

Both these factors may be seen as necessary conditions in any successful

poverty alleviation programme. It would be premature to conclude that they are sufficient conditions for their success. Further, poverty alleviation programmes need to be seen as temporary measures – their success must mean that they create conditions in which they can be phased out. This implies that the growth processes in the economy have to be reinvigorated. It remains to be seen if the structural adjustment programmes that the government of India is embarking upon will lead to such growth. If radical solutions like basic land reform on the Korean or Taiwan model are politically ruled out; and rural diversification of the village/district economic base does not take place at a faster rate, based on off-farm and non-farm activities; and the many other conditions needed to support such policies do not obtain; then it is difficult to see how such a growth process can be sustained. To this question, research scholars must now turn their attention.

[I am grateful to V S Vyas, Pradeep Bhargava, D D Narula, V M Rao, M Prahladachar and participants of the Jaipur seminars at IDS for critical and helpful comments, to B P Vani for discussions and for helpful quality control, to C Upendranath and M Vijay Bhaskar for cheerful academic collaboration; to K Gayithri and Veerashekharappa who helped in data collection, and to Rugmini for excellent word processing. Remaining errors of fact and opinion, and of omission and commission, are my own.]

Concept

URBAN LAND POLICY

Study of A Metropolitan City

A. Ravindra, I.A.S.

Hardbound

Rs. 300

This is perhaps the first comprehensive study of urban land policy in India. It deals with various issues pertaining to urban land—land values, land use planning, land acquisition and supply and land taxation—in the overall perspective of urban land policy. The study has been carried out mainly in the context of Bangalore metropolitan area. Although it is primarily a micro level study, the issues raised are common to other urban areas in India as also in the developing world.

Dr. A. Ravindra is an officer of IAS cadre and is presently working as Managing Director, Karnataka Power Corporation Ltd. Bangalore.

Declining Incidence of Rural Poverty in Kerala

K P Kannan

In Kerala, the incidence of rural poverty has declined in the 1980s in spite of the slow rate of growth of the economy. The explanation for this is that various state intervention programmes especially the public distribution system have had a positive impact on poverty. The experience of Kerala shows that, with or without growth it is possible to alleviate poverty through well designed and implemented programmes and that social protection for the most vulnerable groups should be a necessary component of development policy.

I

The Problem and Context

During the first half of the 1970s when there was a lively debate on the incidence of poverty in India, Kerala presented a paradoxical picture. On the one hand Kerala had achieved remarkable progress in such human development indicators as education and health but on the other hand it remained one of the poorest states as measured by household consumption expenditure.¹ It is now well known that the achievements in social development were the result of elected state intervention over a long period of time. Such intervention was in turn the result of pressures generated within Kerala society through organised movements. This anomaly between high social development and high incidence of poverty seems to have been overcome in the 1980s with a sharp reduction in the incidence of poverty despite a lower rate of growth of the economy. This paper addresses the latter phenomenon.

With a view to focus the discussion in a broader perspective, we may conceptualise following Dreze and Sen (1990) the problem of poverty alleviation in terms of two dimensions: the creation of entitlements in the sense of the access of the poor to consume commodities (or commodity bundles) presently and the building up of capabilities for a dignified human existence. The first is referred to as 'entitlements' in the sense

the set of alternative bundles of commodities over which a person can establish command, whereas the second is associated with such elements as the standard of living as well as broader aspects of the ability to be socially useful and influential. The interaction of entitlements and capabilities results in a certain functioning: what people do and what they are doing and beings. On the basis of this conceptualisation, we have classified the poverty alleviation programmes in Kerala in Table I. Since the achievements in the sphere of building up of capabilities such as education and health are well known and well documented, we do not discuss them here.

Our discussion here is organised in the following manner. Section II presents a profile of poverty in Kerala in its three dimensions (headcount, poverty gap and its

intensity) on the basis of evidence from consumer expenditure surveys as well as its changing structure. These results based on all India surveys are sought to be tested against the results obtained through a survey on socio-economic and health conditions in Kerala in 1987. Section III deals with the context and the possible routes through which poverty could decline. The extremely limited scope for the trickle down process to work and the active role of public intervention measures are underlined here. Section IV recognises the important role of public intervention in general but deals only with state directed programmes. Section V is a brief case study of food security programmes such as the public distribution system and supplementary nutrition programmes mainly for children below the age of 10. The last section, by way of concluding observations, makes an assessment of the impact of the various poverty alleviation programmes and their sustainability in the context of the constraints on the development of commodity producing sectors in the Kerala economy. We conclude by noting that social protection of the poor, especially those vulnerable among them, is as important as a growth strategy that will ensure adequate employment to the labouring poor.

II

Profile of Poverty

All the indices which measure the extent of poverty rest on the identification of a poverty line. In India, the Planning Commission's norm of a monthly per capita consumption of Rs 20 at 1960/61 prices is accepted as the poverty line. On this basis, Dandekar and Rath (1971) re-estimated and found that a monthly per capita consumption expenditure of Rs 15 and Rs 22.50 at 1960/61 prices delineates the rural and urban poverty lines respectively. Bardhan (1973) worked out the required monthly per capita consumption expenditure on a state specific basis. Accordingly, the poverty line for rural Kerala was Rs 16.10 at 1960-61 prices. This norm attributes a minimum required level of expenditure for sustenance. The second norm defining the poverty line is derived from the first and looks at poverty from a nutritional angle. The norm specifies the poverty line as the minimum expenditure

required for a daily per capita intake of 2,250 calories. Dandekar and Rath (1971) estimated that for Kerala a monthly per capita expenditure level ranging between Rs 34 and Rs 43 corresponds to a minimum intake of 2,200 calories per capita per day. The Planning Commission [Government of India (1979)] redefined the norms as monthly per capita expenditure of Rs 49.09 and Rs 56.64 at 1973/74 prices, reflecting daily per capita intake of 2,240 and 2,100 calories for rural and urban areas respectively. However, the rural poverty line based on the 1960/61 estimate and inflated by the consumer price index for agricultural labourers will work out to only 80 per cent of the above figure of Rs 49.09. Kakwani and Subbarao (1990) have called this the poverty line for the ultra poor. Recently Minhas et al (1991) have calculated the poverty line for rural and urban Kerala at 1973/74 prices on the basis of price index constructed for the middle range population.

There are a number of studies relating to the incidence of poverty in India. We refer here to the recent studies pertaining to the states. Ahluwalia (1978) estimated poverty in rural India and 14 Indian states for the period 1956/57 to 1973/74, measuring absolute poverty in terms of real per capita consumption using head count (HC) ratio and Sen's index. At the all India level, he found that there was marked fluctuation in the incidence of rural poverty declining till 1960/61 and rising sharply through the mid 1960s, reaching a peak in 1967/68 and again declining thereafter. Extending the period to 1983, Mahendra Dev et al (1988) have shown that the incidence of rural poverty at the all India level declined between the period 1964-65 and 1983, particularly after 1977/78. However, the coefficient of variation of poverty occurrence has increased over the years, implying the widening of gaps among the states. Kakwani and Subbarao (1990) studied the incidence of rural poverty for the period 1972/73 to 1983. The trends in poverty gap ratio and Watt's measure showed that the reduction in poverty was more for the ultra poor than for the poor and the magnitudes of reduction in poverty level are higher for the period of growth 1977/78 to 1983 than for the period 1973/74 to 1977/78. Mahendra Dev et al (1991) share the same view; they found that the decline

was more pronounced in the 1980s. Bhattacharya et al (1991) showed for the period 1952/53 to 1983 that the percentage of rural poor rose sharply between 1964/65 and 1966/68. The incidence of rural poverty stagnated during 1970-74 and then registered a sharp decline for the rest of the period. But they conclude that though poverty declined secularly from the late 1960s, the proportion of poor and their absolute number still remain high. As the HC ratio seldom fell below 40 per cent, the study inferred that the bottom 40 per cent of India's rural population have remained chronically poor, and moreover another 20 per cent remained vulnerable to changes in the economy.

Minhas, Jain and Tendulkar (1991) also conclude that there was a sharp decline in the incidence of poverty during the period 1970/71 and 1987/88, the combined HC ratio registered a continuous decline from 56.3 per cent to 45.9 per cent during the entire period. The decline between 1983-84 and 1987/88 is particularly striking because the last year was a bad agricultural year and quite unexpectedly the ratio declined in that year.

As part of the all-India studies, estimates of the incidence of poverty in Kerala are available for a number of years as shown in Table 2. There are some marked features to the trend in incidence in rural poverty in Kerala. First of all, Kerala presents a trend similar to that of all-India; beginning from the early 1960s, the incidence of rural poverty peaked during the mid-1960s and then began to decline since the late 1960s. However, the process of decline seems to be sharper in Kerala with the 1980s registering significant declines in the incidence of poverty. What is significant from the Kerala point of view is that since the beginning of the 1980s Kerala presents a lower incidence of poverty than all-India for the first time. This is borne out by all the studies presented in Table 2. Here the poverty line refers to (i) the Planning Commission's estimate of 1960-61 as worked out by Bardhan for Kerala (1973) and adjusted by the consumer price index for agricultural labourers for estimates given by Mahendra Dev et al (1988), Ahluwalia (1978) and Bhattacharya et al (1991); (ii) Planning Commission's estimate at 1973-74 prices and adjusted by the consumer price index for agricultural labourers for the estimates given by Kakwani and Subbarao (1990), and (iii) the estimate based on the 1973-74 prices index constructed for the middle range population for estimates given by Minhas et al (1991). We have called the poverty estimates of (i), 'chronic poverty', the same as the 'ultra poor' referred to by Kakwani and Subbarao (1990).

As the trend in poverty in rural Kerala is not fluctuating over different NSS rounds during the 1970s and 1980s, we may be tempted to infer that a vulnerable group is

present to a lesser extent in Kerala. It would appear that around 20 per cent of Kerala's rural population have remained chronically poor.⁴ If we consider the estimate of the incidence of poverty given by Minhas et al (1991), then it is as high as 44 per cent for Kerala. In this sense, there is a vulnerable group of poor in Kerala equivalent to the chronically poor.

STRUCTURE OF RURAL POVERTY

From 32nd and 38th Rounds of NSS we note that the majority of the rural poor are within agricultural labour households. The Kerala scenario is similar to the all-India picture with predominance of poverty in agricultural households, as is evident from Table 3. The quantum share of all landless/land-poor labour households in the poverty structure of Kerala stands in contrast to the all-India picture in which the self-employed in agriculture (i.e., poor peasants) is the second biggest segment of the rural poor. The share of self-employed in agriculture in rural poor of Kerala is quite low in comparison to the all-India figures. This might be due to the crop-mix (in favour of cash crops), enabling the generation of high value per unit area. The majority of the poor in Kerala belong to the labour households; they are either assetless or asset poor.

Thus two essential features emerge from the above analysis: (i) there is a declining trend in the incidence of rural poverty in Kerala, the downturn being significant in the late 1970s; (ii) the structure of rural poverty is tilted towards labour households whether agricultural or non-agricultural.

The evidence so far presented on incidence and structure of poverty in Kerala is based on consumer expenditure data, a measure of the income of the poor. In speaking, it is income data that should be taken into account, but there are well known problems in obtaining such data. Income reported by about 10,000 households in Kerala were collected in July 1987 for a study on the health status of the rural population [Kannan et al 1991]. Apart from income and health status, data on a number of other socio-economic characteristics such as ownership of land, education and housing conditions were collected. Interestingly, the per capita income thus derived was close to the per capita state domestic product reported by the department of economics and statistics. This however does not mean there was no under-reporting. On the contrary, it is well known that the SDP measure does not capture the remittances to the Kerala economy. It may be that the under-reporting of household income thus matches that of government sources. Using the income and other socio-economic data (which could be used to

TABLE 1 : TYPOLOGY OF POVERTY ALLEVIATING PROGRAMMES IN KERALA

Aim -> Means	Creation of Entitlements	Building up of Capabilities
Targeted programmes	1 <i>Food security:</i> Supplementary nutrition to the vulnerable among the poor, (e.g. pregnant mothers, pre-school and school-going children up to 10 years)	1 <i>Education:</i> Support for literacy and pre-literacy programmes, financial assistance to village libraries and scheduled caste/tribe students.
	2 <i>Social security payment:</i> To vulnerable among the poor (e.g. monthly pension to old aged and other destitutes, old aged agricultural and other rural labourers).	2 <i>Housing:</i> House building programmes, financial assistance for house building.
	3 <i>Income/employment generation:</i> Integrated Rural Development Programme; National Rural Employment Programme and Rural Landless Employment Guarantee Programme	
Non-targeted programmes in which the poor benefit significantly	1 <i>Food security:</i> Public Distribution System through (i) ration shops and (ii) fair price shops.	1 <i>Education:</i> Free education up to the high secondary level in both public and private (aided) schools
		2 <i>Health:</i> Free health care in public health institutions.

tercheck on under-reporting) we have used a brief profile of poverty in Kerala which closely resembles the profile emerging from the earlier analysis. We examine here the incidence of poverty, the characteristics of the poor, their spatial distribution by districts, non-income dimensions of poverty, and quantification of the chronically poor in terms of income and non-income characteristics.

Using the 1960-61 norm of Rs 16.10 capita per month of consumer expenditure reduced to cross the poverty line in rural Kerala at 1987-88 prices, we found from the survey data that 43 per cent of households and 45 per cent of the population come below the poverty line. For possible under-reporting of income, we resorted to a number of imputations of households to produce an estimated incidence of the poor. Those households in the above group retaining characteristics as ownership of land of less than 2.5 acres, higher educational qualifications of household members, electric roof of the house, use of LPG or electricity for cooking, piped water supply to the house, etc., were eliminated. This leaves us a figure of 30 per cent of households and 31 per cent of the population below the poverty line.

The characteristics of the poor are along the same lines except for one – education. In terms of the structure of poverty, Table 4 shows that three-fourths of the working members in poor households are casual labourers; 44 per cent of them are engaged in agriculture and the other 31 per cent in agriculture. Scheduled castes and tribes have a greater incidence of poverty; they constitute 23 per cent of the poor while their share in the total population is less than 10 per cent. The share of Muslims matches with their share in the total population. Christians account for only 14 per cent of the poor whereas their population share is around 20 per cent. Hindus other than SC/ST also have a lower share: 41 per cent as against their share of 48 per cent in the total population.

On the basis of general living conditions it is possible to identify the broad groups of rural labour households which are poor. Apart from the agricultural labour households, they are mostly from households engaged in fishing in the coastal areas (where population density is around four times the state average of 750 per sq km and living conditions are deplorable); coir processing, in which a large number of women are engaged in beating coconut husks and drying yarn, again in the coastal areas; in factory workers, again predominantly in workers whose poverty is more due to lack of adequate employment (not more than 100 days per year) than to wages; loom weaving, and; other traditional occupations.

Education, or the lack of it, does not come out so strongly as a factor because of the widespread schooling of children in Kerala. As shown in Table 5, though the relatively less educated has a greater chance of being poor, this correlation is stronger only when combined with low wage and/or low employment occupations such as casual labourers in agriculture. To what extent are the income poor, poor by other indicators? To answer this, we analysed the habitat conditions of the poor. Conditions of housing indicate that around 25 to 45 per cent of the income-poor households cannot be said to be poor. As for drinking water, the majority depend on the traditional source — wells — and 39 per cent of them have their own wells. Sanitary conditions are perhaps much less satisfactory; only around a quarter of the households have some private facility. Electrification of poor homes is the least; only 16 per cent of the income-poor reported such a facility.

Since the non-income indicators show some significant differences and do not go along with income levels as reported by the households, we could separate the chronically poor on the basis of these indicators. Since the poor are not uniformly poor on all these indicators, we have used the condition of housing as a visible sign of poverty. By clubbing households with poor housing conditions, 18 per cent of households and 17 per cent of the population were estimated to be chronically poor.

On the basis of the 1987 survey data we have been able to examine the regional dimension of poverty in terms of districts. The results are given in Table 6. The regional dimension is less sharp than the occupational dimension. However, three northern districts, viz. Palghat, Malappuram and Kasargod, are the most poor. More than 70 per cent of the poor are rural labourers in 11 out of the 14 districts. Even those districts which report a much lower incidence of poverty have a higher share of poor among agricultural and other rural labourers. We, therefore, feel that poverty eradication in Kerala should primarily aim at occupational groups with an emphasis on regional development in selected districts in the north, i.e., the erstwhile Malabar region.

III Context of Poverty

With the formation of the state of Kerala in 1956 as part of the reorganisation of Indian states, a distinct sociocultural and administrative entity was created which could pursue a development strategy laid down nationally with some room for modification of priorities and emphasis dictated by local conditions. As a result of the emergence of a radical political movement with strong emphasis on redistribution, there was significant social pressure to reorient the development strategy. This did result in some modest changes of a long term nature, such as the abolition of tenancy in land, as well as progress in social development, especially in such areas as education and health, with distinct benefits to the poor.

GROWTH PERFORMANCE

From the point of view of poverty alleviation, one of the arguments in favour of the need for maximising economic growth *per se* is that it will 'trickle down' to the poor. Even in the absence of state intervention, a sustained process of growth, especially in agriculture, could lead to a decline in poverty through significant changes in the labour market in favour of the poor. A process of labour absorption and consequent increase in employment and wages could significantly raise the income of labour households. This process is likely to be strengthened in the face of increasing labour productivity. This seems to have happened in states like Punjab and Haryana (for the latter see the Haryana case study in this issue). However, such examples of favourable conditions for growth-led decline in poverty through a process of increasing agricultural productivity have been few and far in India. As can be seen from Table 7, the growth performance of the Kerala economy since the early 1960s to the mid-1970s has not been unimpressive; however, it was hardly adequate to increase the per capita availability of employment (in fact it declined). However, the incidence of poverty peaked during this period. The availability of food (due to national shortage) and the high incidence of unemployment among

rural labour households seem to have contributed to this phenomenon. To it must be added the high rate of growth population, reducing the per capita growth in income to around 1 per cent. In contrast the growth performance since the mid-1970s to the end of 1980s has been nothing less than dismal. The primary sector, mainly agriculture, showed negative growth, and there was a deceleration in the secondary sector. Thus the growth of the commodity producing sectors as a whole was less than 1 per cent. The redeeming factor was the growth in the service sector, induced by large scale remittances since the mid-1970s. The rate is likely to have been higher than shown here since remittance income does not figure in the calculation of state domestic product but only of the income generated out of it. Though demographic pressure declined since the mid-1970s, per capita growth was lower than in the first period because of low overall growth. Detailed studies have been done on the performance of agriculture and industry, and the basic reason has been identified as low growth (stagnation) in productivity. The problem has been one of inability of the commodity producing sectors to meet the requirement of dynamic efficiency, i.e., a higher rate of growth of productivity *vis-a-vis* production wage [see, for example, Kannan 1999, Kannan and Pushpangadan 1988, 1999, Subrahmanian 1990]. And yet, during the period since the mid-1970s the incidence of poverty has been steadily declining, reaching a level below the national average since the early 1980s. This decline, despite a low rate of growth of the economy, should be viewed in the context of the enlarged and enhanced public intervention programme to help alleviate poverty.

TABLE 5. PERCENTAGE DISTRIBUTION OF WORKING MEMBERS IN POOR HOUSEHOLDS BY EDUCATIONAL ATTAINMENT

	Education		
	1	2	3
Casual labourers in			
Agriculture	48	26	26
Non-agriculture	40	24	36
Self-employed in			
Agriculture	21	26	53

Permanent workers other than agriculture	2	2	2		1
Total	41	14	22	23	100

Although growth was low, the dynamics economic change in Kerala has been such that changes in the labour market favoured the position of the labouring poor. Though by itself could not reduce poverty, we will first discuss the important routes through which poverty could have been reduced. These are (i) land redistribution, (ii) the role of prices, (iii) demographic changes and (iv) employment and earnings.

(i) *Land Redistribution* At the time of the formation of the state, Kerala was one of the states with a highly skewed distribution of land. Despite having carried out the most far-reaching land reforms in India, the distribution of land has not been altered significantly [Raj and Tharakan 1983] in favour of the landless. Transfer of ownership of land to tenants (since 1971) might have contributed to a decline in poverty insofar as some small tenants were also below the poverty line. But this is likely to have added only a marginal impact since the majority of the poor are landless. Land reform, however, did confer small plots of land on the poor, thus providing the much needed security for dwelling. This could have helped the process of decline in poverty directly through removal of the psychological barriers for bargaining for their wages, thus strengthening the position of agricultural labour unions. In this sense, the effect of such a land reform might have worked through the labour market; this is borne out by the increasing trend in wages, as we shall see later below.

(ii) *Role of Prices* Prices play an important role in determining the purchasing power of the poor, especially the prices of food and other basic items consumed by them. Analysis of the consumer price index for agricultural labourers (see Table 8) shows that the growth rate in Kerala is close to that

of all India, although in recent years the index is growing somewhat higher than all India. Despite the large food deficit, Kerala's ability to hold the price line for goods consumed by agricultural labourers at the all-India rate could be due to the functioning of an effective public distribution system. Thus the movement of prices was no less or more favourable to the poor in Kerala compared to the all-India situation.

(iii) *Demographic Pressure* Demographic pressure in Kerala has been one of the highest in India, resulting in an unfavourable land-man ratio. In the absence of a meaningful redistribution of land

to the landless poor and the slow pace of industrialisation, demographic pressure seems to have contributed to the problem of poverty in Kerala. However, Kerala has been characterised by a demographic transition without a corresponding economic transition since the 1970s. A remarkable result of this process has been the achievement of replacement level fertility by the end of the 1980s [Bhat and Rajan 1990] and a population growth rate of 14.0 per cent during 1981-91, which is expected to decline to around 1 per cent per annum by the end of this century. All this has meant that from now on demographic behaviour has ceased to be a constraint in economic development and particularly in reducing/eliminating poverty in Kerala. Thus the beneficial impact of this development is likely to be felt only in the years to come.

(iv) *Employment and Earnings* Here two kinds of problems have been experienced by the poor. The first relates to the low labour absorbing nature of Kerala's agriculture. Paddy cultivation, the most labour intensive crop, has accounted for less than 30 per cent of the cultivated area. The remaining area is utilised for high value and low labour

absorbing cash crops. Therefore owners of land stood to gain more than workers from the value added. Second, as discussed earlier, the growth performance of agriculture after the mid 1970s has been one of stagnation. Except paddy, all other crops either registered a decline or showed no trend in land productivity [Kannan and Pushpangadan 1990]. The per capita annual days of employment of agricultural labourers also declined for the same period (from 160 to 147 days) as revealed in the rural labour enquiry/employment reports. The performance of the industrial sector, though not as dismal as the agricultural sector, is similar [Subrahmanian 1990]. However, employment growth in this sector has been disappointing. Employment growth in such sectors as construction, trade and services, as a result of remittances, was hardly adequate to alleviate the increasing rate of unemployment. Work seekers registered in the employment exchanges increased from 0.7 million in 1975 to nearly 3 million in 1990; the latter represents close to 30 per cent of the labour force. There may be some overestimation in this source since some of

TABLE 7. GROWTH RATE OF STATE DOMESTIC PRODUCT AT 1970-1 PRICES

Sector	Growth Rate		
	Whole Period	First Period	Second Period
Primary	1.21	2.71	-0.64
Secondary	3.74	4.51	2.78

those who are registered may be engaged in some gainful employment. However, the estimates based on the national sample survey gives an equally alarming picture of the problem of unemployment. The results of the 38th round (1983) showed that the incidence of unemployment as per the usual status criterion was around 11 and 17 per cent for men and women respectively in rural areas in Kerala, as against 2 and 1 per cent for India as a whole. The current daily status incidence of unemployment for the above categories was 24 and 31 per cent in Kerala, which was 2.5 to 3.5 times the rates for all-India. In sum, while employment is a potential means for redistribution of income and reduction of poverty, it has not functioned as such in Kerala as a result of the extremely slow growth in employment.

In this gloomy scenario, there was one route which was favourable to a process of reducing poverty – not a 'trickle down' but a 'forcing down' process. This was the phenomenon of unionisation of workers cutting across regions, occupations, gender and rural/urban distinctions. Since this process was part of a generalised process of political mobilisation and the parties involved came to power at the state level from time to time since the mid-1950s the labouring poor could effectively use their power for bargaining. Though this factor is not a sufficient condition for securing higher wages and other benefits, there is no doubt that it was crucial in the context of Kerala [Kannan 1988, 1992]. Wage rates of agricultural labourers in Kerala for men and women were consistently higher than other Indian states except the agriculturally prosperous states of Punjab and Haryana [Jose 1988]. However there are two factors which determine the real earnings of the poor and which have been discussed earlier, viz, employment and prices. The former was declining, and to offset the effects of the latter growth in money wages should be greater than the consumer price index for the poor. In Table 8 we present the rates of growth in the

consumer price index for agricultural labourers (CPIAL) and the money wages of agricultural labourers and unskilled construction workers in rural areas representing the poor. It is evident from the figures that money wages of the rural poor have been growing faster than the consumer price index and the difference has been widened since the mid-1970s. From the early 1960s to the mid-1970s, the difference in the growth rates of money wages of rural labourers was between 1.3 and 3.6 percentage points higher than the CPIAL, while the difference since then has been between 2.5 and 5 percentage points. The question is: has this been adequate to enable the poor to cross a level of income corresponding to the poverty line? Evidence given in Table 2 points to a reduction in the poverty gap in the early 1980s compared to the 1970s and 1960s. The crucial constraint in this respect is not the wage rate *per se* but the availability of adequate employment.

In respect of employment, per capita annual employment has been declining from 194 and 143 days for male and female agricultural labourers in 1964-65, to 160 and 142 days in 1974-75 and further to 147 and 115 days in 1983-84. The redeeming factor from the standpoint of poverty alleviation has been the increasing rate of growth in wage rates. As we can see from Table 9, during the mid-1960s and 1970s the actual income of agricultural labour households was around half the required income to cross the poverty line, whereas with reduced per capita employment it was nearly 90 per cent in the early 1980s. This is consistent with the decline in the poverty gap measure given in Table 2. However, this was still not adequate to help cross the poverty line.

Therefore, neither historical antecedents nor growth performance and structural features of the Kerala economy were conducive to a process of reducing poverty without directed state intervention and other forms of public action emanating from the organised poor.

IV Context of Public Action for State Intervention

Though not elaborated here, state intervention in reducing poverty in Kerala should be seen in the overall context of public action. The major thrust of the socio-political environment was towards issues of distributive justice. Towards the end of the colonial period there were two major issues. One was the question of land reform aimed at easing, and later on abolishing, the burden of the tenants. The other was the socio-reform movement aimed at socio-emancipation of what were referred to as backward and depressed classes. The demands of these movements took the form of, among other things, access to education and government jobs. Perhaps this was directed at emancipating the poorer classes among the socially deprived, but within the context of nationalist politics, and later socialist politics, the poorer sections became one of the important political constituencies. It is this context which gave an explicitly distributive thrust to the policy of Kerala state since its formation. The coming to power of pro-poor political parties gave an impetus to this process but even those political parties who might not be characterised as pro-poor had to go some way in meeting the demands and aspirations of the poor as an electoral strategy, at least. One may say that the poor were moved from a position of clients to that of citizens. They were able to articulate their rights and demands through organised movements as well as through political parties. It is in this context that one has to view the state policies and programmes in Kerala, with a wide base for building up human capabilities in general and programmes for the alleviation of poverty in particular. State intervention in the Kerala context should therefore be seen as a response to public action on distributive justice over a long period of time.

TABLE 9 : ACTUAL AND POTENTIAL INCOME OF AGRICULTURAL LABOUR IN KERALA IN RELATION TO REQUIRED INCOME FOR CROSSING THE POVERTY LINE

Year (1)	Required Income ^a (2)	Actual Income ^b (3)	Potential Income ^c (4)	(Rs/year)	
				(3) as Per Cent of (2) (5)	(4) as Per Cent of (2) (6)
1964-65	1,474	813	1,225	55	83
1974-75	5,254	2,068	3,704	49	87
1983-84	6,148	4,863	10,343	89	188

Notes: a Required income is based on the per capita income required to cross the poverty line at 1960-61 prices and inflated by the consumer price index for agricultural labourers taking into account the average size of the household.

b Actual income is taken from the Rural Labour Enquiry Reports and the 1983-84 survey of rural labour households by the department of economics and statistics, government of Kerala. It includes non-wage income which contributed 11 per cent in 1983-84.

c Potential income is the total of actual income if employment is provided for the days reported as not worked due to want of work at the prevailing wage rate.

The poverty alleviation programmes (PAPs) considered here include not only those that are designated as such. Following the classification given in Table 1, we examine here those programmes aimed at the creation of entitlements to the poor. These are (i) food security (ii) social security, and (iii) income and employment generation.

FOOD SECURITY

(i) *Public Distribution System (PDS)* The rationale for PDS arose as a result of the food deficit nature of the state due to its specialisation in non food crops. The PDS was started in 1964 covering the entire population, excluding those who produced enough for their own consumption. The coverage is more than 90 per cent of the total households in the state. Over a period of time the PDS has established itself and now has two components. One is informal rationing through a network of ration shops (numbering around 13 000) which are spatially well spread out. In 1981 the number of families with ration cards was 41 lakh (i.e. 93 per cent of total households) and in 1991 50.6 lakh (i.e. 90 per cent of total households). Nearly two thirds of the total cereal purchase of poorer households are

met through the PDS, the highest in the country.

(ii) *Supplementary Nutrition Programme (SNP)* The SNP has come to occupy an important role in food security because it is targeted at the vulnerable among the poor. The first component of supplementary nutrition covered in 1987/88, around 1.28 lakh pregnant mothers and 6.72 lakh pre-school children. They represent around 20 per cent of the total pregnant mothers and children below five years respectively annually. The second component of SNP caters to school children in classes I to IV (and wherever class V was attached to primary schools) and covered more than 70 per cent of the total children in this group up to the end of the 1980s. Because of the crucial role of these two programmes in alleviation of poverty we have dealt with them in greater detail in section V.

SOCIAL SECURITY PAYMENTS

These payments involve a unilateral transfer of income from the state budget to those who are identified as weak and unable to participate in the economic process. These are the various kinds of monthly pensions that now cover destitutes of all kinds

physically and mentally disabled and old aged workers in agriculture. Since 1989/90 the monthly pension scheme was extended to cover aged workers in non agricultural occupations as well. In terms of coverage it has increased from 1.3 lakh persons during the end of the 1970s to 5.19 lakh by 1987/88 and 5.75 by the early 1990s. As a proportion of the total population in the state in the age group of 60 and above in 1991 the number of persons covered by the old age pension schemes account for about 20 per cent. If we assume that all those who receive such pensions are genuine and we have good reasons for believing so in view of the vigilance of various political parties and their unions and the checking measures of the village officers, this could be taken to represent another measure of the incidence of chronic poverty in Kerala.

OTHER PROGRAMMES

(i) *Integrated Rural Development Programme* Started on an all India scale in 1978-79 this has been an important poverty alleviation programme of the central government in the 1980s. The programme was extended to all community development blocks in Kerala since 1980-81. After identifying the poor families in rural areas (a procedure which does not seem to follow the official measure of poverty nor have an adequate mechanism to check the validity of the reported income) financial assistance is extended by way of loan and subsidy to

1983	53.9	8.5	62.4
1984	54.1	6.0	60.1 (51.1)
1985	55.5	4.4	59.9
1986	61.5	3.9	65.4
1987	59.3	3.9	63.2
1988	56.4	5.5	61.9
1989	45.4	7.5	52.9 (60.7)
1990	57.9	8.1	66.0
1991	58.0	11.6	69.6 (67.8)

Note: The average family size was taken as 6.0 till 1980 and 5.7 from 1981-91 to estimate the total number of persons. The per capita distribution could be marginally lower than the actual because a small quantity of rationed commodities are distributed to institutions such as hostels. Figures in brackets indicate five year averages except the last which is a two year average.

take up economic activities capable of generating income to cross the poverty line. The number of families benefitted and the total financial assistance extended are given in Table 10. Clearly, the inadequacy of the financial assistance, not to speak of the nature of activities, is an important drawback and hence its limited impact, even after more than a decade, in alleviating poverty. Given the thin line dividing the households on the basis of the poverty line as well as the scope for leakage, inclusion of households which are not eligible by official criteria has also been a problem. According to a study by the state planning board (1983), around 23 per cent of the households selected were ineligible ones. This however is only one of the problems in the implementation of the IRDP; there are a number of others including that of marketing of products.⁷

(ii) *Rural Employment Programme*: This was also started in the national context of emergency programmes of employment through public works to meet the widespread drought situation in 1971-72. Later this was formalised under two heads, the National Rural Employment Programme (NREP) and the other targeted for landless rural labourers, the Rural Landless Employment Guarantee Programme (RLEGP). These two were merged in 1989-90 and is known as Jawahar Rozgar Yojana. The financial outlays, employment generated and foodgrain used to pay part of the wages (so as not to add to inflationary pressure) are given in Table 11.

These measures, if effectively implemented, would have a favourable impact on poverty in rural Kerala through generation of employment in slack seasons. However, the impact seems to be very marginal. In terms of additional mandays generated they do not add up to much, a mere five to six days per annum per rural labourer in the mid-1980s. However, the combined impact of all the poverty alleviation programmes listed in the beginning of this section seems to have been such as to reduce the incidence of poverty in rural Kerala. An approximate quantitative assessment of this impact emphasising the need to improve the quantitative benefits to the vulnerable section, as well as an employment-oriented growth strategy, are discussed in Section VI.

V

Food Security System: Case Study

This section is concerned with an elaboration of the food security system as it obtains in Kerala. The selection of food security is intended to emphasise its crucial role in poverty alleviation in a state which is chronically deficient in the production of food due to its specialisation in non-food crops. As it exists now, the two main

components of the food security system in Kerala are (i) the public distribution system (PDS), and (ii) the supplementary nutrition programme (SNP) for children and pregnant women.

PDS AS FOOD SECURITY

The PDS in Kerala, as it is organised today, was started nearly three decades ago, in 1964. The coverage is almost the complete population, around 95 per cent, leaving only those who declare sufficient production for their own consumption. The PDS has two components. One is a system of informal rationing through a network of nearly 13,000 ration shops, the other is a system of fair price shops through which a number of essential items are sold. The importance of the latter is only marginal since the quantity distributed is only around 10 per cent of that distributed through the ration shops.

The effectiveness of a public distribution system to reduce poverty depends on a number of factors. These are: the availability of essential commodities on a regular basis, affordability to the poor in terms of the prices of these commodities *vis-a-vis* in the open market, the share of these items in the total purchase; spatial coverage of the public

distribution as between rural and urban areas; physical access to the shops and above all the credibility of the PDS as a food security system to the poor. Although the PDS in Kerala is still constrained by a number of factors, including the inability of the state to obtain greater allotment of rice from the

TABLE 16. BENEFICIARIES OF SCHOOL MEAL PROGRAMME

central government, very low quality of rice distributed, highly inadequate distribution of cooking oil, etc. it seems to meet the above mentioned factors reasonably well given the overall constraints, thereby gaining the credibility of the people in general and the poor in particular as a food security system.

Our main thesis has been that the decline in the incidence of poverty in Kerala below the national level has been largely induced by a number of state directed programmes. With regard to the PDS we can see from Table 12 that the total quantity of essential commodities has been increasing. But the real test of availability should be seen in terms of per capita distribution as presented in Table 13. This shows that the per capita distribution has been increasing steadily since the early 1980s for all essential items.

On the question of price share of rural areas and share of the PDS in total purchase some useful information is given by the 42nd Round of the national sample survey. These are presented in Table 14 for Kerala and all India. The prices of essential commodities distributed through the PDS in Kerala are marginally higher (except for sugar) than all India which could be due to the higher costs of transportation (due to the geographical location of the state and the spread of the ration shops within the state) as well as handling costs. However these prices were lower than the market prices obtaining in Kerala. In 1986-87 the price of rice in the ration shops was 65 per cent of the open market price while that of sugar was 75 per cent. The distribution of the commodities as between rural and urban areas shows that in Kerala the rural sector obtained slightly more than its share in population. In 1981 the share of rural population was around 81 per cent which declined to 74 per cent in 1991. Therefore the share of rural population in 1986-87 is likely to be around three-fourths. Excepting edible oil, the rural sector received more than its share in the population. This is in contrast to the all India picture except in the case of rice and sugar. However, much more crucial is the extent of dependence of households on the open market for essential commodities. This shows that nearly all the requirement of wheat and kerosene and more than half for rice and sugar are met by the PDS in Kerala. However, only a small fraction of the cooking oil requirement is met by the PDS. Rural households have a marginally lower dependence on the open market than urban households. This again is in sharp contrast to the all-India situation, where the dependence on the open market remains quite high except for sugar (for rural households) and kerosene (for urban households). At the all-India level, rural households have a greater dependence on the open market than do urban households.

In terms of poverty alleviation, the market dependence criterion should be seen in terms of the poorer households rather than all households. As per the NSS 42nd Round results, the bottom 20 per cent of rural households meet nearly two-thirds of their requirement of cereals and sugar and all their requirement of kerosene from the PDS.

In the changed national context, serious problems have developed with regard to the state's ability to sustain the PDS. As part of the new economic reforms, the central government withdrew the subsidy to the foodgrains allotted to the states beginning from April 1992. This has meant an increased burden of Rs 156 crore per annum to the Kerala government. Since the fiscal situation of the Kerala government is in a state of crisis, the government has decided to stop the subsidy except for the poorer households. This has unleashed a controversy in which an argument has been made for retaining the subsidy in view of the vulnerability of the state with regard to availability of food and prices. If the government restricts the subsidy to the poor, it will have to take into account both the chronically poor (as in most estimates) as well as those poor who are just above the chronically poor but remain within the alternative estimate of poverty, as in the case of Minhas et al (1991). This means nearly half the households will have to be considered poor for obtaining subsidised foodgrains and other commodities from the PDS.

SUPPLEMENTARY NUTRITION PROGRAMME

This programme consists of two components: one, SNP for pregnant women and pre-school children, and the other school meals programme for children in the primary schools. These programmes have been in existence for more than two decades.

As can be seen from Table 15, the coverage of the SNP for pregnant women and pre-school children was expanded significantly only from the early 1980s. The objective of this programme is to combat malnutrition by providing 300 calories and 15 grams of protein per child, and 500 calories and 25 gm of protein for pregnant and nursing mothers for 300 days in a year. The programme is implemented through a network of nearly 12,000 'anganwadies' managed by educated (usually high school and above) young women who receive a very small honorarium of around Rs 250-350 per month. Health personnel visit these centres periodically and provide health care services and educational programmes.

In addition there are two associated programmes, viz., the applied nutrition programme through which women are helped to develop kitchen gardens, preparation of nutritious food with locally available materials, etc. Under the composite

programme for women and children (CPWC), child care centres such as the anganwadies and other facilities are built.

The ratio of pregnant women to children below five years is around 1:6. On this basis 1.3 lakh pregnant women were benefitted by this programme annually since the early 1980s. This works out to around 22 per cent of the total pregnant mothers in the state. The number of pre-school children benefitted also works out to around 22 per cent of the total children in the age group. This could be reckoned as another measure of poverty in the state. As for the impact on nutritional status, more detailed studies would certainly be needed. However, it is not without significance that an assessment of the Integrated Child Development Scheme, a central government programme under which

TABLE 17 MONEY EQUIVALENT OF BENEFITS OF VARIOUS POVERTY ALLEVIATION PROGRAMMES TO RURAL LABOUR HOUSEHOLDS (Rs/rural labour household)

	1983-84	1986-87
PDS (rice only)	624	468
School Meals Programme	120	139

TABLE 18 IMPACT OF VARIOUS STATE INTERVENTION PROGRAMMES ON POVERTY ALLEVIATION

	1983-84	1986-87
1 Combined benefits of all programmes given in Table 17 per rural labour household (Rs)	1395	1594
2 Benefits per capita ¹	276	316
3 Average annual income per rural labour household (Rs) ²	5440	6184
4 (1) as percentage of (3)	26	26
5 Per capita annual consumer expenditure of rural households (Rs) ³		
6 (2) as percentage of (5)	1327	NA
7 Per capita net domestic product (Rs) ⁴	21	-
8 (2) as percentage of (7)	1963	2397
	14	13

Notes: (a) As per the NSS 38th round the family size of rural labour household was 5.05.

(b) For 1983-84 the annual income is obtained from GOK (1985) and for 1986-87 this income has been inflated by the CPI AL.

(c) This is obtained from NSS 38th round.

(d) GOK *Economic Review* relevant years.

the SNP is implemented, reported that the incidence of moderate and severe malnutrition in the state is 47 and 10 per cent respectively, the lowest among the states in the country.

The programme for feeding school-going children in classes I to IV (and in class V if it is attached to the primary school) has a longer history than supplementary nutrition and health care to pre-school children. Although this programme existed selectively in the former state of Travancore-Cochin, on a Kerala-wide scale it was started in 1961, i.e., more than three decades ago. The full commodity support for the programme came from a voluntary relief organisation, Cooperation for American Relief Everywhere (CARE) till the end of the 1970s and partially till the mid-1980s, when it stopped the support. The programme continued with the support and financial assistance of the state government. The objective is to provide approximately 410 calories and 15 gm of protein, which would account for one-fourth of the normal daily requirement of a child. It is need-oriented in the sense that only those who wish to take part are served the meals, during lunch time, in the schools. The government makes available the commodities for the programme and some money for meeting expenses for cooking fuel, etc. During times of delay or financial stringency, the latter amount is raised by the parent-teacher associations which have been formed in almost all schools in Kerala. A part-time person is employed for cooking/cleaning, etc., and the food is served by the teachers as part of their duty. As a proportion of the school-going children in this age group, the children who benefited under this scheme works out to 70 per cent, which has registered a sharp decline to around 50 per cent in 1990-91 (see Table 16). The stress on the programme due to demographic factors has practically ceased since the 1980s.

VI An Assessment

Given the slow rate of growth of the Kerala economy since the mid-1970s, the 'trickle down' theory cannot explain the decline in the incidence of poverty in rural Kerala. Our explanation of the decline in incidence in the 1980s is in terms of the expansion in the directed state intervention programmes since the early 1980s. To get an idea of the impact of these programmes, we have worked out the money equivalent of the benefits for 1983-84 and 1986-87, presented in Tables 17 and 18. The details of the calculations are given in the Appendix. Since much of the rural poverty is accounted for by rural labour households, we have worked out the benefits on a per rural labour household basis. Table 18 presents these benefits in terms of rural labour household income, consumption and per capita state

Appendix ESTIMATES OF SIZE OF RURAL LABOUR HOUSEHOLDS AND PER HOUSEHOLD INCOME TRANSFER THROUGH VARIOUS POVERTY ALLEVIATION PROGRAMMES

Year	Total Popn	Rural Popn	Family Size	Rural hhs	Rural Labour hhs	Agriculture Labour
1	2	3	4	5	6	7
1974-75						
Percentages	100	81		100	42.18	27.41
In lakhs	234	190	(6.0)	32.00	13.50	8.7
1983-84						
Percentages	100	81		100	49.61	27.0
In lakhs	270		(5.7)	37.80	18.75	10.2
1986-87						
Percentages	100	75		100	49.61	27.0
In lakhs	283	21	(5.7)	32.26	18.48	10.0

Notes. These estimates of the number of rural labour households are not precise because of paucity of firm data for the years selected here. However, they do reflect here approximate orders of magnitude and are unlikely to err more than plus or minus 5 per cent.

Total population and the rural population are based on the census figures. The share of rural population for 1974-75 and 1983-84 are taken from the 1971 and 1981 Census figures. For 1986-87, the share of rural population has been taken at 75 per cent since the 1981 figures show a share of 74 per cent. The figures on family size are for the whole population and are also from the census reports; however the reports of the labour enquiry surveys show a slightly lower family size for rural labour households. The share of rural labour households out of the total rural households is obtained from the rural labour enquiry reports for 1974-75 and 1983-84, and the figures for the latter have been applied for the 1986-87. These estimates of the number of rural households have been used to calculate the household transfer of income through the various poverty alleviation measures. The details are given below.

Public distribution system. It was found that nearly two-thirds of the total purchase of rice per week per household by the poor households come from the public distribution system [George 1979 and NSS 42nd Round]. The implicit income gain has been taken as the difference between the PDS and open market price of rice. In 1983-84 these were Rs 2.40 and Rs 4.43 per kg respectively. The income gain was therefore Rs 624 per household. Similarly in 1986-87 the prices were Rs 2.74 and Rs 4.24 per kg respectively and the income gain was Rs. 468.

School meal programme. Here we take only the minimum cost incurred in providing the meal at 410 calories and 15 grams of protein per child for 180 days. The equivalent of calories in terms of rice would be around 83 grams. The minimum cost of rice and pulses plus the cost of fuel would be around one rupee in 1983-84, and we have taken the same for 1986-87 since the retail price of rice declined slightly but the price of pulses and fuel increased.

Pension to destitutes. Here it is assumed that the amount distributed on this account is an implicit income transfer to rural labour households because in the absence of this income transfer the burden of maintaining the destitutes would have fallen on them. The share of destitutes is taken as the percentage of the rural population. In 1983-84 this came to Rs 82 lakh (81 per cent of Rs 1,018 lakh) spread over 18.75 lakh rural labour households. This worked out to Rs 44 per household. In 1986-87 this was Rs 57 per household.

Old age pension to agricultural labourers: Agricultural labour households are subsidised under rural labour households. In 1983-84 the per household income transfer worked out to Rs 60 and in 1986-87, Rs 89.

Supplementary nutrition programme: The number of beneficiaries for SNP taken here is for 1984-85 due to non-availability of data for 1983-84. At the rate of one rupee per child for 30 days would be reckoned at Rs 1,907.55 for rural children, which worked out to Rs 102 per labour household in 1983-84. For 1986-87 this was Rs 100 per household (75 per cent of Rs 2,466 lakh spread over 18.48 lakh rural labour households).

IRDP: While working out the income transfer under this head, we do not assume that the income was for consumption purposes. This is indented as investment in self-employment to generate income. However our intention is to work out the total income transfer to poorer households under various programmes. In 1983-84 this was Rs 215; however 25 per cent of this has been deducted for leakages, etc., coming down to Rs 161 per household. Similarly in 1986-87 this worked out to Rs 252.

NREP: There are two components here. The money expenditure works out to Rs 172 per household after deducting for leakages, etc., for 1984-85 (this year is taken due to incompleteness of data). Similarly, the foodgrain component has been valued at the retail price of Rs 4.43 per kg. This works out (after deducting 25 per cent for leakages, etc.) to Rs 74 per household. Together the income transfer works out to Rs 246 in 1984-85 and Rs 410 in 1986-87.

Other benefits: There are a number of specific programmes, though smaller in scale, aimed at the poor. We have taken here only three important items, viz., unemployment assistance (which is intended for the unemployed registered in the employment exchange for a specified period of time), scholarships for students belonging to scheduled castes and tribes, and expenses of the Kerala State Scheduled Castes and Scheduled Tribes Development Corporation on various programmes. This should therefore be considered as an estimation of the transfer payment under this miscellaneous category. For unemployment assistance the share of rural areas is taken as 81 per cent for 1983-84 and 75 per cent for 1986-87. Of this the share of the rural labour households is taken as 49.61 per cent. For the other two items, the share of the rural areas is taken as above and the entire amount assumed to accrue to the rural labour households.

net domestic product. By 1983-84 the income effect of the various programmes was 26 per cent of the annual income of the rural labour household. This was 21 per cent in terms of household consumer expenditure. Given a family size of 5.05 per rural labour household, this has meant that the income effect was equal to the consumption of one member of the rural labour household. The picture is more or less the same in 1986-87 as well. Given the fact that the poor usually belong to those households that are constrained by unemployment as well as instability in employment, lack of education and access to better employment opportunities, social barriers, etc., the state intervention programmes have indeed contributed to the decline in chronic poverty. This however does not mean that vulnerability to poverty has ceased among those who have crossed the poverty line. As we have discussed in Section II, an alternative measure of poverty using the price index relevant to the middle range population gives an estimate which is twice that given by the estimate using the consumer price index for agricultural labourers. Therefore the price factor is an important determinant of the incidence of poverty.

This brings us to the crucial role of the public distribution system in meeting the foodgrain requirements of the poor. The recent change in economic policy is also a cause for alarm as far as poverty reduction is concerned. The withdrawal of the subsidy on foodgrains distributed through the PDS means that the implicit income effect to the poor will now be much less. This is a crucial factor determining the level of poverty. While there is a case for removing the subsidy for those who can afford to pay a higher price,

it is important that this subsidy is retained for all those vulnerable to poverty if poverty alleviation is to be retained as a national objective. In the Kerala context, nearly half the households could be deemed as vulnerable, deserving subsidy for commodities distributed through the PDS.

From the point of view of poorer households, the PDS is crucial in view of the fact that basic commodities are directly distributed. This is in contrast to any other alternative programme in which money transfer is effected which might not be translated into actual consumption of basic necessities by members of the household. In the Kerala context, it is important to note that the PDS is spatially well distributed and that poorer households can buy rations on a weekly (or even part of week) basis, depending on their purchasing power. Instead of subjecting such crucial social protection programmes as the PDS and the SNP to any scheme of cutting subsidies in the name of economic liberalisation, the attempt should be to improve their functioning and enhancement of benefits to the poor. Such a focus is compatible with the need for

human resource development, which will show up in the quality of the labour force in the long run.

The experience of Kerala in relation to poverty alleviation also throws up two important issues of growth with social justice. The first is that, with or without growth, it is possible to alleviate poverty by well designed and implemented programmes. Here it is important to target the most vulnerable among the poor. These are the destitutes, pregnant women, children and old age persons. The programmes that we have examined here would be valid even in a context of growth because these sections deserve special attention due to the fact that their capabilities are less than those who are in the labour force. What is needed in the Kerala context is strengthening of these programmes to give substantial assistance to the beneficiaries. However this warrants higher rates of growth so that these programmes can be enhanced and sustained. Moreover, from the point of view of those who are in the labour force, there is need for much higher rates of growth. In the Kerala context, those who have work, whether in the organised or unorganised sector, have proved their ability to secure higher wages, but the continuing constraint is that of high levels of unemployment. Therefore a pattern of growth which could generate adequate employment to the rural poor would not only alleviate but eliminate the problem of absolute poverty in a state like Kerala. This is unlike many other states where rural labourers will not be able to come out of their poverty by enhanced employment alone, their wage rates have also to be enhanced.

If there is a lesson in the Kerala experience in terms of poverty alleviation, it is this: that social protection expressed in terms of meeting the basic consumption requirements of the poor, especially those vulnerable among the poor, should be a necessary component of development policy. However this is not a sufficient condition. For that, there should be a growth strategy which would provide adequate employment to all those who are in the labour force from the poorer sections of the population.

Notes

[This paper is part of an all-India research project on poverty alleviation and its management in India co-ordinated by V S Vyas, Institute of Development Studies, Jaipur. This version of the paper was presented in a workshop at the IDS, Jaipur on February 12, 1993 and was also given as a seminar at the Centre of Asian Studies Amsterdam (CASA) of the Amsterdam School of Social Research, University of Amsterdam on April 15, 1993. The author is grateful to the participants of the workshop as well as of the seminar for their comments and suggestions. A special word of thanks is due to Saikat Sinha Ray and Georji Thomas for their able assistance in research and data processing, respectively.]

1 See Dandekar and Rath (1971). Although the measurement of poverty in India in terms of per capita consumption expenditure is supposed to take into account non-food requirements, they do not in any way give us an idea of human capabilities resulting in certain functionings (e.g. being educated and healthy). This nevertheless has been recognised as an important dimension. At the international level, the measurement of the Human Development Index (HDI) by the UNDP and the emphasis on human resources development by such agencies as the World Bank is reflective of this recognition. Interestingly, in the Kerala context this broader dimension of poverty was recognised in the early 1970s. While re-examining the existence of mass poverty in India based on calorie requirement, a study undertaken by the Centre for Development Studies sought to broaden the horizons of poverty studies by examining the impact of state intervention in the distribution of food and creation of employment and redistribution of assets on the one hand, and the effect of providing education and health to the poorer segments in society, on the other (CDS/UN 1975). Nowhere else in India can the human development dimension be better illustrated than in Kerala because of its spectacular achievements in the face of continuing economic constraints. A study [Shivakumar 1991] on measurement of HDI for the Indian states places Kerala at the middle range (>0.5) along with Punjab, Haryana and Maharashtra. As we can see from Table 2, the achievements in social development indicators is in sharp contrast to that of the per capita GDP. Although the latter is an underestimation because of the exclusion of remittance income, growth in per capita income is by no means impressive in Kerala.

2 The first comprehensive study highlighting the importance of public policy in advancing social development and establishing food security in Kerala was by the Centre for Development Studies (CDS/UN 1975). Subsequently a number of detailed studies have been carried out on specific areas. See for example Nair (1981), Panikar and Soman (1984), Kannan, et al (1991).

3 Kakwani and Subbarao defined ultrapoor as those with 80 per cent or less of the monthly per capita expenditure of Rs 50 defined by the Planning Commission as the poverty line for rural India at 1973-74 prices.

4 The much criticised estimates of the Planning Commission showed that the decline in rural households below the poverty line between 1977-78 and 1987-88 was from 47.4 to 16.4 per cent, the fastest among all the states in India. The criticism was mainly of the methodology used. Planning Commission estimates were used for an inter-state comparison of the decline in rural poverty since the ranking is unlikely to be affected [see Vyas and Vidya Sagar 1994].

5 Recent evidence shows a decline in the share of operational holdings among the poor. Analysis of the 26th and 37th rounds of the NSS on ownership and operational holdings of land in India between 1971-72 and 1981-82 found that the incidence of tenancy has indeed come down to a significant extent in Kerala, both in terms of households and area. At the same time the bottom 40 per cent of

the rural population experienced a decline in their already meagre share of ownership holding but there was a significant increase in the case of the top 20 per cent from 69.6 per cent to 77.16 per cent of the total ownership holdings. This has resulted in an increased skewness of the distribution of ownership holdings between 1971 and 1981 [Nair et al 1991].

6 While the population growth rate has been brought down to an appreciable extent Kerala remains one of the most densely populated states in India. In 1901 the population per sq km in Kerala was 165 as against 77 for all India. In 1991 these figures were 747 and 767 respectively.

7 The marketing of the products produced by IRDP households emerged as a real bottleneck and the government formed in 1989-90 an organisation called Kerala Rural Development and Marketing Society (KERAMS). Their main objective has been to organise the sale of the products of IRDP beneficiaries as well as rural artisans, women's organisations and voluntary organisations. A modest beginning seems to have been made with sale proceeds of Rs 6.5 lakh in 1989-90 rising to more than Rs 15 lakh in 1991-92.

8 The total quantity of rice and wheat distributed by the Kerala State Civil Supplies Corporation during the five years 1981-85 was around 4,20,000 tonnes, which was a mere 6 per cent of that distributed through the ration shops for the period.

Alleviating Poverty

Maharashtra Employment Guarantee Scheme

S Mahendra Dev

In spite of the limitations in its design and implementation the EGS has made positive impact on the levels of living of the rural poor in Maharashtra. However, the EGS alone cannot remove the poverty in rural areas of the state. And any replication of the scheme in other states should involve prior establishment of decentralised district planning and implementing body, and assurance of adequate funds through additional taxation.

I Introduction

INDIA is one of the few countries in the world where all kinds of anti-poverty programmes have been tried out. Apart from the central government sponsored schemes, state governments have tried various types of poverty alleviation programmes. The state of Maharashtra also implemented some of these schemes. However, what distinguishes Maharashtra from other states for a case study is the novelty of its main wage employment programme namely the Employment Guarantee Scheme (EGS), which was introduced in the early 1970s.

Before going to the organisation of the paper, a few words about Maharashtra and objectives of the present study are in order. In terms of population and geographical area, Maharashtra is the third largest state in India. The state had the second highest per capita State Domestic Product (SDP) among all the Indian states in the year 1990-91. The high per capita SDP however hides enormous urban-rural contrasts¹ and regional disparities.²

The relative prosperity of the state also hides a great deal of rural poverty. In a state where more than 65 per cent of the total labour force depend on the agricultural sector, it is obvious that the levels of living of the substantial proportion of the state's population depend on the performance of agriculture. Moreover, agriculture productivity in the state is very low because of low rainfall and low irrigation facilities.³ Droughts occur repeatedly in the state, the recent one being the drought of 1991-92. Because of low productive and uncertain agriculture there has been acute seasonal and disguised unemployment for a majority of small and marginal farmers and agricultural labourers.

Since its formation in 1959, the government of Maharashtra has been trying to contain rural poverty through several programmes. The approach of the state towards poverty alleviation seems to be in two forms, viz. general productivity raising programmes in agriculture and direct anti-poverty programmes with emphasis on wage

employment. Due to the problem of water resource scarcity, the state introduced watershed development programmes which also helped small and marginal farmers. Also there have been some efforts by local leaders to develop villages based on water management through peoples' participation. Among the direct anti-poverty programmes, EGS is of course the most important one. As shown by Dreze (1990b) the public works programmes helped in preventing the famine during the drought of 1970-73 in spite of the low and declining per capita availability of foodgrains in the state. During the drought period the EGS was used as a relief programme. "By any criterion the drought of 1970-73 in Maharashtra must have marked an all time record for the scale and reach of public works programmes in a famine relief operation" [Dreze 1990b:89]. After the drought period the government has continued the EGS and used it as an anti-poverty programme.

The main objective of this paper is to present an overview of the state's strategy in terms of anti-poverty programmes and more importantly to critically review the EGS. Using the micro-studies and secondary data, the present study evaluates a number of issues relating to the EGS of Maharashtra based on the following questions. (1) What is the impact of the scheme on employment and poverty? (2) What are the indirect effects of the scheme? (3) What is the impact of the scheme on women? (4) How are the delivery and recipient systems? (5) How is the performance of the EGS as compared to other anti-poverty programmes? and (6) What are the lessons from the EGS for replicating it in other states?

Before going to the poverty alleviation programmes, the article presents a detailed profile of Maharashtra's economy relating to the rainfall distribution, economic growth, demographic factors and employment, institutional aspects, etc. in Section II. This section also includes trends in poverty and characteristics of the poor. Section III gives an overview of the poverty alleviation programmes in the state's strategy. While Section IV concentrates on the EGS, last section provides concluding remarks.

II Profile of Economic, Demographic and Institutional Aspects

In order to provide a proper perspective regarding the macro environment with which the agricultural sector has to function, rainfall distribution in the state can be first brought to begin with.

Rainfall Distribution and Drought Prone Areas: There is wide rainfall disparity amongst the different parts of the state. Heavy rains occur in Konkan region where annual average rainfall goes up to 2,000 mm. However, about 40 per cent of the total area receives rainfall less than 700 mm per year, and in some areas even less than 500 mm. About a third of the state is drought prone. About a fourth of the total area receives rainfall ranging from 700 to 1,200 mm per year. The report of the Fact Finding Committee for Survey of Scarcity Areas in Maharashtra State (1973) has identified 12 districts, namely, Ahmednagar, Solapur, Pune, Nashik, Sangli, Satara, Aurangabad, Beed, Osmanabad, Dhule, Jalgaon and Buldhana as drought prone districts. Thus these districts are chronically prone to the vicissitudes of rainfall and consequent instability in agriculture [PEO 1980]. These 12 drought prone districts together account for about 60 per cent of the state's net sown area which highlights that bulk of the state's cultivated area is located in drought prone area districts.

State Domestic Product As mentioned above, there are enormous disparities between rural and urban areas. The urban-rural differences will be clear if we look at State Domestic Product (SDP) by sectors. The per capita SDP and the per worker value added in manufacturing in the state were nearly 42 per cent and 32 per cent higher than the national average respectively for the year 1988-89. However, per hectare average value added in agriculture and per worker agricultural SDP were 40 per cent and 26 per cent lower than all Indian average respectively in 1988-89.⁴ In the same year, Maharashtra's rank in terms of SDP originating from agriculture in descending order was 10th out of 13 states whereas it had first rank in terms of per

capita SDP for manufacturing and services [CMIE 1991]. Also, a major portion of the manufacturing and tertiary sectors in the state is concentrated in the Bombay-Thane-Pune belt.

The macro-economic performance of the state in different periods is given in Table 1. Performance of agriculture and allied activities (primary sector) was not satisfactory during the 1960s. In fact, it recorded a negative growth during the period 1960-61 to 69-70. As a result, the SDP also recorded only 2.85 per cent growth. The growth of primary sector picked up during the 1970s and recorded more than 6 per cent growth. The SDP growth during this period was more than 5 per cent. In the 1980s again the growth of primary sector declined to 1.67 per cent. The performance of agriculture sector thus showed fluctuations during the last three decades. On the other hand, the growth rates of secondary and tertiary sectors were satisfactory. Particularly in the 80s the growth rate of service sector was more than 6 per cent.

Sectoral Distribution of SDP and Workforce: The share of agriculture in the total SDP declined considerably over time due to its slow growth compared to other sectors. From around 42 per cent in 1960-61 the share came to less than 25 per cent in 1988-89. The economy, however, still continues to be predominantly agrarian as far as the disposition of the work force is concerned. The NSS data show that the share of agricultural workers was around 85.6 per cent and 67.1 per cent respectively in rural workforce and total workforce (rural + urban) respectively in 1983. The standard of living of majority of the population in the state is thus dependent on the performance of agriculture.

Demographic Factors and Employment: The total population of the state as per 1991 census was 78.8 million. The population growth during the decade 1981-91 was 2.29 per cent per annum which was slightly higher than that of all India. The urban component of the state was about 38.7 per cent in 1991 which was much higher than all India. Maharashtra has the highest percentage of urban population to total urban population in India. Greater Bombay is the mega city with 12 million population or 41 per cent of the urban population of the state. Urban population is predominantly concentrated in Bombay, Pune and Nagpur areas. During the decade 1981-91, urban growth in Maharashtra was 3.27 per annum which was higher than that of all India.

According to the 1981 census there were about 47 lakh immigrants (by place of birth) and 15 lakh outmigrants. Thus the net migrants were around 32 lakhs. More than 50 per cent of the total immigrants had immigrated to Bombay only. As against 10 lakh immigrants in the decade 1961-71, the

number of immigrants during 1971-81 decade increased to 19 lakhs in the state. Of the total urban migrants nearly 50 per cent were from the rural areas of Maharashtra. Rural to rural migration is also important in the state.

Trends in Employment and Unemployment: The work force participation rates for rural Maharashtra did not show discernible trend as such during the period 1972-73 to 1983.¹ The participation rate for females in rural Maharashtra which was around 54 per cent was the second highest (next to Rajasthan) in the country in 1983.² The corresponding figure for all India was only 39 per cent. The difference between the participation rates of principal and total (principal and subsidiary) activities was also less for Maharashtra as compared to that of all India.

The person day unemployment rates are given in Table 2. The incidence of unemployment for Maharashtra declined significantly over time for both males and females. Particularly between 1983 and 1987-88, the incidence declined from 6.25 to 2.9 per cent for males and 7.2 to 3.5 per cent for females. In 1987-88, the unemployment rates for Maharashtra were lower than those of all India. The decline in the incidence of unemployment over time could be due to labour absorption in agriculture and the EGS. Bhalla's study (1987) showed that labour absorption in agriculture during the period 1970-71 to 1983-84 was quite high in Maharashtra. Subbarao (1992) indicated that the EGS could be responsible for the decline in unemployment rate particularly for females in 1983.

Political Organisation of Poor: In Maharashtra, organisation of the poor has been notable mainly in the tribal areas even during the pre-independence period. Mobilisation of tribals in some form exist in Thane, Chandrapur, Dhule and Nashik districts. Kisan Sabha was the pioneering organisation for Thane district. Recently, Bhoomi Sena has taken up the cause of the poor people in Thane district. Another organisation namely Shramik Sangathan has been active in mobilising the poor in Dhule district. In the non-tribal areas the mobilisation of the poor labour or poor people has been quite weak. Due to this organisations of the landless agricultural labourers, small and marginal farmers have not emerged in Maharashtra to a significant extent [Brahme and Upadhyay 1979]. One study comments that the history of political mobilisation in the state is a reflection of the history of reassertion of 'Maratha' hegemony [Lele 1990].

¹Based on various indicators, the report of the Fact Finding Committee on Regional Imbalances in Maharashtra [GOM 1984] showed that Vidarbha, Marathwada regions

were backward compared to western Maharashtra. According to some reports, the absence of strong and cohesive political leadership in Vidarbha and Marathwada could be the main reason for the continued neglect of these regions by the state (*The Economics Times*, November 26, 1991). On the other hand, western Maharashtra could develop due to the political clout of leaders like Y B Chavan, and Vasantdada Patil. Under the umbrella of the co-operative sugar factories, the political leaders in this region could consolidate their position over time. This also has something to do with 'Maratha' hegemony.

Access to Land: It is well known that one of the most important assets in rural area is agricultural land. In Maharashtra, as in other states, poverty of the households is inversely related to the size of land holding. The trends in the structure of operational holdings are given in Table 3. It shows that the shares of marginal (up to 1 ha), small (1-2 ha) and semi-medium (2 to 4 ha) size classes have been increasing in terms of both number of holdings and operated area. It should, however, be noted that marginal, small and semi-medium classes together with a share of around 80 per cent in the total number of holdings accounted for only 46 per cent of the operated area in 1985-86.

Some other indicators on land holding for the year 1981-82 showed that the average size of holding was around three hectare in Maharashtra which was much higher than that of all India. The average size of holding is overstated because the land is not adjusted for soil quality. The quality of soil in the state is relatively low [Bhalla 1988]. The percentage of land under tenancy and average number of parcels were lower in Maharashtra as compared to all India. However, the percentage of landless households in Maharashtra is one of the highest in India (around 21 per cent). On the basis of access to land criterion Maharashtra seems to be poorer than many other states.

Regarding inequalities, the Gini Coefficient of ownership holdings was 0.62 in 1972 and 0.628 in 1982. However, in value terms, the Gini-Coefficient was low at 0.591 in 1971 and also declined to 0.574 in 1981. The inequalities in non-land assets such as buildings, livestock, agricultural machinery are, however, lower than that of land [Bhalla 1987].

The ceilings on agricultural holdings were first imposed on January 26, 1962. The ceilings then prescribed were lowered from October 2, 1975. By the end of March 1990, 2.86 lakh hectares of land was declared surplus. Tenancy laws came into force in Maharashtra between 1957 and 1965. Tenancy in the state came down from an estimated 30-35 per cent in the 1940s to

is than 5 per cent in the 1970s [Reddy 85]. The programme of consolidation of holdings is being carried out under the provisions of the Bombay Prevention of Fragmentation and Consolidation of Holdings Act, 1947. Implementation of land ceiling legislation is somewhat better than that of ceiling legislation at any rate. Also, cultivable areas have either been consolidated in the process of being consolidated (Antwala 1985a).

Access to Water: One of the major factors accounting for instability in crop production, in addition to the vulnerability of rainfall, is the very low percentage of gross cropped area under irrigation (12 per cent even in 1990-91). The Maharashtra State Irrigation Commission [GOM 1962] estimated that it would be possible to create irrigation potential of 70.61 lakh hectares from the cultivable surplus as well as groundwater sources, out of which 52.61 lakh hectares could be through surface water and 18 lakh hectares through groundwater resource. The ultimate irrigation potential thus works out to hardly 35 per cent of the cultivable area in the state. There are significant inter-regional and inter-crop variations in the availability of water. In western Maharashtra and eastern regions, the percentage of area irrigated varied from 16 to 23 whereas in Konkan, Vidarbha and Marathwada, irrigation is less than 10 per cent in 1988. Despite the importance of water, more than 60 to 70 per cent of water in the state is used only for one crop, namely, sugarcane. This crop is planted in 3 to 4 per cent of total cultivated land owned by less than 10 per cent of landowners. All other important crops in Maharashtra's economy—cotton, oilseeds, pulses—are denied a fair share in irrigation water [Shinde 1988]. A study by Rath and Mitra (1986) calculates that based on the present pattern of cropping under irrigation, no more than 34 per cent of the cultivated land in the state is likely to be irrigated. A changed pattern of cropping away from sugarcane to low water-intensive crops can increase this to more than 50 per cent of the cultivated area.

Consumption Based Poverty: Accessibility of poor population to land and water has already been discussed above. We take up the income or consumption based poverty from other aspects such as accessibility of water to public distribution system, health, education, etc.

In the absence of income data, poverty estimates are generally made on the basis of NSS consumption data. Estimates of poverty, made using a poverty line of Rs 15 in all India and Rs 16 for Maharashtra at 1950-61 prices (and updated by using consumer price index numbers for agricultural labourers) do not show any consistent trend [Table 4]. They show a pattern of fluctuations up to 1977-78 but

in the later years, i.e., in the 1980s, there seems to be a declining trend for Maharashtra. The decline seems to be very significant between 1977-78 and 1983. Kakwani and Subbarao (1990) attributed this to the impact of the EGS. The year 1986-87 was a bad one in terms of rainfall. The foodgrains production declined from 87.8 lakh tonnes in 1985-86 to 71.4 lakh tonnes in 1986-87. The marginal decline in poverty between 1983 and 1986-87 could be attributed to the poor agricultural performance. The decline was more prominent between 1983 and 1987-88.

The incidence of poverty (head count ratio as well as Sen index), however, was higher than that of all India in most of the years during the period 1959-60 to 1987-88. The studies by Minhas et al (1991) and Kakwani and Subbarao (1990) using different poverty lines showed that poverty levels in rural Maharashtra were higher than that of all India. According to the study by Minhas et al (1991), the incidence of rural poverty was around 54 per cent in 1987-88 and this percentage was lower than those of only in three other states namely Bihar, Orissa and West Bengal. Urban poverty which was around 36 per cent in 1987-88, however, was much lower than those of many other states. This study showed that the absolute poor of rural Maharashtra increased from 19.4 million in 1970-71 to 24 million in 1987-88 while that of urban poor increased from 6.3 million to 8.7 million during the same period.

The trends in the incidence of poverty are determined by several factors such as performance of agriculture, changes in inequality, changes in consumer prices, etc. The inequality in consumption distribution for rural Maharashtra does not seem to have worsened [Dev et al 1991]. Even the increase in consumer price index numbers was more or less similar to that of all India. Regarding agricultural performance, Ahluwalia's study (1978) showed that there was significant negative relationship between incidence of poverty and per capita agriculture production for Maharashtra during the period 1959-60 to 1973-74.

The data for estimating poverty ratios at the regional level are not readily available after 1972-73. The estimates computed from NSS data for 1972-73 show that the inland western recorded the lowest incidence of poverty whereas inland eastern recorded the highest incidence. The Fact Finding Committee on Regional Imbalances [GOM 1984] based on a comparison of monthly per capita consumer expenditure for the years 1963-64, 1971-72 and 1977-78 reveals that the performance of coastal and inland western regions in terms of per capita expenditure has improved while those of Vidarbha and Marathwada declined as compared to the state average.

Characteristics of the Poor: A shortcoming of the poverty measures based on NSS data is that no allowance is made for random or transitory variation in consumption. For instance, some households may slip temporarily into or out of poverty with sudden changes in the price of a major agricultural commodity or in the weather. Gaiha and Deolalikar (1991), using nine years of panel data on 170 rural households in 4 villages of Maharashtra and 2 villages of Andhra Pradesh for the period 1975-84, presented alternative estimates of poverty. The estimates show that slightly more than 60 per cent of the poor households were poor roughly half the time (i.e., during five

TABLE 1: GROWTH IN STATE DOMESTIC PRODUCT BY SECTORS (per cent per annum)

Sector	1960/61 to 1969/70	1970/71 to 1979/80	1980/81 to 1989/90
Primary sector	-0.86	6.25	1.67
Secondary sector	5.23	5.60	5.49
Tertiary sector	4.12	4.93	6.48
Total SDP	2.85	5.60	4.94
Per capita SDP	0.43	3.33	3.02

Note: Growth rates are estimated by using semi-log trend function.

Total	100.0	100.0	100.0	100.0	100.0	100.0

Source: Reports of the Agriculture census 1970-71, 1980-81 and 1985-86, Government of Maharashtra.

of the nine sample years) and 21.8 per cent of the poor households were poor during all nine years. Thus, the persistently poor are only a fifth of the total poor households.

Separating the 'persistent poor' from the 'transient poor' is important since the policies needed to combat the two types of poverty are quite different. For example, while rural works programmes or relief operations may be helpful in alleviating transient poverty, they may not be sufficient to address the problem of persistent poverty. Systematic asset or income transfers may be needed to alleviate the latter.

It is well known that poverty levels vary across different sections of the population in rural areas. In order to bring into focus these variations in poverty levels, the incidence of poverty is analysed by broad categories of households differentiated by reference to principal means of livelihood. The 32nd and 38th rounds of NSS on employment and unemployment distinguish the following household types: self-employed in agriculture and non-agriculture, agricultural labourers, other labourers and other labour households. Using the procedure mentioned earlier, head count ratios for each of these households in Maharashtra and all India for the years 1977-78 and 1983 were estimated.

The estimates presented in Table 5 show that the incidence of poverty in Maharashtra declined significantly for all types of households between 1977-78 and 1983. In spite of the decline, the incidence of poverty for agricultural labour households was around 53 per cent in 1983. Their share in total poor households was the highest, around 54 per cent in 1983. As compared to all India, the share of self-employed in agriculture among the total poor was lower whereas that of agricultural labourers was higher for Maharashtra in 1983 (Table 5).

The share of rural areas in PDS total purchases in Maharashtra was between 56 to 62 per cent for rice, wheat, sugar, edible oils whereas that of kerosene it was only 26 per cent in the year 1986-87 [Government of India 1990]. Compared to rural India's share of 55 per cent for kerosene rural Maharashtra's share was much lower. The accessibility of the poor in rural Maharashtra to PDS was much better than many northern and eastern states although it was lower than the neighbouring state of Gujarat [Dev and Suryanarayana 1991].

A recent study [Kumar 1991] on Human Development Index (HDI) puts four states, namely, Haryana, Maharashtra, Punjab and Kerala under medium HDI category while rest of the states fall under low HDI category. Three indicators viz, life expectancy at birth, adult literacy and per capita GDP are used for estimating HDI of major states in India. According to this

study, Maharashtra's HDI for the year 1981 was 0.532 whereas that of India was 0.439. Another study [Vyas and Vidyasagar 1992] constructs HDI for major states in 1987-88 using life expectancy at birth, average per capita income from agriculture and allied activities and rural literacy rates. Maharashtra's HDI was very low at 0.16. Only the HDI of Uttar Pradesh at 0.09 was lower than Maharashtra. The difference between these studies could be due to the differences in the use of state domestic product (SDP). Kumar (1991) used SDP covering both rural and urban areas whereas Vyas and Vidyasagar (1992) utilised only SDP originating from agriculture. From the point of view of rural poverty, there is some merit in taking the SDP from agriculture but well developed urban sector may also help the development of rural areas as will be shown later in the case of EGS.

It may be noted, however, that if one looks at the basic data relating to health and education, rural Maharashtra does not lag behind many of the states in India. These indicators which relate to rural areas (except in the case of life expectancy and couple protection rates) are presented for Maharashtra, all India and the neighbouring state of Gujarat in Table 6. The table shows that in most of the indicators of health and education Maharashtra is better placed than all India and in some indicators better than Gujarat.

III Overview of the Anti-Poverty Programmes

As mentioned in Section I, the approach of Maharashtra government towards poverty alleviation seems to be in two forms, viz,

general productivity raising programme agriculture and direct anti-poverty programmes with emphasis on employment. For example, the Sixth Plan recognising state's problem of water resource scarcity introduced a large number of programmes to improve the productivity: dry farming, especially that of small marginal farmers through means of water and soil conservation, increase of vegetal cover and similar programmes on watershed basis. Also, a substantial emphasis was given to increase employment in the state. A provision is also made tribal sub-plan to help the tribal population of the state.

This section provides an overview of direct anti-poverty programmes: programmes related to land and water management. Before going to these aspects the government expenditure for various activities in the state is examined.

A substantial portion of the budgetary expenditure is incurred on development services. The proportion of development expenditure increased from 61 per cent in 1961-62 to 64.9 per cent in 1975-76 to around 70 per cent in 1989-90. The main item of expenditure on revenue account education. The other development services that claim substantial expenditures: agriculture and allied activities, followed by energy, irrigation, health and family welfare. Out of the budgeted capex expenditure outside the revenue account around 91 per cent is on economic services. Mostly it is on irrigation, transport, agriculture and allied activities.

The percentage of plan expenditure the total expenditure increased from 2 per cent in 1975-76 to 27.7 per cent in 1989-90. The plan expenditure on differ-

activities and their shares in the total for the year 1985-86 are given in Table 7. It shows that the share of agriculture and allied activities which included special programmes on rural development was about 28 per cent of the total whereas the share of social and community services was around 23 per cent. Another major share belonged to water and power development (36 per cent). In the year 1985-86 the share of expenditure on EGS was around 14 per cent.

DIRECT ANTI-POVERTY PROGRAMMES

The Maharashtra government gave top priority to employment generation schemes. From time to time schemes on short term basis to deal with the situation of particular severity and on regular basis were taken up. Some of the schemes operated in the 1970s were scarcity relief programme (1970-73), crash scheme for rural employment (1971-74), village employment schemes (1972-73), food for work programmes (1974) [GOI 1980]. The most important poverty alleviation programme (PAP) in the state is of course the Employment Guarantee Scheme (EGS) which has been continuing since the early 1970s.

NREP and RIEGP. For rural employment Indian government has also sponsored some programmes. The National Rural Employment Programme (NREP) and the Rural Landless Employment Guarantee Programme (RLEGP) were started from the year 1982-83 and 1983-84 respectively. The expenditure on NREP and RLEGP together was around Rs 103.5 crore and they generated 5.18 crore person days in the year 1988-89. There are however many shortcomings of these programmes [see GOI 1987 for evaluation on NREP]. The Directorate of Economics and Statistics of GOM has for 1,423 beneficiaries evaluated the RLEGP in 1987. According to this evaluation the impact of RLEGP on employment and assets in Maharashtra was very limited compared to that of the EGS.

Jawahar Rojgar Yojana. From April 1, 1989 the two programmes NREP and RLEGP were merged to form a new rural employment programme called Jawahar Rojgar Yojana (JRY). Unlike the earlier two programmes the JRY is planned and implemented mainly through village panchayats. The two rural employment programmes (JRY and EGS) together generated 17.44 crores of person days in 1990-91 of which EGS accounted for 51 per cent of the total person days generated. From the states to the districts the allocation is to be based on the index of backwardness. In Maharashtra, it was however noticed that the small panchayats are getting lower per capita than large panchayats [Godbole 1990]. Apart from this proper audit of expenditure

of village panchayats is needed if large scale leakages of funds under the JRY are to be avoided.

OTHER POVERTY ALLEVIATION PROGRAMMES

Some self employment programmes introduced in the early 1970s were programme for small/marginal farmers and landless agricultural labourers (1970-71) scheme for the benefit of artisans (1974), drought prone area programme (1974-75). Three centrally sponsored self employment based poverty programmes were introduced in the Sixth Plan. They were Integrated Rural Development Programme (IRDP), Training of Rural Youth for Self Employment (TRYSEM), Development of Women and Children in Rural Areas (DWCR). In Maharashtra TRYSEM is small and DWCR is operative in only 2 districts. Apart from the EGS only IRDP is relatively important employment programme in the state.

Integrated Rural Development Programme. The IRDP aims at making the beneficiary poor households economically viable through self employment which would enable the selected households to cross the poverty line. There are many evaluation studies on IRDP. There is however a

contrast between the findings of intensive micro studies and large scale household surveys. Micro studies on Maharashtra are not readily available. The findings of the large scale studies are much more encouraging. There are four major large scale studies on the IRDP which covered the whole country. Subbarao (1985) and Bandopadhyay (1988) have thoroughly reviewed these studies. There are many other review studies on the IRDP. Rath (1985) after reviewing many evaluation studies on the IRDP concludes that poverty alleviation programmes should concentrate on wage employment programmes rather than asset creating self employment programmes. Daniwala (1985b) on the other hand argues in favour of self employment programmes. A study by Dreze (1990a) showed the contrast between the findings of large scale and micro studies. Instead of IRDP, Dreze advocates a serious programme of employment generation, preferably in the form of an FGS with legal status.

Programmes for Drought Prone Areas. In Maharashtra 89 talukas out of the 300 talukas have been identified as chronically drought prone. During the period 1982-83 to 1987-88 the state government incurred a total expenditure of Rs 711.64 crore on

TABLE 5. INCIDENCE OF POVERTY BY HOUSEHOLD TYPE AND PERCENTAGE SHARES OF EACH HOUSEHOLD IN TOTAL RURAL POOR HOUSEHOLDS, 1977-78 AND 1983

Household Types	Maharashtra				All India			
	Incidence of Poverty		Share in Total Poor Households		Incidence of Poverty		Share in Total Poor Households	
	1977-78	1983	1977-78	1983	1977-78	1983	1977-78	1983

providing drought relief. During the same period the central assistance for drought relief was Rs 265 32 crore. In addition, the state government also incurred large expenditure on drought-proofing measures, such as watershed development, dry land farming, construction of minor irrigation works such as percolation tanks and afforestation [Godbole 1989].

Public Distribution System The government of India bears the expenditure on food subsidies in different states. The number of ration shops in Maharashtra was 35,169 in December 1990. The per capita distribution of foodgrains in the state was 22.7 kgs in 1983. This is much higher as compared to those of the poorer states like Bihar, Madhya Pradesh, Uttar Pradesh. The share of Maharashtra in total all India foodgrains distribution under PDS was 9.6 per cent in 1988-89. Based on some indicators, Tyagi (1990) estimated desired pattern of distribution. According to this estimate Maharashtra should get around 11.4 per cent of foodgrain distribution.

Social Services The per capita revenue expenditure on social services in Maharashtra increased from Rs 82.4 in 1976-77 to Rs 153.9 in 1986/87 at 1980-81 prices. During the same period, the share of social services in total spending increased from 28.3 per cent to 32.7 per cent. The government programmes and expenditure on education, health and nutrition are discussed below.

The per capita revenue expenditure on education increased from Rs 47.3 in 1976-77 to Rs 79.6 in 1986-87 at 1980-81 prices. Public expenditure on education as a percentage of net SDP at current prices has gone up from 2.71 in 1980-81 to 3.57 in 1986-87. There were 57,444 primary schools functioning in the state in the year 1990-91. Though the responsibility for primary education squarely vests in local bodies such as municipal councils and zilla parishads, a number of private institutions have opened primary schools. Average expenditure incurred by the government per pupil in 1988-89 was Rs 548 for primary schools and Rs 869 for secondary schools.

From the First to the Seventh Plan, allocation for primary education has come down from 56 per cent to 22 per cent of the total allocation for the education sector. The allocation for university education, however, has gone up from 9 per cent to 16 per cent of the total during the same period. Of the total plan and non-plan expenditure on education, while expenditure on primary education was 47.5 per cent in 1980-81 and 45.5 per cent in 1987-88, secondary education accounted for 31.1 per cent and 37 per cent respectively.

The drop out rates for the children aged 10-14 years is quite high. And, there are differences between the poor and the rich.

For example in 1980-81, the drop-out rates for bottom and top fractile groups relating to male children were 17.78 and 13.62 per cent respectively. The inequalities across fractile groups are much higher for female children. The drop-out rates for bottom and top fractile groups relating to female children were 24.58 per cent and 7.71 per cent respectively [Tendulkar 1989].

Turning to health, the real per capita revenue expenditure on health (which includes family welfare and water supply) increased from Rs 20.3 in 1976-77 to Rs 44.7 in 1986-87. These levels and growth are higher in Maharashtra as compared to all India. People in rural areas are comparatively poor. Medical experts are not willing to go to such places obviously because they are not lucrative enough. In order to solve this problem the state health ministry has planned to organise health 'shibirs' in remote areas with active participation and involvement of medical trusts and social service organisations like the Rotary and Lions clubs, members of which are professional experts.

Regarding nutrition, under the Integrated Child Development Services (ICDS) nutritious supplementary food is given to children below six years of age and to the expectant and nursing mothers. The number of such projects operating in the state in 1990-91 was 149. Of these, 131 were in rural areas and of these 131, 40 were in tribal areas.

WATER AND LAND MANAGEMENT PROGRAMMES

Realising the importance of water for the state, efforts have been made by the government and voluntary organisations to maximise the returns per unit of water. The Committee on Eight Monthly Supply of Water on the Irrigation Projects in Maharashtra made a series of recommendations for optimum use of available water resources [GOM 1979]. In the light of these recommendations the state government in February 1987 decided that in all new (small, medium and large) projects to be taken up in the future in water-scarcity basins, eight monthly irrigation system should be adopted. The committee recommended that in water scarcity basins, no additional surface water should be sanctioned to perennial crops, particularly sugarcane.

In order to expedite its long term ambitious plan, the state government has decided in May 1992, to set up a separate 'water conservation' department bifurcating some other departments, partly doing the same work, and bringing them under one roof. The new department would get budgetary allocation of nearly Rs 400 crore in 1992. Moreover, part of the funds of the EGS and the JRY would be transferred and

the department was expected to get about Rs 600 to Rs 700 crore (*The Times of India*, May 21, 1992).

Regarding the efforts of voluntary organisations, mention may be made of Pani Panchayat in Nalgonda in Pune district which succeeded in distributing limited water available in an equitable and optimum manner [Deshpande and Reddy 1990]. Many marginal farmers and agricultural labourers also benefited from these schemes. Some village level experiments in water management were successfully implemented in Ralegaon Siddhi in Ahmednagar, Adagaon and Palashed villages of Aurangabad district [Godbole 1990].

IV Evaluation of Employment Guarantee Scheme

The Employment Guarantee Scheme (EGS) is an attempt to enlarge the scope of employment in order to alleviate poverty in the state. EGS is one of the most researched wage employment programme. There have been many micro studies and studies (and comments) based on micro as well as aggregate data.¹ Using these studies and secondary data, a critical evaluation of the EGS is attempted in this section.

Begun on a very small scale in Tasgaon block of Sangli district in 1965 and extended

as part of an integrated rural development project in 1969 the scheme was adopted by the state in 1972-73 through the efforts of its architect and proponent V S Page a Gandhian leader and long-term chairman of the Maharashtra legislative council. During the drought period 1970-73 EGS was mainly in the form of relief programme [for details see Dreze (1990) Subramaniam (1975) and Osmani (1991)]. The central government also provided drought relief through Crash Scheme for Rural Employment. The Maharashtra government however was not happy with the state's dependence on the centre for drought relief. The chief minister V P Naik decided to set up a state level programme with the backing of opposition parties (using only state resources). An unprecedented feature of this programme was that of employment guarantee. The state government has given statutory support to the guarantee of employment through the enactment of the Maharashtra Employment Guarantee Act 1977 which has been brought into force from January 26 1979.

The principal aim of the EGS is to provide gainful and productive employment to the people in the rural areas and in the areas of C class municipal councils. Such applicants should be in need of work and prepared to do manual labour which they cannot find on their own. The employment has to be gainful to the individual and productive to the economy of the state.

SALENT FEATURES

The salient features of the programme are (a) All adult persons are covered under the programme. (b) The guarantee is given at the district level though operationally works are normally provided within the panchayat samiti area. The person demanding the work has no choice regarding nature of work. (c) The employment seeker has to get his name registered under this scheme with the registering authority of the village i.e. Talathi or Gramsevak by filling form no 1 prescribed under rules. Then he or she has to fill up forms no 4 and 7 [for details see GOM 1992]. Failure to provide employment creates the liability on the state for payment of unemployment allowance at the rate of Rs 2 per day. (d) Only productive works are permitted under the scheme. With a view to minimise the recurrence of drought in the state it has been prescribed that moisture conservation and water conservation works should be given priority. Accordingly priority of works is fixed as follows: (i) moisture and water conservation (ii) soil conservation and land development works (iii) afforestation (iv) road works and (v) flood protection measures. (e) The works are designed in such a way

that expenditure on labour forms at least 60 per cent of the total. (f) The wages are paid on piece rate basis. (g) Ex-gratia payment up to Rs 5,000 is admissible in case of death or disablement of a worker on the work. (h) Welfare amenities are provided to the workers such as potable water, creches, rest shade, first aid facilities etc.

From a modest beginning of only Rs 1.88 crore in 1972-73 the scheme expanded to an expenditure of Rs 235 crore in 1990-91. Its provision of employment increased from 0.45 crore person days in the first year to around 19 crores in 1985-86 but declined to around 8 to 9 crores since 1988-89 (Table 8). The cost per person day (in current prices) increased from about Rs 4 in the first year to around Rs 30 in recent years. The average wage per person day in current prices increased from Rs 3 in 1976-77 to Rs 16 in 1991-92. However if these wages are deflated by the consumer price indices for agricultural labourers the real wages (at 1970-71 prices) showed a rise from 1.75 in 1976-77 to 3.3 in 1982-83 but showed fluctuations till 1987-88. Since 1987-88 real wages have been around Rs 4 because of the rise in minimum wages.

The labour attendance varies with season. For example in 1987-88 it varied from 9.4 lakh workers in May to 2.27 lakh workers in October. Attendance is higher during lean agricultural season. The scheme has

grown to consume as much as 10 per cent of the state's developmental expenditure. The budget outlays for the EGS are higher than transportation and communication and double to that of industry and mining.

RESOURCES FOR THE EGS

This scheme is totally financed by the state government. In order to raise resources for the implementation of the scheme the state government has levied special taxes and levies: (1) Tax on professions, traders, callings and employment. (2) Additional tax on motor vehicles. (3) Additional tax on sales tax. (4) Special assessment on irrigated agricultural lands. (5) Surcharge of land revenue and (6) Tax on non-residential urban lands and buildings under Education Cess Act.

Of the total revenue raised in each of the last five years about 94 per cent was contributed by profession tax (64 per cent) and additional tax on sales tax (30 per cent). The share of tax on agricultural land is less than 5 per cent in recent years. It shows that the taxes on the EGS are mainly paid by the urban population.

The state government has to make a matching contribution equal to the net collection of taxes and levies every year. The net collection of taxes and levies and the matching contribution from the state government have to be credited to a separate

fund called 'Employment Guarantee Fund' which has been constituted to ensure that the resources raised for the implementation of the EGS are utilised only for the purpose of the EGS. If there is any balance in a particular year, the scheme is carried forward to the subsequent year.

A three tier administrative set up has been evolved to ensure close and effective liaison and continuous supervision over the programme. Committees for planning, direction, control and co-ordination have been set up at the state, district and panchayat samiti level. The works are implemented through the government departments (and not through contractors) like irrigation, public works, agriculture, forest and zilla parishads.

At the state level, the planning department is in overall charge of the programme covering all aspects of planning, administration, provision of funds, monitoring and valuation of the programme. The commissioner of the revenue division controls the EGS works in his division. The collector is in overall charge of the programme at the district level. At panchayat samiti level, the tahsildar has been assigned the functions of the assessment of demand for employment and deployment of labourers on different works in the panchayat samiti area.

The planning department makes a budget provision and releases the quarterly credit limits to the collector. The collectors have discretion to make further releases to the implementing agencies at the district level. Weekly and monthly progress reports have to be presented for the EGS. These reports are sent by the implementing agencies to the collectors for onward transmission to the planning department. Apart from the official department, there are some non-official committees for consultation and supervision of the EGS."

IMPACT OF THE EGS ON THE POOR

There has been a debate about the effectiveness of the EGS in covering the target group. Using landless labourers as the criterion for target group, the PEO study (1980) shows that only 40 per cent belonged to the target group under the EGS. Ravallion (1991), however, says that EGS is well targeted to the poor. Dandekar's study (1983) also reveals that 90 per cent of the EGS workers were below the poverty line. Employment and labour attendance under the EGS were around 19 crore person days and 6 lakhs respectively in 1986-87. Although there has been a considerable decline in recent years the impact on employment under the EGS is impressive by any standards, particularly, as compared to other anti-poverty programmes in India or any other country.

The contribution of the EGS to the employment needs of Maharashtra are covered under following aspects:

EGS Contribution to the Employment of Rural Wage Employed: In 1987-88, the EGS provided 133.3 million person days of employment. This figure, however, relates to both wage employed (mainly landless labourers) and cultivators. If we assume that 50 per cent of the EGS employment is provided to landless wage labourers (as shown in some field studies), this figure would be 66.7 million in 1987-88. According to NSS 43rd Round, there were 5.6 million male and 4.5 million female wage employed workers above 15 years in 1987-88. Since recent data on number of average days worked by a labourer is unavailable, use of the 1974-75 Rural Labour Enquiry (RLE) is made. If a standard person year consists of 300 days, according to RLE data there were 79 and 120 unemployment days for males and females respectively in Maharashtra. If these days are applied to the wage employed workers, the total unemployment figure among the wage employed comes to around 981 million person days whereas the EGS employment to target group was only 66.7 million person days. It would thus appear that the scheme was able to eliminate approximately no more than 7 per cent of unemployment among this group in 1987-88 [Osmani 1991].

Percentage of the EGS Labourers to the Total Rural Workers: The average labour attendance under the EGS was 5.2 lakhs in the year 1987-88. In the same year the NSS 43rd Round data reveal that there were 21.2 million workers (self employed as well as wage employed) above 15 years. Thus the share of the EGS workers in the total rural workers was only 2.5 per cent in the state.

Funds Needed to Remove Rural Unemployment in the State: The EGS provided 133.3 million person days in the year 1987-88. The cost per person day and

average wage per person day were Rs 19.1 and Rs 9.11 respectively. Using the same calculations done for the wage employed above, the required person days for all the rural workers (who were around 21.1 million) would be around 2,188 million. If the same cost and wage rates under the EGS are applied to these person days, the total cost and expenditure on wages come to around Rs 41,700 million and Rs 19,931 million respectively. Against this the total cost on the EGS was Rs 2,350 million and on wages it was Rs 1,350 million. It would appear that the share of the EGS in the total cost needed to remove unemployment in a year in Maharashtra comes to only 6 to 7 per cent. In other words, if unemployment has to be removed through public works, there should be almost 20 times increase in the EGS expenditure.

Employment and Income under Micro-Studies: Turning to micro studies, the employment provision of person days per person in a year varies from 25 in GOI (1980) to 160 in Dandekar (1983) (Table 9). A study on Shirapur and Kanzara villages shows that in the five-year period from 1979-80 to 1983-84 days worked on EGS represented about 20 per cent of the total employment in Shirapur and 10 per cent in Kanzara [Bhende et al 1990]. Datar's study (1988) reported that the contribution of EGS employment to the total employment of the participants was about 50 per cent in the survey villages. Thus, if the results of micro-studies are accepted the impact of employment for the participating labourers is impressive by any standards. Similarly, as shown in Table 9, contribution of EGS to income of the EGS households is quite substantial.

Impact on Women: It is worth noting that in rural Maharashtra, the EGS is known as a 'programme of women'. The estimates of the proportion of women on the EGS varied from 39 per cent [PEO 1980], 51

per cent [Dandekar 1983], 49-80 per cent [ISST 1979] and 45-64 per cent [Datar 1988]. These large percentages could be due to the predominance of female labour in casual unskilled work in rural areas. The study by Datar (1988) is the latest one on the impact of EGS on the women. This study showed that the EGS formed a core income for many women. Dantwala, however, is not very happy to find that the EGS has become a 'programme of women'. His preferred option for women would be supplementary employment in their household premises, so as not to disrupt their domestic work/duties.

Stabilisation Benefits to the Poor It is important to note that it is not enough to look at the direct benefits in form of employment and income generated by the EGS. Other indirect or the so-called general equilibrium effects and the stabilisation benefits of the EGS on the poor also need to be taken into account. EGS contributes to the creation of rural assets. Between 1975 and 1986, the number of projects sanctioned was around 1,73,000 out of which 68 per cent was completed. The EGS can have substantial impact on agricultural growth and wages. The EGS projects mainly relate to soil conservation, land development, percolation tanks, irrigation, road works and afforestation. By the end of the 1980s, more than 6,000 percolation tanks were completed. One of the criticisms of the EGS is that the benefits of the created assets go to the non-poor. However, recent sub-schemes such as horticulture programmes and the Jawahar Well Scheme are intended to help the lands of small and marginal farmers.

It should also be noted that the poor could derive continuing benefits if there is agricultural development due to EGS assets. A recent study by Sathe (1991) informs that the assets created under the EGS led to improvements in agriculture and rural non-agricultural activities. There is also evidence that the EGS wage rate influenced the general agricultural wage rate in the state. Employment generation schemes can have the effect of raising the reserve price of labour.

One of the most important aspects of the EGS is its seasonal stabilisation effect on the incomes of the poor. Reducing fluctuations in income can matter as much to the poor as raising average incomes. It can prevent acute distress and costly forms of adjustment such as selling productive assets. In other words, even if the increase in income is not large, the existence of a form of income or employment insurance (particularly in the absence of effective institutional credit) can be quite significant. Although only 0.5 to 0.7 million workers (out of 20 million rural workers in the state) participate in the EGS, all rural workers

value the insurance function of the EGS and view the scheme as a form of security. Famine prevention is another important benefit of the scheme.

The importance of the EGS lies in its guarantee of work. If employment is made an entitlement, the EGS can facilitate collective political action by the poor, and can promote the realisation of their common interest. The EGS can also have the effect of making rural politicians more responsive to the demands of the poor. It can provide the poor with opportunities for effective action and encourage the mobilisation of their political resources.

EGS work can have an impact on the social life of workers. Concentrating large numbers of workers in one place in similar conditions and increasing their interaction helps to break down social differences. We have already noted about the positive impact of EGS on women. There is evidence that rural urban migration has been somewhat reduced because of the EGS. An absence of the EGS would thus have consequences for urban poverty also.

This is not to suggest that everything is rosy about the EGS. There are problems that relate to the design and implementation of projects, corruption, people's participation and so on.

Opportunity Cost to the Workers Participation in the EGS involves some costs to the workers. Opportunity cost here is defined as the expected wage foregone by participating in the EGS when that person works on his/her farm or on his/her household or chooses leisure. The gain to the worker is the excess of the EGS wage over his/her reservation wage. A study by Datt, Gurav and Ravallion (1992), on two villages of Maharashtra, however, found that the foregone income due to employment on the public works is quite low—around one quarter of gross wage earnings, most of the time displaced was in domestic labour, leisure and unemployment. It shows that workers do not lose much by participating in the EGS at least in the studied villages.

EGS AND OTHER ANTI-POVERTY PROGRAMMES

Various evaluation studies have revealed that the performance of the EGS is much better as compared to other anti-poverty programmes in India such as NREP, RLEGP and IRDP [Acharya 1990 and World Bank 1989]. Although all the anti-poverty programmes are designed with safety net objective, the EGS has been more successful than NREP and RLEGP in controlling the type of works taken up and the quality of implementation. None of the other programmes have sustained large-scale operations for a lengthy period or dealt with corruption and other administrative

problems as effectively as the EGS [World Bank 1989].¹⁰ Hirway and Terhal (1991) have made an interesting comparison of rural public works programmes in 11 Indian states, China, and Bangladesh [Bhatt 1991]. According to this study, Maharashtra's EGS and West Bengal NREP have performed better than those of Gujarat and Karnataka. However, the rate of Maharashtra's EGS is lower than that of China and Bangladesh. It shows that there is lot of scope for improvement in performance of the EGS.

The EGS has almost completed 20 years of its existence. Now the questions posed are: (a) How long the programme will continue or how long will it be sustained? (b) Has the programme fulfilled its objectives, namely achieving labour absorbing capacity in the main stream so as to bring about decline in the demand for the scheme? (c) Are there any new directions in the scheme?

The available evidence shows that the EGS is yet to fulfil its objectives except in a few pockets like Ralegaon Shinde and some areas surveyed by Sathe (1991). Due to this, the scheme is going to continue in future. Regarding sustainability of the scheme, finance does not seem to be a problem in the immediate future although the costs are going to be high due to doubling of wages in 1988. In recent years, however, Maharashtra government has changed thrust of the EGS to new directions.

Shram Shaktidware Gram Vikas Under the government resolution (Planning Department, June 22, 1989), the government has formulated a special program captioned as 'Shram Shaktidware Gram Vikas' (village development through labour) as a subscheme of the EGS. The optimum utilisation of the water received during year well conceived planning of the entire village, land utilisation of village, optimum food production, development of labour-intensive small industries, 'Ambar Charkha', sericulture, etc. are basic aspects of village development. It is proposed to operate all these development works in a village in an integrated manner. The government has also introduced comprehensive watershed development programme (COWDEP) for the EGS irrigation works.

Horticulture Programme Linked with EGS With effect from June 1990, the government has launched a horticulture programme linked with the EGS. Plantation can be taken up on a minimum of 1 hectare and maximum of 4 hectares of beneficiary. The programme will be executed at 100 per cent government cost on the lands of SC, ST and small farmers per definition of National Bank for Agriculture and Rural Development (NABARD).¹¹

Jawahar Wells under the EGS: Jawahar Well Scheme on the pattern Jeevandhara Well scheme of the Indian government was started under the EGS from September 1988. Under this programme, wells are undertaken on the land of small and marginal farmers who are below poverty line. However, the scope of this scheme has since been widened with effect from December 1991; under the modified scheme construction of wells programme is to be taken on the lands of small farmers as per the definition of NABARD.

DELIVERY AND RECIPIENT SYSTEMS

Framing of rules and mere enactment of laws are no guarantee for effective delivery of the EGS benefits. Delivery in the case of the EGS can be related to three aspects, namely guarantee of employment, improving the incomes of the beneficiaries by providing wages according to their work and creation of productive assets for rural development.

As mentioned earlier, elaborate arrangements are made to deliver the EGS benefits to the recipients. The revenue department must be prepared to provide work on demand but it is the irrigation, agriculture, forestry and other departments which draw up advance plans for works in groups of villages, and then on instruction, execute individual projects using the EGS labour. Official instruction, informal guidelines, extensive monitoring, unscheduled field visits, vigilance tours by officials at various levels, and the advisory and supervisory role of non-official status statutory committees help in delivering the EGS benefits.

What distinguishes EGS from other rural employment programmes is the statutory, judicially protected work guarantee. However, employment is sometimes not 'guaranteed' due to several factors relating to design as well as implementation. Firstly, the procedure of getting employed under the EGS is lengthy and is riddled with bureaucratic procedures. As mentioned above, the labourers have to fill up many forms to get employment under the EGS. Since most of the workers are illiterate, it is difficult for them to fill up these forms.

Secondly, even the officials of the programme consider the EGS as an employment of last resort, instead of considering it as an anti-poverty programme. They expect labourers to search for better employment opportunities regardless of the fact whether such opportunities existed. Thirdly, the administration faces difficulties in identifying and designing works in the vicinity of the villages and consequently the EGS is not able to provide continuous employment in relation to the need. Moreover, since the guarantee of employment is provided only at the district

level, many labourers are unwilling to migrate from one taluk to another. The earnings and the extent of employment under the EGS are also not attractive enough for the labourers to migrate out.

Fourthly, the needy labourers are supposed to be informed of their right to work and the procedures of wages, etc. by the district and taluka level employment guarantee committees and the work site committees. Some micro studies however show that very few people know about the procedures followed under the EGS. One micro study on Thane district revealed that not a single respondent viewed the scheme as a right-to-work scheme [Deshpande 1988].

Lastly, there is considerable uncertainty and anxiety about the period of employment, as the state is required to provide employment for a minimum of 30 days at a stretch. Thus, there are problems of unemployment between projects [Herring and Edwards 1983]. Further, the landless workers are interested in daily wages and not weekly or fortnightly wage payments. Besides these, complicated wage policy, corruption, political interference discourage the workers to undertake the EGS work.

Regarding delivery of wages, according to the EGS design the recipients are supposed to get minimum wage if he/she works seven hours a day. Many micro-studies, however, reveal that the recipients are getting less than minimum wages. There have been cases of corruption and leakages because of the complicated piece rate system. With regard to assets, factors such as political interference, rivalry between revenue and technical departments, lack of proper blueprints, lack of overall co-ordination, delay in implementation, lack of maintenance, shift in emphasis to roads, etc. have contributed to the less productive nature of the EGS assets. Also the volatile demands of the recipients create problems for the delivery system. Droughts, natural calamities or even seasonal changes cause dramatic shifts in demand. Even with relatively flexible administrative structure of the EGS, it is difficult to make adequate adjustment [Echeverri-Gent 1988]. Because of sudden increase in demand, new projects have to be undertaken which may be of little productive value [Dantwala 1978].

It is noteworthy that the delivery system is much better in areas where voluntary organisations are active. A study on Jawahar taluka of Thane district [Deshpande 1988] shows that the existence of a receiving mechanism in the form of a labour organisation helped in improving the delivery of the EGS benefits. The role of the organisation in securing benefits to the labourers was clearly demonstrated by the differential implementation of the scheme in different pockets of Jawahar taluka.

Some other benefits of the intervention of the VA are: (a) The organisation has helped in spreading awareness of the scheme among the poor and illiterate labourers; (b) It mobilised labour to make demands on the administration for provision of employment; (c) It checked malpractices and leakages from the scheme to a certain extent, and on some occasions helped the administration in resolving field level conflicts.

The study [Deshpande 1988], however, points out that the organisations were unable to raise consciousness beyond the elementary level of making demands for provision of employment. Acharya (1990) also attaches the importance to voluntary organisations in delivering the EGS benefits to the recipients.

LESSONS FROM THE EGS

The EGS has a lot of lessons to offer from its two-decade experience. Some of the lessons relating to employment, wages and assets are as follows. (1) The main short-term objective of the scheme is to provide relief to the poor by increasing their incomes. It does this by providing them with employment which is guaranteed in the lean season, and to those unemployed during the peak season. Elaborate nationwide organisational arrangements are needed for delivering the guarantee of employment in order to replicate the EGS. Proper care has to be taken in the design and implementation in order to avoid dilution of the 'guarantee' of employment. (2) Another important lesson to be learnt from the EGS is regarding the wage rate to be followed in rural public works programmes. The dilemma to be resolved is whether it should be at statutory minimum wage level or below minimum wage level (generally market wages are below minimum level). Initially the EGS wages were below the market agricultural wages. In 1988, with the doubling of the statutory minimum wage rate, the EGS piece rates were also doubled. Ravallion et al (1993) reveal that higher wages led to rationing in the guarantee of employment. They argue that lower wages should be maintained in order to have wider coverage which would help the poor better as compared to the rationing due to higher wages. This issue should be resolved before replicating the EGS to other states. There is some merit in the low wage argument if one wants to concentrate on reducing the intensity of poverty. However, if the aim is to take the poor up to the so-called poverty line, obviously higher wages are needed. (3) The long-term objective of the EGS is to create productive rural assets which in turn contribute to growth in employment and income on a permanent basis. There is no general agreement on the

developmental impact of the assets created under the scheme. In this context, lessons from the EGS would be useful for employment programmes in other states. Analysing the general equilibrium effects, some studies suggested that a well designed, executed and targeted rural works programme has the greatest impact on the poor [Narayana et al 1988, Parikh and Srinivasan 1990]. (4) There are many lessons to be learnt from the role of voluntary organisations for improving the delivery system under the EGS. (5) For replicating the EGS in rest of the regions, one has to keep in mind the special features of Maharashtra. Large part of the funds for the EGS is provided by a prosperous urban sector of the state. Also, politically powerful rural elite in the state succeeded in extracting finance from the urban sector for the EGS in order to get benefits from the assets created in the rural areas.

V

Conclusions

While examining poverty alleviation programmes for the rural poor in Maharashtra, the article made an attempt to (a) analyse its macro-economic, demographic, political and institutional dimensions, (b) examine characteristics of poverty, (c) assess the major anti-poverty programmes in the state, and (d) critically evaluate the EGS.

Given all the limitations in the EGS design and implementation, many studies have shown that the EGS has made positive impact on the levels of living of the rural poor in Maharashtra. The person day unemployment rate based on NSS data declined considerably over time in the state. The performance of the EGS in terms of employment creation, raising incomes of the poor and checking leakages is much better than any other anti-poverty programmes in India. There are also many indirect benefits due to the scheme. However, EGS alone cannot remove the entire poverty in rural areas of the state. EGS seems to be successful as a supplementary programme. Regarding application of the EGS to other states, as Dantwala argues, following two pre-conditions need to be insisted upon: First, prior establishment of a competent decentralised district planning and implementing agency, and second meeting the cost of the scheme through (additional) taxation.

As regards poverty, in spite of the decline in the 1980s, the incidence of poverty is quite high in the state as compared to many other states. The indebtedness levels are also quite high among agricultural/rural labourers in the state [Mathrani and

Acharya 1990]. The solution to poverty alleviation in Maharashtra in the medium- and long-term lies in the development and adoption of suitable technologies to make the poor in the dry land communities economically viable by improving the productivity of their agriculture (Rao 1991). In this context, watershed development programmes, village development programmes *a la* the experiences of Ralegaon Shindi and the new programmes initiated under the EGS are a step in right direction.

Notes

[Revised paper prepared for the project on 'Management of Poverty Alleviation Programmes in States of India' undertaken by Institute of Development Studies, Jaipur. The author is grateful to M.L. Dantwala, Jean Dreze, Indira Hirway, V.K. Ramachandran, M.H. Suryanarayana and participants at two workshops at Jaipur for their comments on earlier drafts].

- 1 On rural-urban disparities in the state, it was commented that Bombay's Nariman Point was comparable to Manhattan whereas some parts of rural Maharashtra could be compared to sub-Saharan Africa. See Padmanabhan (1992).
- 2 Historically, Konkan, western Maharashtra, Vidarbha and Marathwada are the four main sub-divisions of the state. In terms of economic development, there are enormous differences among these regions. For details, see GOM (1984).
- 3 Even in the year 1990-91, the proportion of cropped area under irrigation was only 12 per cent.
- 4 The per capita SDP, the per work value added in manufacturing and per worker value added in agriculture in Maharashtra were Rs 2,960, Rs 19,342 and Rs 2,964 respectively in 1988-89 at 1980-81 prices. The corresponding figures for all India were Rs 2,082, Rs 14,604 and Rs 3,737 respectively.
- 5 The comment is based on the data relating to NSS Employment-Unemployment Surveys, 27th and 38th Rounds. See *Sarvekshana*, Volume 6, No 3, January-April 1983 and Volume XI, No 4, April 1988.
- 6 See Sundaram (1989) for the factors responsible for the disparities in the female participation rates across states.
- 7 See Swaminathan (1990) for a discussion on how IRDP is successful in West Bengal.
- 8 The micro studies are: Deshpande, V.D. (1982), Programme Evaluation Organisation (1980), Institute of Social Studies Trust (1979), Dandekar and Sathe (1980), Dandekar, K. (1983), Bhende et al (1990), GOM (1982), RIDC and Kirlonskar consultants (1985), Deshpande, S.K. (1988), Acharya and Panwalkar (1988), Datar (1988), Sathe (1991). Some studies and comments based on micro as well as aggregate data are: Renolds and Sunder (1977), Dantwala (1978), Abraham (1980), Guhan (1980), MHJ (1980a, 1980b), Tilve and Pitre (1980), Herring and Edwards

(1983), Lieberman (1984, 1985), Bagchi (1984), Rath (1985), Dandekar, V.M. (1986), Echeverri-Gent, (1988), Dreze (1990b), Acharya (1990), Ezekiel and Stuyt (1990), Gaiha (1990), Godbole (1989, 1990), Hirway et al (1990), Kakwani and Subba Rao (1990), Ravallion (1991), Ravallion et al (1993), Subbarao (1992).

Some theoretical studies on rural public works are: Basu (1982), Narayana et al (1988), Parikh, and Srinivasan (1990), Ravallion (1990).

- 9 Some of the non-official committees are: the EGS Council, Committee of Legislature on the EGS, District EGS Committee, Panchayat Samiti Level EGS Committee, Work Site EGS Committee.
- 10 In their reviews on poverty programmes on developing countries Osmani (1991) and Ravallion (1991) also feel that the performance of the EGS is better than other programmes.
- 11 The definition of small and marginal farmers, according to the criteria developed by the National Bank for Agriculture and Rural Development is related to productivity of land and its income-generating capacity and covers landholders up to about 28 hectares in drought-prone areas.

The journal is the pre-eminent forum for the presentation of research material on Indian and South Asian societies and cultures and for the discussion of different approaches to their study. The journal publishes neither purely theoretical essays nor purely ethnographic accounts but favours papers in which data and theory are mutually related. Occasionally papers dealing with themes of cross-civilisational significance, bringing in data from non-South Asian societies are also published.

Public Intervention for Poverty Alleviation in Harsh Agro-Climatic Environment

Care of Rajasthan

Vidya Sagar

Rajasthan is characterised by sharp regional contrasts in agro-climatic conditions as well as by fluctuating levels of rainfall and consequent frequency of drought conditions. Although there are regional variations in poverty levels, overall the state has a very low level of economic and social development, coupled with a negative record of achievements in poverty alleviation. An examination of the functioning of PAPs suggests that an emphasis on infrastructural development, especially watershed development and reforestation, along with programmes of employment and asset redistribution, is most needed in this state.

RAJASTHAN is the second largest state in the country accounting for 10.4 per cent of the total geographical area. More than half of the state's area is desert with a very low density of population. Its share in the country's population is only 5 per cent.

The state provides us with a number of contrasts. Along with highly developed agricultural pockets such as Ganganagar and Chambal command area it has districts like Jaisalmer where there may be little agricultural production for years together. The annual precipitation is more than 100 cm in south-east Rajasthan and only 16 cm in Jaisalmer. According to the 1991 Census the density of population per sq km is as varied as 336 in Jaipur and nine in Jaisalmer. The literacy rate in the state varies from 23 per cent in Barmer to 52 per cent in Ajmer. The rural literacy rates vary between 19 per cent in Barmer and 45 per cent in Jhunjhunu.

Agriculture and animal husbandry are the two principal occupations of the working population. The state has the largest livestock population accounting for 13.5 per cent of the total livestock of the country. The state's contribution to the country's foodgrains output during the triennium ending 1990-91 was 5.82 per cent, while it accounted for 9.6 per cent of the cropped area under foodgrains. The per capita production of foodgrain during this period was 229 kg as against the national average of 204 kg. The contribution of the primary sector in the SDP hovered around 50 per cent throughout the 1960s and the 1970s.

The state has passed through a period of rapid re-organisation in terms of land relations. The feudal arrangements of the old princely order have given way to owner-cultivation land rights for a majority of farmers. Investment in rural infrastructure as well as in agricultural activities has been made under the various plans. Production and productivity indices show a rising trend in spite of large variability in output from year to year.

The level of per capita SDP is among the lowest in the country. At the same time, the

state is considered by many one of the major states with a low poverty ratio. Furthermore, it is the only state where achievements in terms of poverty alleviation have been negative during the period 1977-87 when maximum emphasis was laid on poverty alleviation [Minhas et al 1991]. This calls for a re-examination of the role of public intervention via the poverty alleviation programmes.

The paper examines trends in the nature and composition of poverty in Rajasthan and attempts to evaluate the role of public intervention in poverty alleviation. The first two sections discuss the socio-economic background and rural economy of the state. Section III describes the poverty population – its composition, dispersal, nature of poverty and trends in poverty. Section IV examines the trickle-down of growth to the poor. Section V looks into the impact of the first major intervention, viz, land reforms. Direct poverty alleviation programmes and their impact on the poor are discussed in Section VI. The last section discusses the lessons of the poverty alleviation efforts in the state.

While writing this paper, we have been constrained by the availability of research material, particularly in the regional context. We have tried to piece together whatever scanty material we have been able to obtain and draw conclusions which at times may look more like conjectures.

I

Socio-Economic Background

Growth of population in Rajasthan has been amongst the highest in the country. Population growth rates for the state were, on an average, 5 percentage points higher than the national average during the last three decades. As a result, the state's share in human population has increased from 4.4 per cent in 1961 to 5.2 per cent in 1991. The total population of the state in 1991 was 44.1 lakh. The share of rural population during 1961-91 has declined from 84 per cent to

77 per cent. The bulk of growth in the rural population during 1971-91 was in the arid western and northern regions. The main explanation for such high growth in these areas is the colonisation in the Indira Gandhi Nahar (canal) area and falling death rate with stable birth rates [Rambardhan 1989].

The occupational structure in the state is predominantly agriculture based and has changed only marginally during 1971-91. The share of main workers (male) in agriculture (cultivators and agricultural labour) declined from 72.7 per cent in 1971 to 68.8 per cent in 1991. Fifty per cent of the main workers in 1991 were cultivators.

Nearly half of the cultivated holdings belonged to the small and marginal farmers in 1982. Due to wide regional variation in land productivity, assessment of the economic condition of larger land sizes may not be easy. There is a negative correlation between the average size of landholding and land productivity (Table 1). In western desert districts the number of small and marginal farmers was less than 6 per cent and the average size of holding was 1.5 ha in 1981. In south Rajasthan nearly 66 per cent of the holdings are below two ha with an average size of holding at 2.03 ha. The index of land productivity in the two regions, with the state value as 100, was 40 and 187 during the mid-1960s [Sagar 1978]. This is not to deny that large inequalities are present in the distribution of land, but only to show that the state level distribution is inadequate to show the real situation unless adjustments are made for the variations in land productivity.

Unlike some of the other poorer states the incidence of agriculture labour is not high except in the canal irrigated region of Ganganagar and south-east Rajasthan, where 20.2 per cent and 14.6 per cent, respectively of the main workers are agricultural labourers. In the 1991 population census 10 per cent of the main workers are classified as agricultural labourers (Table 3). According to the 1987-88 NSS estimates the number of agricultural labour households has

increased from 11.1 per cent in 1983 to 12.6 per cent. In contrast, the share of all rural labour household has doubled from 17.26 per cent in 1983 to 34.15 per cent in 1987-88 due to widespread drought conditions prevailing in the state during the later period. More than half of such labour households are landowners. The number of labour households with land has remained constant at around 53 per cent during 1963-83 but increased to 80 per cent in the drought year 1987-88.

The economic condition of SC and ST households in rural Rajasthan appears to be relatively better than those in other states. Together the two groups account for 31 per cent of the state's population. Eighty per cent of ST main workers as against 60 per cent SC and 73 per cent overall main workers are engaged in cultivation. The number of SC main workers classified as agricultural labourers is highest at 19.2 per cent, as against 9.9 per cent for ST and only 8.3 per cent for other social classes. According to the 1987-88 NSS estimates, the number of ST agricultural labour households is 19 per cent as against 38.4 per cent SC household and 21.1 per cent overall. A significant feature of scheduled caste households is that their number in total rural households is increasing while that in agricultural labour households is declining. This is indicative of the improvement in the economic conditions of SC households. However a more rigorous examination of the economic conditions of such households is needed to establish this conclusively.

II Rural Economy

Three predominant factors characterise the rural economy of the state. These are (i) a large share of the primary sector in the state domestic product; (ii) wide fluctuation in agricultural production, mainly kharif production due to low and erratic rainfall; and (iii) livelihood security provided by the livestock sector which produces 40 to 70 per cent of the gross value of agricultural output and provides a stable income stream for the rural poor. The structure of the rural economy has undergone changes during last three decades.

The overall growth performance in the state has been one of long run stagnation till 1980-81. The growth rate of SDP at constant 1970-71 prices during 1955-56 to 1970-71 was 0.56 for primary sector and 1.76 per cent overall – both of these growth rates are statistically insignificant even at 20 per cent level. The per capita growth in SDP has been negative at -1.58 and -0.51 per cent for primary and overall. The growth performance improves during the 1970s only to register a zero overall growth in per capita SDP. The per capita growth

in the primary sector is negative (-1.46 per cent).

It is only during the 1980s (1981-91) that the economy showed some signs of growth. The primary sector has grown during this period at the rate of 4.5 per cent per annum while the overall growth performance is even more impressive at 6.3 per cent. The per capita growth performance is therefore equally good during this period.

The average share of the primary sector in SDP during the trienna ending 1960-61, 1970-71, 1980-81 and 1990-91 was 59.0, 53.7, 52.6 and 45.7 per cent, respectively. The rate of decline in the share of the primary sector in SDP during 1954-55 to 1980-81 is 0.20 percentage points per annum. The decline in the share of the primary sector quickens in spite of an impressive growth in this sector during the 1980s. The trend rate of decline was 0.83 per cent points per annum during 1981-91.

GROWTH AND INSTABILITY IN AGRICULTURE

The gross agricultural production in the state has grown at the rate of 5.3 per cent during 1966-79 as against 2.7 per cent during 1953-65. The trend growth rate of agricultural production and productivity during 1981-82 to 1991 was observed at 3.74 and 3.54 per cent per annum respectively. During the earlier period (1953-65) growth was due mostly to expansion in area. Since then almost all the growth in agricultural production resulted from growth in agricultural productivity.

It is important to analyse the composition of growth for it affects the poverty population. Growth in the primary sector during the 1980s was due significantly to a major shift in the cropping pattern in favour of oilseeds. The share of oilseeds in GSA during 1991-92 was 19.7 per cent, as against 6.3 per cent during the triennium ending 1980-81. Both the components of aggregate agricultural productivity, viz, shift in the cropping pattern in favour of high productivity crops and growth in the crop yield, were important. The production of oilseeds in the state has increased from an

average of 4.43 lakh tonnes during the Fifth Plan period (1974-75 to 1978-79) to over 27 lakh tonnes in 1991-92, a six-fold increase. The crops which registered the highest gains in production were rape and mustard, increasing from an average of 1.7 lakh tonnes during the Fifth Plan period to over 22 lakh tonnes in 1991-92. As is clear from Table 7 this growth is equitably shared by all the regions of the state.

An important feature of the state is the wide annual variation in agricultural production. The coefficient of variation in foodgrain production at the aggregate level in Rajasthan during the 1960s, 1970s and 1980s was 18.2, 18.3 and 36.0 per cent, respectively. With over 50 per cent of small and marginal holdings wholly unirrigated (Table 16), the coefficient of variation of kharif production of foodgrain is a better indicator of deprivation for the poor. The coefficient of variation of the production of kharif foodgrains during the three time points is 23.7, 36.4, and 42.1 per cent, respectively. In the past, compensatory movements were observed in seasonal (rabi and kharif) production in most areas. This is clearly reflected in the lower aggregate coefficient during the 1960s but more prominently during the 1970s. This phenomenon has been gradually declining over time as

TABLE 2: DISTRIBUTION OF OPERATIONAL HOLDINGS, 1980-81

Holding Class	(Per cent)			
	Reported		Adjusted for Regional Productivity Differences	
	Number	Area	Number	Area
Marginal	28.96	3.08	23.00	3.50
Small	19.43	6.25	12.01	3.93
Semi-Medium	20.49	12.93	24.39	15.96
Medium	19.96	27.69	29.48	41.24
Large	11.16	50.05	11.12	35.37

Note: The adjusted proportion of operational holdings and area is obtained by weighing such holdings in different districts by the relative productivity index of the district (Rajasthan = 100) for the respective years and rearranging the distribution.

TABLE 1: SOME FEATURES OF RURAL RAJASTHAN

Regions	Index of Agricultural Productivity (1961-66) (state=100)	Average Size of Holding (ha)	Small and Marginal Holdings (1981)		Share of Agricultural Labour (Main Workers) (Per Cent) 1991
			Number (Per Cent)	Area (Per Cent)	
Ajmer-Sirohi	107	3.26	56.4	15.1	12.5
North-east	155	2.39	62.7	21.1	7.7
South	187	2.03	65.9	27.3	7.2
South-east	134	2.86	54.1	17.4	14.6
Ganganagar	100	6.59	16.8	2.8	20.2
Western-arid	40	14.68	5.9	0.4	4.7
Central-arid	61	6.86	26.7	4.1	8.5
Rajasthan	100	4.5	48.4	9.3	

reflected by the aggregate coefficient of variation for the 1980s. This may have been due to over-concentration of resources in smaller and irrigated areas by using the meagre irrigation facilities more for productive rather than protective use. With the dwindling ground water level, the impact of a low rainfall is worst felt by the small and marginal cultivators. [Bhatia 1992].

The district level production figures show a much large variation in foodgrain production. In Barmer, for example, production of foodgrains varies as much as 28, 164, negligible, negligible, and 456 thousand tonnes during five consecutive years of 1966-71 or more recently as 290, 157, 21, 37, one and 77 thousand tonnes during 1983-89. The coefficient of variation of agricultural production during 1962-73 is as high as 71 per cent in the western districts [Sagar 1980].

Over 60 per cent of the state's geographical area is arid and receives very low rainfall. The wide fluctuation in rainfall often leads to drought-like situations. Drought in the state does not simply represent lack of adequate total rainfall but also its distribution during the monsoon. Drought

conditions are, therefore, declared on the basis of information on the 'damage caused to crops' [Government of Rajasthan 1992:30].

Meteorologically severe drought affected Sirohi 17 times; Jaisalmer, Pali and Sirohi 15 times; Sri Ganganagar and Barmer 14 times; Bikaner, Jalore and Nagaur 11 times; Jodhpur: Churu and Sikar 13 times; and other districts between five and 10 times during last 35 years (1957-91). However, severe drought has been declared in the state more often than is reflected by the meteorological data. Between 1970-71 and 1978-79 affected villages exceed 12,000 thrice and the affected rural population exceeded one crore twice. But during the subsequent nine years affected villages varied between 21 and 36 thousand in seven years, with the affected population varying between 1.7 and 3.2 crore (Table 8). According to census figures the population engaged in primary sector activities has increased from around two crore in 1981 to 2.5 crore in 1991. This implies that the affected population during this period varied between 80 and 100 per cent. Meteorologically, each district was affected on an average for half of the years during this period.¹

LIVESTOCK

The rural economy of the state draws as much sustenance from animal husbandry as from crop husbandry. In an economy which is subjected to wide variation in agricultural production and often faces an acute drought situation, livestock provides better and more reliable sustenance. The ratio of gross value of output of livestock to the value of crop output fluctuated between 38 and 68 per cent during the 1980s primarily due to this factor (Table 9). An important feature of the livestock economy is very high equity in its distribution across different holding size classes. The ratio of the number of small ruminants per hundred households with large holdings to the number with the marginal and small holdings does not exceed two (Table 10). The small ruminant is more useful for the rural poverty population of the state. It has been documented that income from livestock fluctuates much less than income from agriculture [Sagar and Ahuja 1987; Acharya 1989]. In arid western region the variation in gross income from farming in a bad to good year could be in the ratio of 1:9 while for livestock it is 1 to 1.2. The coefficient of variation in the case of income from sheep was 3 per cent, for buffaloes in milk 8 per cent and for cows 10 per cent. Compared to this the coefficient of variation in crop production is as large as 70 per cent in the arid districts [Jodha and Vyas 1968; Sagar 1980].

III Extent of Poverty

A large number of poverty estimates are suggested for Rajasthan. Depending on the criteria chosen, such estimates show extents of poverty in Rajasthan as diverse as 56.3 per cent [Bhatia 1974] – making Rajasthan the fourth poorest state in India in 1968-69 – and 13.3 per cent [Dandekar and Rath 1971], making it the state with the lowest poverty population in 1961-62.

Consistent series of poverty estimates are available for the period under study, viz. 1970-71 to 1987-88 (Table 8). Of these the series generated by the Planning Commission and by Minhas have been the focus of debate on the extent of poverty in India. The Planning Commission estimates of the extent of

TABLE 3: OCCUPATIONAL STRUCTURE (MAIN WORKERS ONLY)

poverty in Rajasthan show a decline in the poverty population from 54.7 per cent in 1970-71 to 41.9 per cent in 1973-74, and to 33.5 per cent in 1977-78. This is followed by an increase in the poverty population to 36 per cent in 1983, and unexpectedly, a sharp decline in the poverty population in 1987-88 which was a year of severe drought.

The Planning Commission estimates for 1983 to 1987-88 have been severely criticised by Minhas et al (1991), who have questioned some of the underlying assumptions of their estimates and have provided independent estimates. The estimates by Minhas, Jain and Tendulkar show a decline of 14 percentage points, from 54.3 per cent during 1970-71 to 1977-78. Since then the poverty ratio has increased to 41.8 per cent in 1983 and 41.9 per cent in 1987-88.

Following severe criticism of their estimates, the Planning Commission in 1992 appointed an expert group to review their estimates. The revised estimates of the expert group show a decline in the poverty ratio from 33.7 per cent to 31.5 per cent during 1977-83, as against an increase of 3 per cent according to the Planning Commission. During 1983-88 a further modest decline of 2 per cent is estimated, as against an earlier estimated decline of 10 per cent.

From the maze of confusion created by a large number of alternative estimates of the extent of poverty and the trends in its fall, at least one statement may be made objectively. The fall in rural poverty in Rajasthan during 1970-71 to 1977-78 was rapid. From the initial level of 54.4 per cent rural poverty in Rajasthan declines by 14 per cent according to the Minhas estimates and by nearly 20 per cent according to the Planning Commission. The estimates of the expert committee are identical to those of the Planning Commission for this period. Since then the poverty ratio has increased marginally according to the Minhas estimates, increased for half the period and then declined according to the Planning Commission estimates and declined very slowly according to the expert group estimates. One may therefore conclude that there was constancy or at best a very small decline in the poverty ratio during this period of 10 years.

The poverty estimates since 1970-71 do not support Ahluwalia's hypothesis that rural poverty increases during the year of, or the year following a bad agricultural harvest.² The agricultural year 1970-71 produced unprecedented foodgrain levels while 1969-70 was an average agricultural year, yet it shows the highest poverty ratio for the period being considered. The year 1972-73 was a below normal agricultural year but it shows a fall in the poverty level when compared to 1970-71. Again the year 1973-74 was an above average crop year, and the poverty ratio goes down to 44.9 per cent. The year 1977-78 had a local peak preceded by two equally good harvest years. This year also

saw another significant fall (by 4.5 per cent) in the poverty level. However, the year 1983 (rabi 1982-83 and kharif 1983-84) was another local peak. Foodgrain production for the first time crossed the 10 million tonne mark preceded by two normal years. Yet the poverty ratio does not show a decline. On the contrary, it increases according to both the Minhas and the Planning Commission estimates. The year 1987-88 was an unprecedented disaster in terms of agricultural production but estimated poverty levels remained unaffected.

What explains this neutrality between production levels and poverty estimates in Rajasthan? Two factors may be identified. One, the state is too large and too heterogeneous to be represented in a single statement of a good or a bad crop year. In fact, even during the years of very good overall harvest, large parts may suffer from drought. Second, effective relief measures during drought, such as during the drought of 1987-88, have helped the poor to overcome acute deprivation induced by drought.

COMPOSITION OF POOR

It is difficult to provide reliable estimates of the composition of the poor corresponding to a time point in areas of large annual fluctuation in agricultural activity, even more so when state interventions are introduced to minimise the impact of drought induced scarcities. Such interventions are normally class neutral. Therefore consumption levels of the bottom deciles of the cultivating population (or even the entire population of cultivators in an area or region) may not be different from those of labour households unless drought affects some parts of the state with a predominance of a particular occupation group or social class. However, in a year of good harvest the differences may be relatively large. Such differences may clearly be seen in the distribution of consumption expenditure and the resulting poverty ratios among SC and ST households during 1983 and 1987-88 (Table 12).

Using an identical poverty norm for all rural population groups in a year of abundant harvest viz 1983, relatively small differences in the incidence of poverty among

89-90	25	14015	121	3059	255	166	85

agricultural labour households and non-agricultural labour households are observed. An independent set of state level estimates for these population groups shows that the incidence of poverty is only 50 per cent higher among agricultural labour households than among cultivating and non agricultural labour households. The difference in the incidence of poverty between agricultural labour households and cultivators varies between 100 and 400 per cent in most of the other states [Bhalla 1993].

REGIONAL DISTRIBUTION

A number of states have developed region specific poverty estimates and some states have developed estimates of poverty population even at the district level by using state sample data of the NSSO consumer expenditure surveys. Unfortunately no such estimates are available for Rajasthan. We have generated such estimates for the year 1972-73 from the region specific distribution of consumption expenditure of the central sample using the poverty cut off points of Minhas. The 1987-88 estimates are generated by using provisional state sample estimates of the distribution of consumption expenditure (Table 13).¹ The estimated head count ratio of poverty at the common poverty line of Rs 42.74 is 42 per cent for the western and the north-eastern regions, 60 per cent for the south-eastern region and 86 per cent for south Rajasthan during 1972-73.

This relative situation does not change a decade and a half later for south Rajasthan although the south east shows impressive improvements. The 1987-88 data on consumption expenditure (state sample) still show south Rajasthan to be the poorest region with over 58 per cent of the estimated population consuming below the poverty line. The estimated poverty population is 31.4, 32.5 and 32.8 per cent in the western, north-eastern and south-eastern regions respectively.

NUTRITIONAL PROFILE

The average level of nutrition as shown by calorie consumption increased between 1972-73 and 1977-78, observed a modest decline between 1977-78 and 1983 and a further decline during the drought year of 1987-88. Similar behaviour may be observed in the calorie intake for the bottom decile points (Table 14).

In view of large year to year fluctuations in agricultural production, calorie consumption figures for four consecutive years, viz 1970-71 to 1973-74 are compared for the bottom deciles. Except during the mid-1970s (1973-74 and 1977-78), calorie consumption corresponding to the third decile point is stable at around 2,150. The

corresponding calorie intake level for the second and first decile points are 2,000 and 1,850 respectively.

Table 15 shows calorie intake in the four regions at the income decile points as well as the average intake. During 1972-73 average per capita calorie intake for this region is 1,937 calories as against 2,671, 2,697 and 2,788 calories for the western, south-eastern and north-eastern regions. Except for south-east Rajasthan where it improved by 729 calories, the nutritional levels in the other three regions declined in 1987-88.

South Rajasthan observed an average intake level of 1,909 calories in 1987-88. Calorie intake at the bottom three decile points of the distribution of consumption expenditure is 1,333, 1,409 and 1,496 calories in south Rajasthan, 2,168, 2,355 and 2,376 calories in south-eastern Rajasthan, 2,018, 2,139 and 2,234 calories in the north-eastern districts and 1,945, 1,952 and 2,112 calories in the western districts. Nutritional poverty seems to have increased except in the south-eastern Rajasthan in a year of extreme drought. Yet the changed magnitudes of nutritional intake do not give an indication of a near total crop failure (e.g. in the western region).

IV Agricultural Growth and Rural Poverty

In the following we shall discuss achievements from rural development for the two identified groups of rural poor, viz (i) small and marginal farmers, and (ii) rural wage earners. We shall focus on two points: (i) gains from the development of irrigation and (ii) gains from a shift to high value crops and better technology for small and marginal farmers.

IRRIGATION DEVELOPMENT

The general hypothesis on the distribution of irrigation in India is that smaller holdings have proportionately higher areas under irrigation. Some scholars hold the view that irrigation development in India is inequitous [Srinivas 1992]. Overall the distributive aspects of irrigation development in the state can be viewed in Table 16.

In 1970-71 the number of wholly unirrigated holdings declines from 69 per cent for the 0-0.5 ha class to 52 per cent for the 4-5 ha class and then increases to 89 per cent for the 40-50 ha class. The share of area under wholly unirrigated holdings does not increase as rapidly as their number. However, the 1980-81 data show greater equity in favour of the smaller size classes in the distribution of both area and number. Comparing the difference in the percentage of wholly unirrigated holdings within a size class between 1970-71 and 1980-81, it may

be observed that for the bottom class, the decline in the number of unirrigated holdings is the highest at 11.56 per cent. This decline in the proportion of wholly unirrigated holdings gradually reduces with the increase in holding size and becomes negative, implying an increase in the proportion of unirrigated holdings beyond the 5-10 ha size class. Similar is the case of area under wholly unirrigated holdings. The decline in the proportion of area under wholly unirrigated holdings is the highest at 22.22 percentage points for the bottom deciles. The decline gradually reduces until it becomes zero at around 10 ha and negative thereafter. Irrigation development clearly is equitable in this sense.¹

A disaggregated analysis at the regional level however shows mixed trends. Different trends for areas primarily served by lift irrigation and areas primarily served by canal irrigation are observed. In the former comprising south Rajasthan (Udaipur and Chittorgarh) and semi-arid north-eastern districts and central districts (Jhunjhuni and Sikar), inequity in the distribution of irrigation has increased between 1970-71 and 1985-86. In the canal region (south-east Rajasthan) and Ganganagar, the distribution of irrigation shows greater equity [Sagar and Reddy forthcoming]. The growing inequity in the lift irrigated areas can be explained by capital intensive energisation of wells leading to over-exploitation and therefore

TABLE 9. GROSS VALUE OF FARM PRODUCE IN RAJASTHAN

lowering of ground water levels [Bhatia 1992] Public irrigation systems, on the other hand, shows greater equity over time. Overall irrigation development should have helped in reducing poverty.

SHIFT IN CROPPING PATTERN

The second dimension of agricultural growth relates to the shift in cropping pattern of the bottom deciles to high productivity/high value crops. As argued earlier, agriculture in the state during the 1980s witnessed a revolution in oilseed production, particularly in the eastern half of the state. The latest year for which agricultural census data on the distribution of cropped area by holding size are available is 1985-86, by which time the oilseed revolution in the state had started picking up. The share of marginal farmers in the area under paddy, wheat, rape and mustard and gram is 11.0, 5.9, 5.7, 4.7 per cent, respectively, although their share in the total cropped area was only 3.1 per cent. For the small farmers these shares are 15.2, 11.1, 10.1 and 9.0, respectively, as against the share in total area at 6.4 per cent. This is indicative of the fact that small and marginal farmers are adapting to new opportunities, although by itself the data cannot establish the equitous nature of change. To what extent this has been achieved by their own efforts, and to what extent the state is instrumental in facilitating the flow of new technology and credit to ensure adequate returns to them, is discussed below.

REAL WAGES

The third dimension of the relationship between agricultural growth and poverty alleviation relates to trends in real wages and income of rural wage labour households. Trends in real wages are important not only for agricultural labour but also for small and marginal farmers, because many such cultivators get a sizeable part of their earnings from wage labour.

Table 17 shows the growth in real wages between triennium ending 1973-74 and 1984-85, respectively, in a few high wage states. The trend rate of growth in male real wage (MRW) during the period 1970-71 to 1983-84 was 1.96 per cent per annum in Rajasthan. The growth in net domestic product in agriculture at constant prices (NDPAC) in the state was 3.51 per cent during the same period. There are other states in which higher growth in real wages is recorded compared to growth in NDPAC. These include Andhra Pradesh (NDPAC 2.13 per cent, MRW 3.44 per cent), Kerala (NDPAC 0.05 per cent, MRW 2.42 per cent), Bihar (NDPAC 1.03 per cent, MRW 2.41 per cent) and Gujarat (NDPAC 3.83 per cent, MRW 3.23 per cent) [Joshi 1988].

The growth in female wages has been higher than that of male wages. What is

particularly noticeable is the growth in female real wages in the low wage areas of south and south-eastern Rajasthan. In 1970-71 the money wage rate for female labour was Rs 2.30, Rs 2.18, Rs 1.84 and Rs 1.67 per day in the western, north-eastern, south-eastern and southern regions, respectively. The real female wage rate increased at an annual rate of 4.4 per cent and 2.5 per cent in the south and south-eastern regions during 1970-84. The growth was much less in other areas. The male wage rate in 1984-85 in south and south-east Rajasthan, was 60 per cent or less of the corresponding wage in western Rajasthan, while female real wages have grown nearly to the levels of western Rajasthan.

Rural Labour Enquiry Reports show a continuous improvement in real wages. At 1956-57 prices the real wage rate for males increased from Rs 1.02 in 1956-57 to Rs 1.26 in 1964-65, Rs 1.25 in 1977-78 and Rs 1.66 in 1983 [Saraswat 1993]. Saraswat (1993) has analysed the performance of rural labour households between 1963-64 and 1983. Her analysis shows that the real income of agricultural labour households during this period increased at the rate of 3.0 per cent per annum. The performance of other rural labour households was better; their real income growing at a rate of 4.8 per cent per annum. For male labour, increase in real wages was the most powerful factor contributing to the growth in real income, which showed a growth rate of 1.5 per cent and 3.5 per cent for agricultural and other rural labour households, respectively. The

number of employment days per annum grew at a rate of 1 per cent. In the case of female labour the most important contribution to the growth of real wage earnings came from an increase in days of employment. This is evident from population census results also.

Further evidence of the improving condition of agricultural labour and other labour households is shown in Tables 19, 20-21. Average monthly per capita expenditure (MPCI) at 1956-57 prices for agricultural labour households increased from Rs 13.90 in 1956-57 to Rs 17.59 in 1963-64, to Rs 19.36 in 1977-78 and Rs 21.62 in 1983. For other rural households there was a marginal decline.

TABLE 13. RURAL POVERTY POPULATION BY REGIONS

Year	Region			
	Western	North-eastern	Southern	South-eastern
1973-74	43.5	41.6	55.7	60.4
1987-88	31.9	33.5	55.2	42.8

Note: The regional classification of districts is as follows:
 Western: Bikaner, Barmer, Jaisalmer, Jodhpur, Nagaur and Sikar.
 North-eastern: Ajmer, Alwar, Bhilwar, Bhilwara, Ganganagar, Jaipur, Pali, Sawai Madhopur and Tonk.
 Southern: Banswara, Dungarpur, Sirohi and Udaipur.
 South-eastern: Bundi, Chittor, Jhalawar and Kota.

TABLE 12. THE WEAKER SECTIONS ESTIMATED POVERTY RATIO

					(Per Cent)
Year	Labour Households		SC Households	ST Households	All Rural Households
	Agricultural	Non agricultural			
1977-78 a)	47.65	35.00			30.36
b)	55.00	43.64			38.26
1983 a)	39.87	36.10*	33.70	55.13	28.47
b)	52.70	50.40*	46.97	63.83	39.20
1987-88 a)			48.10	30.40	21.26
b)			65.00	46.10	33.87

These estimates are for all rural labour households.

Notes: 1. Common poverty points as determined by inflating the 1973-74 monetary norm of Rs 49 corresponding to 2400 cal by the CPIAI for the reference time point.

2. Monetary poverty points as given by Minhas et al (1991).

between 1963-64 to 1977-78, but thereafter it grew faster for agricultural labour households. There was a sharp decline in the share of expenditure on cereal consumption from 52 per cent in 1956-57 to 44 per cent in 1963-64, 33 per cent in 1977-78 and 29 per cent in 1983. Such a significant reduction in the share of cereals in total consumption expenditure when only a marginal change in the average daily consumption of cereals is recorded, indicates the improving condition of rural labour households. This is also evident from the declining poverty ratio among rural labour households. For agricultural labour households the decline is from 66 per cent in 1956-57 to 55 per cent in 1963-64 to 48 per cent in 1977-78 and 40 per cent in 1983. For other labour households the figures are 32 per cent in 1963-64, 35 per cent in 1977-78 and 29 per cent in 1983.

V

Public Intervention in Poverty Eradication

LAND REFORMS

As in other parts of the country land reforms in Rajasthan were instituted to (i) eliminate the major source of inequality in rural areas viz. cultivated area, (ii) rationalise agrarian structure and (iii) remove uncertainty among tenants so that they may also contribute to agricultural growth and improve their economic status. Abolition of functionless intermediaries, ceiling on holdings and protection of tenants were the three main strands of the legislation enacted to usher in the reforms. Most of these reforms were initiated in the 1950s and were more or less completed by the 1960s.

The overall conclusion about the first phase of land reforms is somewhat positive. Land reforms in Rajasthan were not merely a *de jure* change in the revenue law as is suggested for other parts of India. The second phase of land reforms which tried to impose ceilings on agricultural holdings did not meet with much success. In this respect the Rajasthan experience is no different from the experience in other states [Gupta 1994].

The tenancy reforms of 1955 met with success due to a number of factors. These include (i) changeover from a feudal to a democratic state structure and the acceptance of the concomitant change in tenancy by the ex-jagirdars as a necessary part of the changeover, (ii) generous compensation and concessions and (iii) low land values due to very low and uncertain productivity of dryland agriculture, implying a rather weak incentive to retain jagir lands.

By the mid-1960s when the ceilings came to be enforced, the rural scene had changed both economically and politically. Irrigation, higher prices for produce and the possibilities

of new agricultural technology as well as the increasing pressure on land, led to an increase in land values and greater resistance to curtailment of land rights in the form of imposition of ceilings. Political leadership also passed increasingly into the hands of the rural landed elites. In such an environment not only were the legal provisions of the ceiling legislation inadequate for any redistributive objectives but legal hurdles and administrative collusion further aggravated the process of implementation of the ceilings act.

It may not be possible except in a superficial way to segregate the effects of land reforms from those of other social economic or demographic factors. Also access to land can be meaningful to the new beneficiaries only if the supportive infrastructure of extension credit marketing etc. is also available. In the absence of these supportive services the benefits accruing from land reforms could be easily nullified. This would particularly be the case in a state like Rajasthan which is very poor in respect of such services.

The Indira Gandhi Nahar Pariyojana (IGNP) provided another avenue of rehabilitating the landless or near landless in the state. It was planned to settle over 2,00,000 households, mostly landless, in this area. However, this objective was only partially fulfilled because of faulty settlement procedures and tardy implementation. Also a number of the landless or near landless who did receive land could not

continue to hold it for long due to paucity of resources, lack of extension support and absence of infrastructural facilities. In view of past experience, this avenue, though still open, is not likely to make any remarkable dent on the problems of the landless.

Another approach, which was earlier rejected in the rhetoric of 'land to the tiller', is to free the lease market by affording reasonable protection to both the landowner and the tenant. As in other parts of the country, the lease market was not encouraged, but in fact leasing became either illegal or was decided by the landowner because of the fear of losing land. The number of tenants and the area leased in (as per official statistics) have therefore recorded drastic declines over time even though unrecorded tenancy and crop-sharing arrangements of various kinds continue to be made.

It is quite clear that neither the resumption of land from large holdings nor settlement in new areas is likely to resolve the problem of the poor households dependent on land. If they have to be rehabilitated within agriculture and for that also the scope is not unlimited, only two avenues – apart from the unfreezing of the lease market which may have a long term salutary effect – are open. These are (i) increase in the gross area under cultivation mainly by extension of irrigation and water conservation and (ii) increase in productivity of land so that the size of a viable holding may be reduced.

A word on the role of technology in reducing the size of viable holdings may be

appropriate in a simulation exercise, Mishra (1990) estimated that the new seed-fertiliser technology was likely to reduce the poverty level in western as well as in north-eastern Rajasthan by approximately 28 per cent. No significant change in the poverty level in other regions was established. The simulation exercise included only two crops viz wheat and bajra. While wheat is cultivated all over Rajasthan and is constrained by irrigation, bajra is sown only in north-east and western Rajasthan and has over 35 per cent of the GCA of the state under it. Mishra's analysis shows a large decline in poverty population through adoption of new technology mainly in the two regions (western and north-eastern Rajasthan) which grow bajra during kharif and wheat during the rabi season. What he seems to have missed is the oilseed revolution that was taking place all over the state during the 1980s. The growth in the production of oilseeds, which is argued above, is more than equitably shared by the small and semi-medium farmers, should have given a further increase to the income of such farmers, thereby reducing the incidence of poverty among them.

CREDIT

The poverty reduction impact of technology operates not only in terms of reduced size of the holding required to earn the given income, but also through enhanced employment in the farm sector. However, extension of new technology is limited, on the one hand by availability of assured irrigation and on the other by the availability of credit to procure modern inputs like fertilisers and HYV seeds. The timely availability of credit is of critical importance.

A reduction in the size of viable holding requires capital for investment both in land augmenting fixed assets as well as in inputs such as seeds and fertilisers. However, the agencies involved in long and medium term lending actually tend to benefit the large farmers and have a bias against the small borrower. Jodha (1971) has documented the phenomenon of over-financing of assets in the case of large farmers and under-financing in the case of small farmers, and has argued that these tendencies accentuate the already disadvantageous position of small farmers who are now compelled to opt for the less efficient but cheaper traditional assets.

Similarly, the structure of short-term production credit did not show any preferential bias in favour of small farmers. The average per hectare availability of short-term credit to marginal and small farmers is not different from those of higher size classes in 1977-78 (Table 22). This is in sharp contrast with the Punjab situation during the initial years of the green revolution. With this pattern of credit availability, the

obvious consequence is the limited use or yield augmenting modern inputs. Data pertaining to the input survey for Rajasthan as well as other micro studies show small holdings generally applied lower doses of fertilisers during the 1970s despite their advantage in irrigation. This pattern gradually changed in favour of the small and marginal farmers during the later years. The 1980-81 figures indicate this. Later years' data further strengthen this shift in favour of small and marginal farmers. As far as the inverse relationship between borrowings per hectare and the size of holding is concerned, yet the number of borrowers from the small and marginal farmer classes was only 26.2 per cent in 1986-87. By then the co-operative credit system came under stress due to default and inadequate circulation (Ghose and Patel 1992).

In other words, the potential for bringing down the size of viable holdings, and thereby lifting several agricultural households above the poverty line with the application of new technology, was not fully realised in practice. This was partly due to the constraints of credit availability. Lack of support from other institutions responsible for new technology and inputs was another factor.

VI Direct Poverty Alleviation Programmes

In a predominantly agricultural economy characterised by large inter-year variations in agricultural output and employment as well as a high incidence of poverty, public action is needed (a) to gradually reduce the core poverty population through asset redistribution or skill generation through programmes such as IRDP and TRYSEM, and (b) to minimise the impact of agricultural fluctuations by restoring entitlement through employment based safety nets as well as public distribution of foodgrains at subsidised prices.

The direct poverty alleviation efforts in the state therefore need evaluation in the light of the nature of poverty. The thrust of

asset and skill based centrally sponsored programmes is to achieve a gradual decline in the core poverty population. State level relief programmes (often supported by central funds) focus primarily on the transient deprivation caused by wide fluctuations in the level of agricultural production.

IRDP

Direct intervention for poverty eradication on a targeted household basis started in India with a rather interesting experiment in Rajasthan in 1978 viz Antyodaya. Based on the Gandhian philosophy of upliftment of the poorest of the poor, first it aimed at identifying five of the poorest families in each of the 33,000 villages and providing them with the necessary asset base that would enable them to cross the poverty line. The

Planning Commission evaluated and lauded its approach which was later adapted by the central government as the Integrated Rural Development Programme and extended to all the states in 1981.

Since its beginning impressive results in the achievement of physical and financial targets are well documented in government reports and documents. Over 10 lakh families have been covered till 1986-87 with an average assistance of Rs 3 000 per family during this period. In view of the fact that livestock provide a large share of income to the rural poor on a rather stable basis emphasis was laid primarily on the animal husbandry sector. Forty-two per cent of the families covered under the programme benefited from livestock assets in 1980-81. Twenty per cent of the families were assisted for minor irrigation. On account of the relatively large leakages in the benefit stream in livestock related assistance and faulty identification in minor irrigation schemes that were reported in evaluation studies the share of these two sectors was reduced considerably in the later years. The share of beneficiaries for animal husbandry and minor irrigation schemes in 1985-86 was 31 and 32 per cent respectively. Beneficiaries in the tertiary sector increased from 31 per cent to 58 per cent during this period.

Official surveys estimate the proportion of IRDP beneficiaries crossing the poverty line to be just below half. The survey conducted at the IDS Jaipur shows the percentage of eligible beneficiaries crossing the poverty line to be 28 per cent in 1983, most of these near the poverty line. Only 29 per cent of the beneficiaries resurveyed five years later in 1987 had their assets intact. One may therefore conclude the success rate is less than 30 per cent.

IRDP has been the subject of extensive debate from the point of view of efficacy, as a strategy for poverty alleviation, as against alternatives such as an Employment Guarantee Scheme (EGS) [Rath 1985, Dantwala 1985, Hirway 1985]. The programme has been subjected to concurrent evaluations and improved successively on the basis of their findings. On account of its countrywide

coverage, the overall conclusions may not differ from one state to another. The relative efficiency of such programmes at the state level can be judged by a few indicators, is reported in Tables 23, 24, 25 and 26 for the years 1985-86, 1987 and 1989.

The efficacy of the programme in enabling the poor to cross the poverty line may be judged from (i) the correct identification of the poor and very poor households (i.e., those with annual incomes of less than Rs 2 265 and 2 266-3 500) and (ii) the proportion of such households crossing the poverty line.

On the first count, the performance of the state is far below the national average. The concurrent evaluation surveys of IRDP report both the distribution of the annual income of the beneficiaries as per record at the time of assistance (reported) and as assessed independently by the investigators during

the course of the survey (assessed). The assessed households belonging to the lower income class were found to be only a third of those reported and therefore assisted (6 per cent) in 1985-86 in the state. The difference in the all India figures of reported households (58 per cent) and assessed

households (35 per cent) in this income class is much less. In 1989 only a fifth of those reported and assisted (50 per cent) actually belonged to the lowest income category. In 1987, the difference in the distribution of recorded and assessed household is relatively low because of the extensive drought situation prevailing in the state (Table 23). On the other hand, 11 and 21 per cent of the household were assessed to be selected from the non-poor category of annual income exceeding Rs 6,400 in the concurrent evaluation surveys in 1985-86 and 1989, respectively.

The distribution of households by annual income derived from the asset obtained through IRDP assistance shows that in 43 to 47 per cent of the cases income generated from the asset is zero (Table 25). This percentage is nearly twice as large as the all India average. The annual income from the asset exceeds Rs 2,000 in 12 per cent cases in 1985-86 and 10 per cent of the cases in 1987. For the households selected from the income group of below Rs 3,500, the minimum income from the asset that would ensure crossing the poverty line of Rs 6,400 is Rs 3,000. The data shows that the probability of this happening is very small. Even if one assumes that all the households whose income from the asset exceeds Rs 2,000 are from the below Rs 3,500 income category—an unrealistically optimistic situation—the numbers would be very low. In fact, most of those earning more than Rs 2,000 from the asset are likely to come from the higher income class [Bhargava 1992]. Furthermore, the available evidence suggests that even this level of additional income is not likely to be sustained year after year, particularly in a highly fluctuating agro-economic environment.

If, in addition, allowance is made for the loss in income for which the IRDP asset has come as a substitute - and this could be large for higher income beneficiaries - the actual number of poor actually crossing the poverty line is further reduced. Additional income from IRDP assets has to be adjusted for the loss in income from some existing sources. This becomes inevitable due to internal restructuring of the household's income earning activities. This point can be validated from the UP data provided by C H Hanumanth Rao and reproduced in a modified form in Table 27. The experience of UP suggests that the ratio of net realised income to the value of asset is roughly 0.33. The ratio declines from 44 per cent for the below Rs 2,265 annual income class to 21 per cent for the above Rs 6,400 income class. This happens primarily because the income foregone to earn additional income from the IRDP asset increases with an increase in the initial income level. The decline in income from other sources in lieu of the income from the IRDP income is 16.6 per cent of the IRDP

income for the less than Rs 2,265 income class. For higher classes it varies between 36.6 and 53.5 per cent of the IRDP income.

The percentage of beneficiaries actually crossing the poverty line (Rs 6,400) in 1985-86 is 26. However, 11 per cent of such beneficiaries are non-poor and another 13 per cent belong to the Rs 4,800-6,400 income category. This implies that only 2 per cent beneficiaries with income below Rs 4,800 could possibly cross the poverty line. This makes the likelihood of any household with an initial income of below Rs 3,500 crossing the poverty line almost zero.

The total number of families covered under the programme till 1986-87 is nearly one million in Rajasthan. The probability that the IRDP enabled a significant number of beneficiaries to cross the poverty line is very small. However, if the initial income distribution of the beneficiaries is ignored, nearly 15 per cent of the beneficiaries or 1.5 lakh households or seven to eight lakh people may have actually crossed the poverty line through IRDP assistance.

All this is not to negate entirely the benefits of such poverty alleviation programmes. There are other benefits of the programme arising out of the scale on which it has been implemented in India. IRDP is known to be the single largest programme of its kind anywhere in the world. When a large amount of money is pumped into the economy the activity levels are certainly affected. Changes take place, some intended and others unintended. Such programmes do help poverty alleviation through linkages to growth, through redistribution, and by putting large finances into the rural economy, besides directly augmenting the incomes of the beneficiaries. There is ample evidence to suggest this that has in fact happened, quite apart from whether the additional income is sufficient to push the household above the poverty line. A significant part of the money, if not all, flowing into the rural economy is in the hands of the poor. It is a direct redistribution effect to that extent. The mere fact that the programme attempts to identify the poor in the village is in itself an advantage for the poor. The impact through growth, if

any, has to be seen over a longer period and not in the very short run.

RURAL EMPLOYMENT PROGRAMMES

Rural employment programmes by their very nature offer only temporary income support and therefore serve more as a safety net during lean periods or during periods of crop failure. Since the wage rates in such programmes are not sufficient to generate assets for the poor, they cannot be seen as poverty eradication programmes for labour households. Poverty eradication may be achieved through higher wages sustained through growth in productivity on the one hand, and asset redistribution based programmes on the other. Also, whatever be the magnitude of employment generation in years prior to the poverty reference point, only the reference period employment generation may have a direct impact on the poor.

We discuss below the experience of Rajasthan with respect to efficacy of rural employment programmes in poverty alleviation (transient or core).

The major centrally sponsored employment programmes, viz., National Rural Employment Programme (NREP), are an adaptation of EGS and the Food for Work Programme initiated during the 1970s. The programmes aim at generating additional gainful employment by creating productive community assets for direct and continuous benefits to the poor, as well as by improving the overall quality of life in rural areas. The second important employment programme is state-sponsored in the form of drought relief.

Table 28 compares the expenditure on drought relief and employment generated from such programmes in 1987-88, as well as the employment generated through such centrally-sponsored employment programmes as NREP and RLEGP during the 1980s.

The available evidence suggests that RLEGP and NREP are not suffering from shortage of funds. The employment situation in a state like Rajasthan overall shows relatively low rates of unemployment, if estimated annually, but a very high rate in the kharif season because of the predominance of a single crop unirrigated cropping pattern. The very structure of employment in the state, unlike in many other states, is such that the centrally-sponsored rural employment programmes are not likely to be successful. This is so because in almost the entire state there is a shortage of workers during the busy season, while there is not much work in the entire single crop unirrigated regions. This suggests not only that poverty and unemployment are not related, but also that the employment creation strategy to deal with inter-temporal changes in employment must be comprised of (i) inter-seasonal variation in employment, and (ii) inter-year variation in employment due to agricultural instability and resulting transient poverty. This is what the state level programmes are doing on a very large scale, as and when needed.

VII Major Issues

Having examined the interface among poverty, policy and performance of the economy in a rather harsh agro-climatic environment, the following major issues emerge.

TRANSIENT POVERTY

The fact that the poverty ratio has been nearly constant since 1977-78 does not necessarily imply the failure of poverty programmes in the state during the period in which the state experienced the maximum thrust in poverty alleviation programmes. Poverty estimates during this period are available only for three quinquennial points. Trend change in poverty is therefore very difficult to analyse without essentially referring to the level and fluctuations in economic activity around these time points. Large annual fluctuations in the level of agricultural activities and the resulting fluctuations in household income make 'transient poverty' a more important component of the overall poverty scene in Rajasthan.

The lower level of agriculture production, even if supplemented by adequate availability of foodgrain, may imply loss of entitlements in general [Dreze 1989], but it affects the poorer households most severely. Unless

employment based safety nets (EBSN) are introduced to restore entitlements, wide fluctuations in the poverty population may occur in drought affected situations.

It has been observed above that both the incidence and severity of drought have been increasing until recently (Table 8). One is not sure whether the intensity of drought as

reflected in the official figures on districts, villages and population affected, has any bearing on the official figures on crop damage as reflected in the agricultural production data. The index of agricultural production, with base as the triennium ending 1981-82, increases from 80 in 1979-80 to 100 in 1980-81, 120 in 1981-82 and 133 in 1982-83, with a corresponding increase in foodgrain production. Yet during all these four years, the intensity of drought was severe affecting all the 26 districts, 31, 21, 23 and 22 thousand villages and population varying between 1.7 and 2.4 crore. Similar inconsistencies are not uncommon throughout the last two decades. Admittedly a drought is too complex a situation to be understood through simple figures, but this kind of inflated response has implications for long term development strategies. The 'balloon model' of crisis management is more reflected in government thinking – relief cum development rather than development cum relief. In the latter case, deployment of relief funds from the centre or the state would only accelerate the pace of development. In the former, it leads to ad hoc short term development plans. The assets created are mostly incomplete structures often needing more funds than originally envisaged for the project. This is so essentially because such projects are not priorities once the crisis is over. For most of those involved in the project, the political system, the bureaucracy or the affected population. By the time such projects become a priority again, due to the emergence of another crisis, the damage is already done.

Government spending on such *ad hoc* relief measures is increasing at constant prices¹⁰ at the rate of 21.6 per cent per annum during 1970-71 to 1988-89. Total relief expenditure on the 1987-88 drought was Rs 950 crore. This was nearly half the total plan outlay of Rs 2,120 crore for the Sixth Plan. This may reflect the growing concern of the state for people's welfare, but also suggests growing ad hocism in the management of development funds. One can reasonably argue that the productivity of ad hoc management of funds should be far less than that of properly managed funds. Some of the recent government policy papers recognise this and indicate a thinking in the right direction.¹¹ To what extent this is implemented and becomes effective cannot be discussed here.

IRDP

The performance of IRDP in Rajasthan, as per evaluation reports as well as other reports, has been far below the national average. One thing that is common to all the states generally but needs special emphasis

in the case of Rajasthan, is the adequacy of investment that could generate sufficient sustained income for the poorest households. The net realised rate of return on the investment is the highest for poorest. To ensure that such households get sustained incomes from the public investment, more liberal adequacy norms may be needed.

Whether infusion of this money through the alternative strategy of employment guarantee programmes could yield better results may have to be examined in the light of high year to year fluctuations in the economic environment. Second, if only the economic returns to labour put into the utilisation of such assets significantly exceeds that through alternative employment avenues, is there an incentive to maintain it? We already have a transient unemployment situation in the state. Third, the capacity of the local economy to absorb more units in the tertiary sector to which most of the investment in the later years has been directed needs to be evaluated and enhanced. The experience so far suggests that investment in the strengthening of available assets and augmenting the productivity of existing assets is far more effective.

Providing assets such as land to produce goods for self consumption may provide better sustenance in a harter economy. Fluctuations in output caused by natural or other factors may not be the only factor affecting entitlements. In a market economy with inadequate access to market intelligence, such variability may be compounded by fluctuations in the market price. The approach of Antyodaya or its reincarnation as IRDP assumed beneficiaries at the bottom of the poverty group to possess adequate asset management skills and correctly so. What it missed perhaps was the orientation of such skills. The asset management skills of beneficiaries were tuned to the subsistence model with imperfect or absent markets. Thrusting upon the beneficiaries the entrepreneurial market model without strengthening their market orientation through gradual exposure to the market, removing the market distortions created by the government machinery or merchants or strengthening their capabilities through training, etc. proved a major bottleneck in achieving the objectives of this much lauded programme. The intra year and inter year fluctuations in income from an asset do affect the efficacy of the programme [Dreze 1990]. Also, excess supply services in one sector without adequate absorptive capacity may actively cut into the entitlements of the poor rather than promote them.

It is argued that faster development of rural infrastructure is one of the ways in which efficiency of IRDP investment may be improved [Rao 1992]. This is all the more needed for a state which ranks very low on

the infrastructure development index. Therefore a combination of strategies involving the two major programmes viz, employment and asset redistribution along with a strong co-operative movement may perhaps yield better dividends. A well structured employment programme in the development cum relief format designed to develop rural infrastructure and watershed development and afforestation programmes to reduce the intra year and inter year impact of agro climatic fluctuations should help both protection and promotion of entitlements of the rural poor in the state.

Notes

[The author is grateful to V. S. Vyas and Kanti Ahuja for useful comments on an earlier version of this paper.]

1. The number of districts reporting severe drought during this period divided by the total number of districts. See Government of Rajasthan (1992).
2. Even his other estimates show a near zero correlation between the two in Rajasthan. See Ahluwalia (1978-1986).
3. The provisional results of the state sample on calorie intake are lower than the central sample results. The differences are more in the bottom deciles. As one moves to higher deciles, the differences narrow down. If regional estimates are supplemented to the extent of the difference in the central and state samples in calorie intake, the regional estimates in 1987-88 still show values lower than the 1977-73 estimates. In the southern region, for example, the observed calorie intakes are lower by 137, 149 and 133 for the bottom three deciles respectively.
4. A part of such change arises from the Markov chain process of shifting the number and area from a higher to a lower size class. The remaining may be attributed to irrigation development. However, if the change in irrigated area is monotonically increasing from an initial level where a higher size class has lower values than lower size classes, then the development has to be equitable. For example, the number of wholly unirrigated holdings in the 1-2 class is 80 per cent and in the class 0-1 is 60.1 per cent. Any increase in the number in the 0-1 class due to the Markov chain process should in fact reduce the proportion of wholly unirrigated holdings, unless only irrigated holdings are divided and shifted to the lower class. Only if it is the other way round should one be worried about the impact of the Markov chain diluting the equitable effect.
5. The year 1974-75 is omitted from the analysis as it shows abnormal depressions in the income level of rural labour following a sudden increase in CPIAL from 284 in 1973-74 to 369 in 1974-75, only to decline to 292 in 1975-76. Since changes in the 1974-75 wages lag behind such spurts in price level, results may not reflect a long term trend. Both 1963-64 and 1983 are the points around which movements in CPIAL are moderate.
6. 1974-75 figures are ignored due to the reasons mentioned above.
7. This section is largely based on Sagar and Ahuja (1987) and Vyas and Sagar (1992).

- 8 'The tenants have immensely benefited from various land reforms. On the whole the implementation of the protective and beneficial provisions of the tenancy law can be regarded as satisfactory. The rural community as a whole has made substantial gains because of the removal of impediments in agrarian progress, the whole process of abolition of intermediaries and implementation of the tenancy law is nothing short of a social revolution in rural Rajasthan.' Dool Singh. A Study of Land Reforms in Rajasthan. Research Programmes. Committee. Planning Commission. Government of India. 1964.
- 9 In a recent study Gupta (1994) shows that the distribution of ceiling surplus land in Rajasthan till March 1993 is less than 1.8 lakh hectares. This is less than 1 per cent of the total area under operation.
- 10 Government spending deflated by using wholesale price index.
- 11 Government of Rajasthan (1992-29). It is important to reiterate this rather trite piece of information because over the years the declaratory processes relating to drought have become routinised exercises in the hands of district level bureaucracy and state level elective political elite with the technical refinements in the relevant scientific knowledge and technology achieved in the last four decades or so being largely unincorporated in the estimation and declaration of drought not only in Rajasthan but in India as a whole.

Institutional Reforms and Poverty Alleviation in West Bengal

Biplab Dasgupta

West Bengal a very poor and very rural state has vastly improved its relative position on a broad range of economic social and rural indicators. Land reforms, the development of panchayats and implementation of poverty alleviation programmes through them, and political mobilisation of the rural poor are the distinguishing features of development since 1977 which account for this progress. However, the state continues to be backward on certain fronts such as co-operatives and PDS development.

POVERTY is never alone. Income disparity and unemployment are two of its closest companions. Any programme for poverty eradication therefore would make little sense and would be doomed to fail from the start unless it is picked with other programmes which come to grips with rising unemployment and inequality. Further, any policy package to work would have to be related to the broader social economic political environment in which the poor live. No matter how emphatically a particular scheme is targeted to reach the rural poor it cannot do so as long as the community and its institutions are closely controlled by the landlords, moneylenders and other vested interests. Land reform and decentralisation of decision-making through the development of panchayati institutions are not, for this reason, mere clichés, but actually are preconditions for the success of poverty alleviation programmes. Finally, it should be recognised that there cannot be a lasting solution to the problem of rural poverty within the perimeters of the rural sector: a narrow sectoral approach would be self-defeating. The long-term solution lies in transferring a significant slice of the surplus rural labour power to the towns and industries.

These are some general remarks by way of introduction to this case study on West Bengal. Section I provides the background, while Section II deals with various dimensions of poverty in the state. In Sections III and IV we deal with land reform and panchayats, and with centrally sponsored poverty alleviation programmes. In Section V Section VI examines the public distribution system and we end with some concluding remarks in Section VII.

I Background

We begin by dispelling some of the prevalent notions about West Bengal's economy and society, and by introducing some of the distinguishing features of the state today – land reform, panchayati

development and the political mobilisation of the poor – which have a bearing on poverty alleviation strategies.

Contrary to the popular impression of a highly urbanised and a highly industrialised area which is coloured by the visual image of the Calcutta metropolis, West Bengal is in fact a basically rural and backward state, a very significant proportion of whose population is poor. Once the Calcutta metropolis and the Durgapur Asansol industrial complex are taken out of the reckoning, the level of urbanisation (overall 27.48 per cent, sixth among the Indian states) is close to 10 per cent in the remaining areas of the state which makes it comparable with Bihar, Orissa and Assam, the three major neighbouring states [Census of India 1993]. Until recently going by NSS statistics more than half the population lived below the poverty line (see Table 1).

While at the time of the independence of the country West Bengal was the most industrialised state and its port in Calcutta accounted for more than two fifths of the sea trade, today it has been overtaken by Maharashtra, Gujarat and Tamil Nadu in terms of industrial development, while the port now ranks fifth and accounts for barely one tenth of the total overseas trade [Government of India 1992]. This state is yet to fully recover from the freight equalisation policy of the mid-1950s (which has been withdrawn only a year ago) which denied the comparative advantage it enjoyed because of proximity to coal and iron deposits and the location of steel factories. The recession of the mid-1960s hit this state the hardest given the composition of its industrial output: e.g. iron and steel and wagon and other engineering industries [Roy 1971, Bengal Chamber of Commerce 1971]. Perhaps no less devastating was the discriminatory licensing policy of the central government as well as the parsimonious allocation of plan funds and credit from banks and financial institutions, despite its industrial heritage and large pool of skilled manpower (see Table 3). All these denied the rural poor alternative earning opportunities in the urban-industrial sector

and visibly slowed down migratory movements towards the towns and cities.

Accounting for 2.7 per cent of India's area but 8.05 per cent of the country's population, this state ranks first in terms of density, 767 per sq km as per the 1991 census. Ever since the partition and loss of the surplus producing eastern region, Bengal has been a food deficit state dependent upon the central government for a substantial supply to be routed through the public distribution system. For a long time, food production remained stagnant and the technology of the green revolution bypassed the state (see Table 4). Only recently has there been a spurt in agricultural production. A significant part of the off-season agriculture is taken up by jute cultivation which, while boosting the earnings of the peasants and the foreign exchange earnings of the country, helps to widen the food deficit [Government of West Bengal 1992]. Jute plantation, a major foreign exchange earner, also occupies a good proportion of land in North Bengal, though given the character of such land it does not take away the alternative of food production [Government of West Bengal 1992].

A significant part of the state, mainly the seven northern districts – Darjeeling, Jalpaiguri, Cooch Behar, Malda, North Dinajpur and South Dinajpur (the last two were until recently two parts of the same district – West Dinajpur) and three western districts – Puruliya, Bankura and Birbhum – are relatively more backward.

It is not widely known, because of the virtual absence of caste and communal strifes, that in West Bengal the proportions of scheduled caste population and Muslims are the highest among the Indian states, the proportions being 23.62 per cent and 21.50 per cent respectively, while scheduled tribes account for another 5.60 per cent. In terms of the number of scheduled castes, it ranks second after Uttar Pradesh. These three categories together account for slightly more than half the population, and what makes these communitywise figures relevant for this discussion is that these are also the three poorest groups in rural Bengal. In other words, half the districts and half the

population – communitywise – are backward. Another major category of population, refugees from East Pakistan – about 5.5 million to start with and probably numbering around 10 million by now – are relatively better off, though, in some of the districts bordering Bangladesh – Nadia, North and South 24 Parganas, Murshidabad, Cooch-Bihar and North and South Dinajpur – they would account for a section of the rural poor [Dasgupta 1987].

POLITICAL MOBILISATION OF RURAL POOR

A distinguishing feature of life in West Bengal (as also in Kerala and Tripura) is the role played by the left wing political parties and their peasant organisations since the mid-1930s in mobilising the rural poor (sharecroppers, agricultural labourers and poor peasants) [Dasgupta 1984a, 1984b]. The 'tebhaga movement' of the 1940s and the early 1950s led to the 1950 legislation giving some protection to the sharecroppers against eviction and raising the crop-share, and to the Estate Acquisition Act and land reform legislation, both of 1953. These legislations, though not entirely doing away with landlordism, drastically curtailed the monopoly over land and reduced social and political control by the landlords. As numerous studies suggest, this helped in the transfer of power in the countryside from the hands of the parasitic, absentee, large-scale landlords to the small landlords and the upper crust of the peasantry, whose position was further reinforced by adult franchise, the setting up of co-operatives and community development blocks, and later, the spread of modern agrarian technologies. However, the peasant organisations persisted with their demand for land reform [Dasgupta 1982, 1984a, 1984b].

A major focus of political mobilisation was on food, in which along with the poor peasantry, sharecroppers, agricultural labourers and artisans, a section of the urban poor and middle class were drawn in. In the massive 'food movements' of 1952, 1958, 1959 and 1966, leading to large-scale firing and many deaths, while the peasants demanded just prices for their agricultural produce and protection against distress-selling, the others were demanding lower food prices and strengthening of the rationing system; both of these demands were expected to be met at the same time at the cost of the middlemen standing between the buyers and the sellers.

Both types of political mobilisation helped to create a political and social environment that eventually gave birth to the first non-Congress, United Front government of the left wing and democratic parties in 1967. Though this government was dismissed by the central government after eight months,

the United Front won again in 1969. The latter survived for 13 eventful months, during which, for the first time, a serious effort was made to carry out land reform. A novel feature of the programme was the call given to the poor and landless peasantry to locate ceiling-surplus 'benami' land, and the constitution of village level committees which took over and distributed such land. The enthusiastic response of the rural poor led to the identification and distribution of 3,00,000 acres of such land. More important, it gave the latter a taste of power and boosted their self-confidence, which saw them through seven difficult years, during 1970-77, when attempts were made to dislodge them from the land for which they had been given 'patta' by the Second United Front [Dasgupta 1982, 1993; Bandhopadhyay 1973, 1979; Government of West Bengal 1975; Sarkar and Prasanna 1976]. When they were again given the opportunity to vote in 1977, they helped the Left Front government to come to power, with an understanding that land reform would figure prominently in their agenda.

Undoubtedly, the two most radical and significant poverty alleviation measures of the Left Front government, during 1977-1993, have been land reform and the decentralisation of decision-making through panchayats. Today, thanks to land reform large landholdings, forcible eviction of tenants and semi-feudal extra-economic control of the rich over the labour power of

the poor are things of the past. Regular panchayat elections coupled with land reform and the curbing of land monopoly, have enabled the poorer majority to direct the location of utilities, selection of beneficiaries and distribution of public patronage towards the rural poor. Today about half the development expenditure in the state is undertaken through the panchayats, which are an indispensable and unavoidable component of any development programme. No less important is its social-psychological impact, as the village poor are becoming increasingly assertive and conscious of their own rights and sense of self-respect. As we will see below, this greater awareness is also being increasingly translated into productive economic activities, e.g., increasing agricultural production, after a time-lag [CMIE 1993]. A third major element has been an effective implementation of the centrally-sponsored poverty alleviation programmes, again mainly through the panchayats.

Unlike Andhra, Tamil Nadu or Kerala, highly subsidised rice distribution programmes were never taken up in West Bengal, nor is there anything like the employment guarantee scheme of Maharashtra or the practice of making bonus payments to agriculturists on top of the agricultural support prices, as in Punjab or Haryana. Nor has there been anything remotely comparable to the technological breakthrough in agriculture that has taken place in Haryana or Punjab, which could go

TABLE 1 POVERTY LINE - NSS ESTIMATES, 1977-78 AND 1987-88

(Units in lakh)

Area	1977-78			1987-88		
	Number	State Per Cent	Rank	Number	State Per Cent	Rank

TABLE 2: MAJOR SOCIAL INDICATORS

Indicator	1980-81			1990-91		
	West Bengal	India	Rank	West Bengal	India	Rank
Birth rate per thousand	32.5	36.9	8	27.5	30.6	5
Death rate per thousand	11.3	12.7	7	8.6	10.6	5
Infant mortality rate per thousand	91	110	6	63	80	4
Literacy rate per hundred	48.6	43.6	6	57.7	52.1	6
Female literacy per hundred	36.1	29.8	7	47.2	39.4	7
Expenditure on education per capita	45.3	46.1	10	217.9	190.4	7
Expenditure on health per capita	106		6	473		3

Note: Birth and death rate figures relate to 1979-91 and 1988-90, three-year moving averages; infant mortality figures are for 1981 and 1990; literacy rates are for 1981 and 1991; health expenditure figures are for 1980 and 1991.

Source: As in Table 1

some way towards percolating the benefits down to the rural poor. Yet, as the data from the agricultural census suggest, the tendencies towards landlessness and widening rural inequality, which are almost universal in India, have been by and large kept in leash in West Bengal [Government of India 1987].¹

II

Poverty Level and Dimensions

If one goes by the NSS poverty estimates for 1977-78 and 1987-88, one finds that West Bengal's rank, in ascending order of poverty, has improved from 11th to seventh – its relative position having improved *vis à vis* Andhra, Karnataka, Maharashtra and Uttar Pradesh. The proportion of poor has been nearly halved from 27.6 crore to 17.3 crore. The proportion of poor in West Bengal is now lower than the national average, whereas 10 years ago it was higher. Taking rural poverty separately into account, there has been a steep decline from 58.3 per cent (12th rank), which was seven points higher than the national average to 30.3 per cent (7th rank), that is 3 per cent lower than the national average. Its rank has improved at the cost of Andhra, Bihar, Karnataka, Tamil Nadu and Uttar Pradesh.

As for urban poverty, the decline in percentage terms has been less dramatic, and the figure continues to be lower than the national average. Rankwise, the state has moved from sixth to ninth, a decline – Assam, Kerala and Tamil Nadu being the states to gain at the cost of West Bengal – during these 10 years. Thus, while the level of urban poverty has declined in West Bengal, there has been a steeper decline in other states. Among the other states, the improvements registered by Assam (from 36.5 per cent to 9.4 per cent), Tamil Nadu (from 45.3 per cent to 20.5 per cent) and Kerala (from 53.2 per cent to 19.3 per cent) are highly dramatic, and it is for the academics working on these states to ascertain the reasons for such remarkable progress. The fact that poverty alleviation in West Bengal has been more spectacular in the rural areas is obviously linked with the package of policies implemented by the state government in the countryside during these 10 years.

Taking total and rural poverty levels into account, West Bengal's performance during this 10-year period has been surpassed by only two other states – Kerala and Assam. Comparing West Bengal's performance with those for the other states, we find that four states – Punjab, Haryana, Gujarat and Kerala – have performed consistently better on most development indicators, while Maharashtra and Tamil Nadu, two other states with good all round performances, are

missing from the top six. Their places have been taken by two surprise inclusions, and for not very obvious reasons – Rajasthan and Assam – states which are among the backward ones.

Here we are not dealing with the alternative measures of poverty line that have been discussed in Sheila Bhalla's paper on Haryana, which show West Bengal's performance in a poorer light. This is largely because the data for those relate to 1983, too soon after the launching of a major poverty alleviation drive by the Left Front government, when the new measures had only begun to make their impact. The 1987-88 NSS figures, in contrast with a time interval of 10 years from the previous estimates, as also from the beginning of the Left Front government, give a more relevant measure of the effectiveness of these new measures. Later studies by NSS with a similar standardised format might confirm this trend towards increasing success in poverty alleviation. Moreover, as our following account will show, West Bengal's poverty rankings in terms of NSS estimates, are consistent with those for a wide range of economic, social, agricultural and rural indicators.

SOCIAL INDICATORS

Table 2 illustrates the changes that have taken place in the state in the 1980s, in terms of some key social indicators. These show improvements in the relative position of the state in relation to birth, death and infant mortality rates, and total and female literacy rates. It also gives per capita state expenditures on health and education – which also show improvement in the relative position – as explanations for improvement in key social indicators.

Table 2 also shows that in terms of those indicators, West Bengal's position is very close to those of the leading states. In terms of death rate, its figures are bettered only by Kerala, Tripura, Maharashtra and Punjab, Tripura being the only backward state. In terms of birth rate, both Kerala and Tripura show better figures, as also Andhra and Tamil Nadu, but Maharashtra, Punjab and Haryana, among the leading states, are lagging behind West Bengal. Infant mortality figures are even better, with only Kerala, Punjab and Maharashtra all developed states holding higher ranks. In terms of literacy, Kerala, Tamil Nadu, Maharashtra, Gujarat and Tripura hold higher ranks (and Punjab,

TABLE 3 KEY ECONOMIC INDICATORS

Indicator	1980-81			1989-90

in the case of female literacy) Only Tamil Nadu among these states spends less than West Bengal on a per capita basis on education, while Assam with a lower level of literacy spends more. As for per capita expenditure on health Maharashtra and Uttar Pradesh are the only two states to spend more. Taking all these indicators together into account only Tripura among the backward states appear to perform better than West Bengal on social matters.

Further corroboration of this social improvement is provided by the statewide changes in gender ratios between 1981 and 1991. It is remarkable that only three among the major states show an increase in the ratio of women (per 1 000 men). West Bengal (from 911 to 917), Punjab (879 to 882) and Kerala (1 032 to 1 036), while the national figure declined from 935 to 927.

ECONOMIC INDICATORS

Coming to the economic indicators (Table 3) we find that West Bengal's relative position has deteriorated during the 1980s in terms of per capita net state domestic product at factor cost and constant prices. In 1980-81 only Punjab, Haryana, Maharashtra and Gujarat all leading states held superior positions, but by 1988-89 Karnataka and Tamil Nadu had moved past West Bengal. The explanation for this can be found in terms of some of the other indicators that appear in Table 3 which reveal the negative attitude of the central government towards this particular state government, more specifically in terms of allocation of plan fund, of credit from public sector banks and non bank financial institutions operating at the national level and of the number of industrial licences and letters of intent issued. The rank of the state in terms of plan allocation declined from fifth to 10th, that in terms of the credit deposit ratio of public sector banks from eighth to 11th, that in terms of non bank financial institutions from fourth to seventh, that of industrial licences from seventh to 14th, and that of letters of intent from seventh to 10th, during the 1980s, none of which can be explained or justified in terms of economic criteria alone. For a state which accounts for the third highest amount of deposits and advances, the number of bank offices per lakh population is abysmally low, and the rank is very near the bottom.

Whatever success has been achieved, either in combating social problems, as discussed above, or on the rural/agricultural front, to be discussed below, has been despite this negative attitude. In Table 3 we find that the rank of the state has improved in terms of per capita rural consumption expenditure, only Uttar Pradesh and Maharashtra show better figures in 1988-89. In terms of per

capita agricultural income, West Bengal is sixth, after Punjab, Haryana, Karnataka, Maharashtra and Rajasthan.

AGRICULTURAL AND OTHER RURAL INDICATORS

Similar progress has been recorded in terms of a wider range of agricultural variables (Table 4) in terms of foodgrain production, per capita foodgrain production and West Bengal's share in total food production. In terms of yield per hectare the progress has been quite impressive, from a middle ranking of seventh to a front ranking of fourth, after Punjab, Haryana and Tamil Nadu, surpassing Andhra Pradesh, Kerala and Uttar Pradesh during the 1980s. The proportion of rice area under HYV shows progress both in terms of coverage and rank, though the overall position is still quite low. With inputs the situation is far from uniform. Fertiliser consumption appears to be quite high by Indian standards, with only Punjab, Haryana, Tamil Nadu and Andhra consuming more. But in terms of the cumulative stock of diesel pump sets, energisation of pumpsets and tube wells, and the share of the state in the number of tractors, the relative position has remained more or less stagnant. The same is more or less true of the proportions of net and gross irrigated areas. However, there is some indication of increasing diversification, as the proportionate acreage of non food crops has increased significantly, and the corresponding rank has moved from 14th to 10th position. Taking all these indicators together, West Bengal's relative position shows improvement in the field of agriculture, but it still remains a middle ranking state in terms of performance. However, more recent data on agriculture

indicate that West Bengal's rate of growth was the highest among the Indian states during the 1980s [Census of India 1993].

Coming to other rural indicators (Table 5), again the same two observations hold: (a) that the relative position has improved, and (b) that West Bengal's overall position is that of a middle or low ranking state. Though the total participation rate and female participation rate have shown improvement, as well as the state share of female workers and sale of khadi goods and employment in khadi industries, the relative position has declined in terms of milk production and the proportion of electrified villages, the latter locating the state very near the bottom. The state excels in egg production, producing less than only Andhra and Tamil Nadu. In terms of the livestock population, West Bengal comes after Maharashtra and four of the most backward states in the country, Uttar Pradesh, Madhya Pradesh, Andhra and Bihar.

More recent data suggest that West Bengal's rate of growth of food production has been the fastest among the Indian states during 1983-84 to 1991-92 at 6.5 per cent, compared with 2.7 per cent for the country as a whole, and 4 per cent and 3.8 per cent for Punjab and Haryana, respectively. In terms of yield of rice (kgs/hectare), West Bengal's rank improved from 10th in 1976-77 to sixth in 1991-92, that is after Punjab, Haryana, Tamil Nadu, Andhra and Karnataka, having overtaken Gujarat, Kerala, Maharashtra and Rajasthan [CMIE 1993].

III Land Reforms

It is evident from Table 6 that as far as land reform is concerned, West Bengal tops

TABLE 4. KEY AGRICULTURAL INDICATORS

on practically every count. Accounting for only 2.7 per cent of the country's land area, it accounts for a much higher proportion of the land declared surplus, taken possession of and distributed.

Table 7 shows that so far about 10 lakh acres of land have been distributed to about 20 lakh landless, which works out to about a half acre per beneficiary. This amount is certainly not enough to make the beneficiary a self-sufficient agriculturist, and he would have to continue selling his labour power to augment his income from land. But that was never the objective. The objective was mainly social-psychological in nature, that is to curb land monopoly and make the poor agriculturist feel that the state is behind him. The land vested in him provides the beneficiary with a certain amount of income and social status and the ability to break through the mental barrier that makes him accept poverty and a low social ranking. To make land reform somewhat more meaningful from an economic point of view, it is necessary to provide him with access to credit, technology and information and to encourage him to join co-operatives. Most of these tasks are now accomplished through the panchayats. The recent spurt in agricultural output might be seen as one of the consequences of land reform. After a time lag to allow the change in social relations in the villages to sink into the minds of the poor peasants. However, there are indications that market forces are at work to take away the control (if not the ownership, and if not formally or legally then by way of verbal agreement) of such land in favour of the richer among the rural masses [Dasgupta 1993a].

A major feature of land reform since 1977 has been the participation of possible beneficiaries in the decisions on land distribution and in the selection of beneficiaries. The amount of land available for distribution having been exhausted, the state government-sponsored legislation in 1981 to plug the loopholes in the land ceiling laws – by way of exemptions given to orchards, plantations, fisheries and religious trusts – but it took many years for the approval of the central government to come [Government of West Bengal 1986]. Now, although the approval has come, it is quite possible that most of such land has disappeared through all kinds of fictitious transfers. In any case, distribution of such land is now a priority area of the government. In many cases, anticipating such distribution, landless peasants and sharecroppers have taken over such land and are actually in possession of it. In these cases, generally speaking, land reform would amount to giving *de jure* recognition to such possession and possibly to take back from those in possession land that is in

excess of the average for the assignees of vested land.

Another area on which the state government is at work at the moment covers those plots which, though classified as 'non-agricultural or unfit for cultivation', are actually being cultivated. Take over of such lands and their distribution would augment the supply of land for further distribution. Land areas whose distribution had been frozen by court injunction but which, having been released by the court, are now available for distribution is another area of priority concern. The state government is now preparing a detailed list of such plots. Taking all these three together, a few more lakh acres of land are expected to become available for distribution, but no more [Dasgupta 1982, Leiten 1990, 1990a, Ghosh 1980].

In other words, unless the ceiling on land ownership is further lowered, which is politically infeasible given the poor record of implementation of land ceiling laws in the country as a whole, the scope for further land distribution in this state alone is limited. At the same time, the alternative of easing the demographic pressure on land by transferring a significant proportion of manpower to towns and industries is unlikely to be achieved in the short run. Given these constraints, the government is reconciled to trying its best under the circumstances, that is, providing security to sharecroppers and landless labourers against eviction and joblessness. Such security cannot be provided by way of legislation alone since, given

that most such sharecropping or tenancy agreements are oral in nature, these cannot be proved in a court of law. The government therefore, put emphasis on recording of land rights as a precondition for the successful implementation of laws that already exist in their favour.

The popularly known 'Operation Barga' is actually a programme for hastening the process of recording land rights. It involves identification of areas with a high concentration of sharecroppers, holding of public meetings in those places where a team of officials (to ensure that they are not intimidated by the powerful few) meet the villagers collectively (again, to minimise the possibility of intimidation) and after spot verification of various claims and counter-claims, issuing of a parcha or temporary document recording the rights. The public meetings are held after wide notification by way of traditional drumbeating and other means. The sharecropper can then make use of this parcha to secure credit and other facilities. By now more than 14 lakh sharecroppers have been recorded while other measures have been taken in their favour including higher crop share, restrictions on return of land on the ground of self-cultivation, and provision of credit which have been discussed elsewhere by the author [Bandhopadhyay 1986, Dutt 1981, Ghosh and Nagraj 1978, Government of West Bengal 1981]. Registration of homesteads – now numbering 2.58 lakh – has also struck at the root of semi-feudal control over labour power.

IV Panchayati Development

Several features distinguish panchayats in West Bengal from those in other states. First, since 1978 there have been regular elections, at five-year intervals, covering three levels – zilla parishad (district), panchayat samiti (CD block) and gram (which is, on average, an aggregate of 10 villages). These elections evoke a great deal of enthusiasm and the turnout is higher than that for state assembly and parliamentary elections. Though the left wing parties take the lion's share of votes, they compete with one another in panchayat elections and in terms of control of gram panchayats, the partywise turnover is quite high. Secondly, the elections produce panchayats in which about 70 per cent of the members are from the poor strata (mainly poor peasantry) and another 25 per cent or so from the middle strata (including school teachers) while about 5 per cent come from the rich strata of the village population. The dominance of the village poor in the panchayat system has brought about a radical transformation in the correlation of various class forces in village society [Government of West Bengal 1980, Leiten 1988]. Third, about half of the total development budget of the state is spent through the panchayat at various levels, as also the amount allocated under various poverty alleviation schemes. As a consequence the beneficiaries are better targeted while planning priorities and location decisions for various facilities correspond relatively more closely to the felt needs of the rural population. Today it is virtually impossible to think of development in the village context without the panchayat being a party to it. Fourth, while there is no provision for nyaya panchayats in the state legislation, the panchayat members do play a major role in the settlement of village disputes largely because people find it cheaper and quicker and more in tune with their own culture than the impersonal and distant courts which take months to make decisions [Government of India 1985, Dasgupta 1986, 1993a, Webster 1989, Sengupta 1992, Westergaard 1986, Dasgupta 1982, Planning Commission 1978].

Panchayat-led development programmes enjoy several distinct advantages over bureaucracy-led CD type development programmes. First, they are many times more accountable, since the panchayat members live in the village, have to regularly face the electorate in periodic gram sabhas and in elections and are incapable of shunning interaction with fellow villagers, whereas the BDO would virtually disappear from the scene once he is transferred. Second, information on inflow and outflow of funds would be more widely known and would be subjected to close scrutiny by a plural political

body, which would make funding of non-existent roads and tanks that much more difficult as the transactions would no longer be concealed in file and paper work. Third, whatever they lack in terms of formal educational qualifications are more than made up for by their own stake in local level development and their intimate knowledge of the ecology and society. It should be added that, more often than not, they are highly intelligent and capable people who are widely respected and should not be underestimated because of absence of a string of degrees. Fourth, they often act as important change agents: new crops and technologies successfully introduced in their fields draw more attention than the work on official demonstration farms. They are also more capable of translating new ideas into local dialects and idioms and thus of communicating more easily with the target population. Last, whatever be their political affiliation, they operate within a system in which various sub-localities and individuals compete for scarce funds and as a consequence their location decisions or selection of beneficiaries are more likely to reflect the local consensus compared to the arbitrary selection by BDOs very often influenced by the rural rich [Dasgupta 1986].

Let us briefly indicate some of the major failings of this institution.

(a) Not enough has been done by way of mobilising local resources: the panchayats have tended to work as agents of the state and central governments rather than becoming champions of voluntary participation in community activities [Mukarji and Bandopadhyay 1993].

(b) Co-operatives, which could have emerged as the economic wing of the panchayat, have performed very badly in the state: only recently attempts are being made to expand membership and turnover and to diversify their activities.

(c) There is a pronounced tendency towards localism: the members giving priority to their own villages over the welfare of the bigger communities of which they are a part. This often leads to a crude form of egalitarianism – that is equal division of available funds among sub-areas without taking into account the external economies enjoyed by certain sub-areas, e.g. in terms of access, a more than proportionate investment in which would be beneficial to the larger entity [Dasgupta 1986].

V Centrally-Sponsored Poverty Alleviation Schemes

Almost as a rule, the major centrally sponsored poverty alleviation schemes in West Bengal are implemented through the panchayats. The latter identify the specific

schemes on the shelf which fit into their specific requirements and the 'felt needs' of the people of the concerned locality and the beneficiaries, and arrange for the money

TABLE 7. LAND REFORM – SOME RELEVANT INFORMATION

to be received, spent and accounted for. In some cases the District Rural Development Agency (DRDA) is formally in charge, but the actual task is delegated to the panchayats, and in some others the activities of various panchayats are reported to the DRDA. Whatever be the formal requirement in a particular case, for all practical purposes the panchayats are in charge. Among the panchayat bodies at various levels the zilla parishad acts as the co-ordinating and fund disbursing body for several of the schemes and in the case of some implement it directly. However, most of the funds are disbursed by panchayat samitis and the gram panchayats. Here we propose to examine some of these schemes in detail.

NREP AND JRY

From the time of the formation of the panchayats in West Bengal the food for work type of programme in which a part of the wage is paid in cash has become a major feature of their functioning and has earned them many accolades [Planning Commission 1980 Chaudhri 1980]. Unlike some of the other states here panchayats at various levels have been made solely responsible for the implementation of the programme. As Table 8 based on the 1987-88 concurrent evaluation of the National Rural Employment Programme (NREP) shows West Bengal has performed much better than the country as a whole in the implementation of this programme. This is also reflected in the reports by Indira Hirway, the mid-term appraisal of the Seventh Plan and various other documents [Planning Commission 1987 Hirway and Terhal 1990].

Table 9 on declared minimum wages shows how the minimum wages have been revised from time to time. In the concurrent evaluation of 1987-88 it is noted that the average wages paid exceeded declared minimum wages. On the whole the seasonality of the operation of this scheme has been synchronised with the periods of low demand for labourers during a year, and the activities – road construction, tank excavation, etc – have helped to create important rural social assets. However, panchayats vary from place to place in their ability to organise activities and mobilise people. The ratio of wages to total expenditure stood at 71 per cent in 1984-85, but then declined to 55, 59 and 54.25 per cent in subsequent years. This is well within the 60-40 wage-non wage break up in the guideline for JRY. Another guideline, of more than 30 per cent beneficiaries being women, has been over fulfilled, as the proportion of the latter stands at 31.19 per cent.

A major handicap in recent years has been the budgetary constraints at the state level. The overall situation is that NREP provides for about 4.64 mandays of work and RLEGP for another 3.42 days in a year for one member of a poor family. This is obviously very inadequate at a general level. On the other hand the strength of NREP lies in its operation at the margin: the fact that it exists provides the rural poor with an alternative which whether taken up or not strengthens their bargaining power and helps to influence wage levels at the grass roots, particularly during the lean season.

Several studies on the rural labour market show that the rural labourer is no longer dependent on a single patron: works for a number of possible employers, does not usually take credit from the employer, would not help out the latter in various ceremonies, etc. and certainly would not contribute voluntary family labour for those purposes any more. The relationship is now more or less impersonal and market based and in place of segmented rural markets a single wage rate now prevails in a particular locality. In bringing about this change in social and economic relationships, the land reform measures, particularly those relating to hutments and distribution of ceiling surplus land to the landless, as well as declaration of minimum wages and operation of NREP have played major roles. The social status of labourers has also been elevated as a consequence [Rudra 1982 Rudra and Bardhan 1978 Dasgupta 1982].

RLEGP

Like NREP in its various incarnations the Rural Labour Employment Guaranteed Programme (RLEGP) too is implemented in the state through the panchayats, but in this case the district level body (zilla parishad) and the district level planning body are responsible for planning. As in the case of IRDP (see below) the progress was initially slow – Rs 7.74 crore for 1983-84 came very late and hence could not be utilised while only Rs 9.45 crore out of the total allocation of Rs 23.08 crore for the following year could be utilised. The programme took off from 1985-86 and did very well for the next two years, but from 1987 the allocation on this head has declined. In recent years there has been a distinct shift in the allocation under various heads towards irrigation.

IRDP

Launched in 1978-79, in 169 blocks the entire rural area of the state was brought under the Integrated Rural Development Programme (IRDP) by 1980. This programme is formally guided by DRDA,

but for all practical purposes the execution is left in the hands of the panchayats.

Initially the progress was slow. In 1980-81 only 14.17 per cent of the target beneficiaries were covered; the figures were better in the next two years – 26.92 and 48.07 per cent – but were still quite low in relation to what was expected. The main reason was the mutual distrust of the panchayats and the banks on whose credit

(and the subsidy from the government) the programme stood. The banks were not reconciled to poor and illiterate representatives of the rural population and were not convinced that they could do business together. There was an unfounded fear that the rate of default would be higher with so many poor people taking loans. At the back of their mind they probably resented the heavier workloads that a very large number of very small accounts would inflict on them. On the side of the panchayat there was no clear understanding of the role of the bank or their concern for the viability of a scheme or of the formalities that would inevitably go with these [Dasgupta 1986].

By 1983-84 the situation had changed and the relationship between the banks and the panchayats improved which was reflected in the 117.49 per cent fulfilment of the target in terms of beneficiaries. In the following year the figure rose to 137.02 per cent and during the Seventh Plan the average worked out at 127.95 per cent while in terms of expenditure too the target was overfulfilled at 105.75 per cent. The proportion of scheduled castes and tribes among the beneficiaries worked out to 37.26 per cent, while that for women was 24.35 per cent; the latter did not reveal the trend as in the last year of the Seventh Plan the figure was 38.49 per cent.

The findings of the concurrent evaluation of 1987-88 are summarised in Table 10. These show that while in terms of felt needs, maintenance and after care of assets in generating additional income for the beneficiaries as well as in crossing over the poverty line, West Bengal has performed relatively better, surprisingly the proportion of ineligible beneficiaries is slightly higher than the national average while more of the beneficiaries are located very near or above the Rs 3,500 line.

The 1989 evaluation found that West Bengal performed better than average in terms of the proportion crossing the poverty line of Rs 3,500, maintenance and quality of assets created, inclusion of working capital in costs and the sufficiency of help; it performed relatively worse in terms of the proportion crossing the Rs 6,400 line, IRDP assistance for the Trysem trained, after-care support and increase in family income. However, the selection process is 100 per cent controlled by the gram panchayat compared with 65.41 per cent average for the country as a whole.

PROGRAMMES FOR SCHEDULED CASTES AND TRIBES

We have already noted that more than 27 per cent of West Bengal's population belong to scheduled castes and tribes, by far the largest proportion among the Indian states.

As our analysis of various programmes in West Bengal shows whether land distribution on mandays under NREP or JRY or IRDP – the proportion of beneficiaries from these categories exceed their weightage in the population.

Two major outfits operate in the state for the upliftment of these categories of the population – the Scheduled Castes Development Corporation (SCDC) and the Scheduled Castes and Scheduled Tribes Development Finance Corporation (SCSTDFC).

An evaluation of SCSTDFC undertaken by AIC found that the beneficiaries had been properly selected, 75 per cent of them regularly pay their loan instalments and loans are properly utilised in 86 per cent of cases. However, the rate of loan recovery is low at 35 per cent and administrative expenses account for Rs 86 per beneficiary [Government of West Bengal 1991].

Another evaluation by the monitoring cell of the Development and Planning Department of the state government finds that 48 per cent of the beneficiaries earn more than Rs 2,000 per year from the scheme, loan is sanctioned within one month in 25 per cent of cases and another 37 per cent within three months, while loan is received within three months in 31 per cent of cases and within six months in another 37 per cent of cases [Government of West Bengal 1991].

VI

Public Distribution System

Compared with Tamil Nadu and Andhra, the PDS is a small affair in West Bengal. There is no elaborate scheme to supply basic food at a subsidised price to the rural poor and the state budget subsidy for this purpose is quite modest by the standards of these two south Indian counterparts. Yet it plays a major role in the rural life of the state as it has been a food deficit state ever since pre-independence days. The great famine of 1943 first led to the introduction of the rationing system, which is now an integral part of the daily life of the people of the state.

The PDS contains the following major components:

(i) A statutory system of rationing in mainly urban areas of greater Calcutta, the neighbouring major districts – Howrah, Hooghly and North 24 Parganas – and the highly industrialised areas of Asansol and Durgapur on the western side.

(ii) A modified system of rationing for the other, predominantly rural, areas of the state.

(iii) A revamped distribution area from 1992 for the tribal (ITDP), drought-prone (DPAP) and designated hill (Darjeeling) areas. Those in revamped areas are given one kg of rice and 750 gms of wheat per adult per week, thus necessitating diversion

from other modified rationing areas. The introduction of this component and the priority given to it along with the fact that no compensatory amount has been supplied by the centre for this purpose, has led to a reduction in the amount available to the rationing system in the other areas of the state. Let it be added that even before 1992, tribal areas were given a special allocation, albeit on a smaller scale.

(iv) Special allocation for the tea garden areas, a legacy from the early days of tea plantation when agriculture in the neighbouring areas was not developed and migrant labourers had to be brought from other areas.

(v) A special programme for landless labourers was introduced by the state government in 1989, to provide subsidised rice (at Rs 2 25-2 50 in various years) of one kilogram per day, for a period of four weeks during lean season to agricultural labourers. Both the statutory and modified rationing systems are universal, and not specially targeted. This makes ration cards a basis for identification of persons during elections and for other purposes, but also leads to the phenomenon of 'bogus ration cards'. During 1991 a total of 4 79 558 bogus ration cards were seized.

Table 11 shows that West Bengal holds a middle ranking position among the Indian states as far as the number of fair price shops is concerned, and the relative position rather than improving as in most other cases, has slightly deteriorated since 1985. In terms of the number of fair price shops per 2 000 population, this state holds the unenviable position of being firmly placed at the very bottom.

Table 12 shows how the fair price shops are distributed among statutory, modified and revamped rationing areas. There has been little change since 1987 in terms of the balance between statutory and non-statutory areas or the number of shops.

The number of persons served in a typical week is near about one crore; the number goes up during years and months of scarcity and high food prices in the market, but declines at other times. The oil take of ration depends on the quality of the items served, as also on the season and the state of production in a particular year.

Table 13 shows that the supply of cereals has declined since 1987, the figure for 1991 being 19 per cent less than that for 1987. The supply of edible oil has suffered many times more, the 1991 figure being a small fraction of the 1987 figure. Only in the case of sugar does the supply from PDS appear not to have declined.

Tables 14 and 15 on state demand for rice and wheat and the central allotment show a significant gap between the two, and an even bigger gap between the commitment of the centre and the actual supply from the centre in a given year. For a long time the practice was for the centre to supply 1,25,000 MT of rice and 1 26 000 MT of wheat per month. In February 1988, this allotment was curtailed to 80 000 MT each of wheat and rice. In November 1992 the allotment became 73,580 MT of rice and 80 000 MT of wheat. The state government claims that such supply takes care of only about half of the PDS requirement, after deducting from estimated foodgrains production various wastage and leakages. It has been further argued that the norm of 453.6 grams per head per day, which is taken as the basis for working out the requirements of a state,

presupposes a diversified menu, which very few Indians can afford, and that 500 grams would have been a more realistic norm. The demand of the state government for 95 000 MT of rice and 1,08,000 MT of wheat is way above the current supply. It is being argued by the state government that for various reasons, for instance (a) the loss of the food surplus eastern part of Bengal at the time of partition, (b) the large inflow of refugees, and (c) the diversion of possible rice cultivation areas to jute production to earn foreign exchange for the country, the centre has a moral duty to make up for the deficits in food production.

The allotment of sugar on the basis of 500 grams per head per day in SR areas and 400 grams per head per day in MR areas norms has also been questioned, because the norm followed for Delhi and Chandigarh is based on a higher figure of 800 grams. As for edible oil, the total PDS need is for 1 80 000 MT per year, while the actual supply bears no comparison with such requirements. Recently the state government has imported 8 000 MT of palmolein for distribution with the approval of the central government. As for kerosene, the allotment of 7 25 072 MT is only 62 per cent of the requirement calculated by the state government.

Table 16 shows that in addition to the main items, a wide variety of items are supplied through ration shops, while jinnata, clothes and kerosene are also supplied through a separate set of agents.

The price at which the state government sells a particular item through PDS is usually higher by Rs 25 than the issue price charged by the central government. In revamped areas the central issue price has been reduced by Rs 50 per quintal and keeps PDS going, though the quantum is not as large as that for some of the south Indian states. The state government demands centralised procurement and distribution of 14 essential items (cereals (wheat and rice), sugar, edible oil, salt, match boxes, cheap cloth, pulses, tea, baby food, washing soap, fuel (soft coke and kerosene), cement, paper and drugs). Of these, tea, baby food and drugs have never been distributed through PDS or other channels.

In view of the high and rather unreliable dependence on the central pool for a wide range of necessities, the obvious question is whether it is possible to make West Bengal self-sufficient in those items. As our above account shows, foodgrains production has increased significantly over the past 10-15 years, but still has not kept pace with population growth. Another alternative is to procure more from within the state. As it is evident from Table 17, West Bengal has not performed well in terms of procuring foodgrains. The actual amount procured has always fallen short

of the target set for the year, and the amount procured is the lowest among the rice producing states. A part of the reason is that the market prices of paddy have generally been relatively high compared to the procurement price. Further, in view of the success with land reform, the proportion of very wealthy farmers is quite low. As a consequence, despite a 50 per cent levy on rice mill turnover, procurement has tended to be on the low side. One reason is the shortage of FCI godown capacity in Burdwan district, where most of the rice mills are located. Another is the tendency of the courts to grant injunctions to millowners against such levies whenever they apply for redress.

There is also the fear that a very strict procurement drive might push the rice supply in the state underground, and might even lead to more than usual transfers to neighbouring Bihar and Bangladesh, thus further pushing up prices within the state. Whatever be the reason, like the co-operatives, food procurement and distribution is a field where a great deal of room remains for improvement.

VII Conclusion

This case study shows that West Bengal, a very poor and a very rural state, almost as rural and as poor as the rest of east India, taking the state as a whole in 1977, has vastly improved its relative position on a broad range of economic, social and rural indicators. Land reform, panchayati development, implementation of poverty alleviation programmes through panchayats, and political mobilisation of the rural poor through kisan sabhas and political parties have been the distinguishing features of the post-1977 developments in this state as far as poverty alleviation is concerned. The institutional reforms have begun to make their mark in terms of agricultural production too. However, at an absolute level, this state continues to be poor and backward and, among others, in terms of co-operatives and PDS development. The performance of the state leaves much to be desired.

Note

1 Between 1976-77 and 1980-81, the proportion of cultivated land occupied by those with less than two hectares of land declined from 40.4 per cent to 10.3 per cent, while those with more than four hectares doubled their proportion from 33.4 to 69.4 per cent. In contrast, in West Bengal, the proportion of cultivated land of those with less than two hectares increased from 55.6 per cent to 60.4 per cent, while that of the four hectare plus category declined from 17.3 per cent to 14.4 per cent. For India as

a whole, those with less than two hectares increased their proportion from 23.5 per cent to 26.3 per cent, and those in the four hectare plus category declined from 56.5 per cent to 52.5 per cent [Government of India 1987].

CENTRE FOR SOCIAL STUDIES, SURAT

ICSSR DOCTORAL FELLOWSHIP 1995-96

The CENTRE offers ICSSR Doctoral Fellowships in the field of Political Science, Sociology, Modern History and Economics.

The fellowships are open to Indian citizens preferably below the age of 35 years (40 years for SC/ST and women scholars). In exceptional cases where a candidate is found to have outstanding ability, the age limit may be relaxed marginally at the discretion of ICSSR. Candidates applying for the award of ordinary doctoral fellowships must have cleared the National Education Test of the UGC/CSIR. The selected candidates will have to register for Ph.D. with South Gujarat University under the supervision of faculty members of the Centre. Application in the prescribed form (available till 30 November 1995 on request from the Centre) along with a research proposal should reach the Director, Centre for Social Studies, University Campus, Surat 395 007, before December 31, 1995.

Politics and Implementation of Integrated Rural Development Programme

Kuldeep Mathur

Although the eradication of rural poverty has been a recurrent theme over several decades of planning the proportion of those living below the poverty line has not declined substantially. The explanation for this apparent paradox must be sought in the political and administrative environment in which poverty alleviation programmes are formulated and implemented

I

DURING the several decades of planning the eradication of rural poverty has been a recurrent theme in the concerns of Indian policy-makers, politicians and administrators. Yet the proportion of those living below the poverty line has not declined substantially.

Explanations for such a paradoxical situation are varied and diverse. Within the liberal perspective poverty is a problem of lack of economic growth. Ahluwalia (1978) marshalled data to demonstrate that the proportion of rural poor fluctuates with agricultural performance and falls in periods of good agricultural output. As a prescription, what was necessary was to promote public policies that would accelerate agricultural growth and thus help in the 'trickle down' of benefits to the poor. The trickle down impact of growth has remained the dominant ideology of development.

On the other hand, some explanations shift away from the pure economic perspective and argue that the problems of poverty lie in the nature of class configurations which has led to the weak response of the state in matters of poverty alleviation. The capitalist model of development, promoted through the dominance of the propertied classes whose influence has not waned since the days of the nationalist movement, has not provided adequate support for policies to remove poverty. In fact the dominant class has supported the trickle down philosophy because that alone is a justification for pursuing the capitalist path of development.

In a departure from the classical mode of analysis of the domination of propertied classes, Bardhan (1984) argued that the propertied classes do not have homogeneous interests and can come into conflict with one another in pursuing their goals. He shows that in the Indian development experience these conflicts have been resolved through bargains that over time left little for capital formation and resulted in a low level of economic growth. The poor suffered as a consequence.

Kohli (1987) argued that there are regional differences in the performance of distributive policies. This diversity has arisen because of varying regime characteristics in the states. Leadership, ideology and organisational influence the way such programmes are implemented. He suggests that only

organised left of centre regimes are capable of facilitating reforms of a distributive nature within India's seriously constrained political economy.

These explanations of the weak performance of the Indian state on the poverty front are useful to understand the broad contours of the national political will with regard to the issue of poverty alleviation in the country. But the impact of such programmes also depends to a great extent on how well they are implemented. The strategies of implementation are crucial to the success of a programme. These strategies are formulated within the constitutional and administrative environment. At the macro level the features of the environment may be easily discernible but they vary at the operational level. It is this difference that allows states to show their ingenuity in striving for success if they have the necessary political will.

Our focus of attention in this paper is on the programmes specially designed for alleviating rural poverty. These programmes became part of the strategy of direct attack on poverty and were initiated during the Fourth Plan. The first of such programmes were embodied in the Small Farmer Development Agency (SFDA) and Marginal Farmers and Agricultural Labourers Agency (MFALA) established in 1970-71. Both of these agencies were merged into one as the SFDA at the beginning of the Fifth Plan in 1975. Initially 46 SFADs and 41 MFALA agencies were started. In 1979 there were 168 SFADs run in 198 districts of the country. Subsequently in 1978-79 the Integrated Rural Development Programme (IRDP) replaced the SFDA programme in some selected blocks and by 1980 was extended to all the districts in the country. Under the Small Farmer Development Programme during the period 1971-77 around 6.5 million rural households were benefited. The total budgetary outlay was Rs 134.31 crore and additional credit of Rs 243 crore was released [see Raj Krishna (1979) for a review]. In the IRDP a national target of helping 600 families per block in each year of the plan was proposed. This aggregated to 15.13 million families for the Sixth Plan and a similar number for the Seventh Plan period. An outlay of Rs 1,500 crore in the Sixth Plan to be shared equally between the centre and the states, and Rs 1,186 crore by way of central assistance,

was provided in the Seventh Plan. Never in a country's history has such an impressive single poverty alleviation programme been initiated. Several other programmes related to area development and employment generation were also initiated but we shall focus our attention in this paper on the SFDA/IRD programme and examine issues connected with its implementation.

II

The development experience of about 15 years - 1951-52 to 1966-67 - brought into serious doubt the assumptions of the planners that strategies of growth and productivity in themselves would suffice to resolve the problems of rural poverty. The efforts to promulgate land ceilings and give land to the tillers had by and large failed. Rural tensions and violence were arising in some parts of the country and the reality of the kind of problems that policies of growth unconnected with distributive justice could generate began to be realised. The All India Credit Review Committee of the Reserve Bank of India (1969) rang the alarm bells when it said, "if the fruits of development continue to be denied to large sections of the rural community while prosperity accrues to some, the resulting tensions, social and economic, may not only upset the orderly and peaceful change in the rural economy but even frustrate the national effort to step up agricultural production."

A new perspective which advocated that growth and poverty alleviation could not be seen as distinct goals and that the latter should be built into the growth processes, began to crystallise. But in this new perspective strategies to correct structural imbalances that lead to poverty were not included. Land reforms did not find a prominent place. The international aid-giving agencies had also at this time begun to express dissatisfaction with a purely economic approach to distributive justice and were proposing direct attempts to benefit the rural poor through administrative packages [see Brara (1983) especially Chapter V].

The new perspective found wide acceptance in the country due to the 'favourable' political climate that prevailed during the late 1960s. Nehru had died, India had gone to war with Pakistan in 1965-66; and Nehru's successor, Lal Bahadur Shastri,

who also died after holding the office of prime minister for less than two years, was unable to initiate the Fourth Plan due to the economic crisis. The extensive food shortage because of drought, and low productivity, had taken their toll. The era of Indira Gandhi began with the devaluation of the rupee which was a widely unpopular measure. At the same time many states had gone out of the control of the Congress, and coalitions of land-based elites had taken over state governments. In such a situation the political will to implement measures like land reforms could not be expected. However, poverty could also not be taken out of the political agenda. Therefore programmes that sought to bring direct benefits to the rural poor through redirection of some investment were seen not only as instruments to contain rural unrest but also as a way to fulfil the demands of social change and distributive justice. This has been described as the fundamental paradox of India's political economy: the commitment to radical social change and yet an equal determination to avoid a direct attack on the existing structures [Frankel 1978:3-78].

Another change also began to be discerned at the central level. The occupational pattern of the members of the lok sabha began to shift towards the agriculturists, who began to emerge as the largest single group in parliament. Those who had entered national politics when India became independent were tutored into principles of social change and were predominantly lawyers by profession. This began to change and at the time of the Fourth and Fifth Plan – 1969-70 to 1975-76 – agriculturists had become the single largest group in the lok sabha (see the table). This trend has continued.

These agriculturists were the richer farmers who were taking advantage of the new agricultural strategy based on technology and pricing policies and becoming economic entrepreneurs who were the harbingers of food self-sufficiency. They were trying to enter the political arena to direct policies to their own benefit. As one can see from the table, when the Fourth Plan began with direct intervention and the Fifth Plan formalised specific programmes, the lok sabha had around one-third of its members with an agricultural occupation. State leaderships were already getting more and more agriculture based and had begun making demands on the centre for a greater role in matters that affected them. Panchayati raj which had introduced democratisation at the district level and below, was stagnating because elections to these institutions were not held in the 1960s. One expectation of elections is that it provides a turnover of leadership which helps in the redistribution of power among various social groups. But when elections are not held, those elected face no threat and work only to consolidate their power. In the initial elections, panchayati raj provided a secular method of elections to the landowning classes to

legitimise their hold on village social structure. Elected leaders based their power on land and they knew that land reforms would mean a drastic reduction in the power they wielded. They used their influence to forge links with state leaders, who began to become more and more dependent on them for votes. Consolidation of 'vote banks' was also consolidation of the power of the landowning classes. Thus, on the one hand, they were careful to thwart any effort to implement land ceilings, but on the other they were happy to welcome special schemes to alleviate poverty.

III

The new perspective on rural development began the era of special schemes, displacing the comprehensive programme of rural upliftment through community development introduced in the First Plan. The latter was allowed to wither away when the Fourth Plan introduced special measures to help small farmers, marginal farmers and agricultural labourers. This marked the beginning of a period when comprehensive programmes began to give way to a segmental view of rural development. Each aspect of rural life from agriculture to health, housing or education began to be looked at in a fragmented fashion. Each segment attracted a special programme not necessarily linked with the others. The Fourth Plan can also be seen as emphasising a new focus on poverty studies. There had been some discussion, undoubtedly, on the skewed income distribution in the country, and in the late 1950s a question like, 'Where have all the benefits of development gone?', was raised in parliament. The government of India did set up a high powered committee to investigate, but no satisfactory answer was forthcoming. Douglas Ensminger, during the last of his 17 years as Ford Foundation representative in India, commissioned 12 studies on problems he believed were crucial to India in the coming decade. One of the studies was on poverty, conducted by Dandekar and Rath (1971). This study was a precursor to the numerous studies that have followed ever since and a source for sensitising intellectuals and the political leadership to the emerging problems.

Finally, acceptance of the special schemes during the Fourth Plan projected the consensus that was emerging between the techno-economic view of development and

the constraints of the emerging political environment. The special schemes as appendages to the national development strategy of growth were readily accepted because they did not in any way interfere with the grandiose designs of development that continued to rely on the best and the strong. The landed interests apparently felt relieved of the pressure put on them through policies of asset redistribution, and no threatened as they were before.

The political economic situation preceding the Fourth Plan has an important bearing on the way the special schemes were conceptualised. I consider it important that they were so readily accepted. Politically, they provided visible methods of working for the rural poor and thus could pay political dividends (a major part of Mrs Gandhi's constituency was the rural poor, SCs and STs). Economically they were acceptable because they did not hamper the pursuit of policies of growth. Removing poverty though high on the political agenda, was not the core theme around which development strategy was conceived, and initiating such programmes allowed it to remain so. Thus poverty alleviation schemes did not threaten either the strategy of development nor the structural relationships in society. Political acceptance of these schemes appears to be because of their innocuous nature and not due to an expectation that they would create a more equal society.

Within this zone of acceptability delineated above, it must also be remembered that these special schemes in the Fourth Plan came as an initiative from the central government. Even though agriculture and rural development are on the state list, the centre has assumed leadership in this area; the Community Development Programme introduced in 1952 was a centrally sponsored programme. Central sponsorship lay in the design of the programme, its monitoring, and provision of funds for its implementation.

Over the years the centre has intervened increasingly with what have come to be known as centrally sponsored schemes. In the constitution, subjects related to agriculture and rural development have been placed in the state list. Matters that concern more than one state or are considered to be of national importance, are placed in the concurrent list. The reason for a central role in state subjects is the responsibility of the

TABLE: DISTRIBUTION OF MEMBERS OF LOK SABHA BY PROFESSION

1984-89	38.30	19.05	16.03	530

centre for social and economic planning. It has used the mechanism of a centrally sponsored scheme to initiate programmes in the rural sector. "These schemes subserve the objectives of providing basic social infrastructure which will lead to an improvement in the quality of life of the people in the rural areas" [Government of India 1988:442]. But of late these schemes have come to cover virtually every field of activity, and poverty alleviation programmes are also covered by it. There were 92 such schemes in the Third Plan, out of which 32 fell in the agricultural sector. The number had increased to 146 in the Sixth Plan and to 238 during the Seventh Plan. In the agricultural sector, the number had increased to 65 with an outlay of Rs. 2771.66 crore, [Government of India 1988:448-450]. Some of these schemes are totally funded by the centre; others are shared equally between the centre and the states.

There are at least two reasons for the centre to play an active role in the area of rural development over which states have jurisdiction. One is that the states are reluctant to formulate specific programmes and initiate policies because they lack the expertise or funds or both. Central intervention can fill the need. The other may be that the states are hesitant because the necessary political will does not exist. Removed from local politics the centre comes in to play a leadership role. On both these counts the states present a varied picture.

Some states have alleged that these programmes impose an extra burden on them without their involvement in designing them. The SFDA was fully funded by the centre, but the financing of the IRDP is shared equally between the centre and the states while the major responsibility for overall design continues to lie with the centre. What is significant is that sometimes these schemes curb state initiatives in the area of poverty alleviation. Rajasthan began its Antyodaya programme in 1978-79 when IRDP was being spread throughout the country. In Karnataka the state government started the Bhagyajyothi scheme under which one free light was given to an SC household in every village. The central government introduced Kuteer Jyothi in 1989-90 which is nothing but a copy of the Karnataka scheme. There are innumerable instances of such duplication [Thimaiah 1991].

The interest of the states is sustained through the promise of central funding, but this funding is tied to the IRDP and does not allow the states to use it for a programme designed by it even with a focus on poverty alleviation. Another problem is that when the programme ends and central funding is withdrawn, the states are saddled with the programme. The result is that states are wary of providing staff and infrastructural facilities, which can become an extra financial burden later on. The positions specified in the project design are rarely filled up, and when they are filled up they suffer from the

transience of the constantly moving state bureaucracy. Another difficulty is that being centrally sponsored, IRDP carries guidelines and design principles that are not necessarily reflective of diverse local situations prevalent in the country. As a centrally sponsored scheme, little flexibility is available to the states and regions [Thimaiah 1991].

This difficulty is compounded by the fact that local level planning has not yet taken root. Successive plans have emphasised the importance of local planning in the entire planning process. The thinking has been that the bulk of investment in agriculture, minor irrigation, animal husbandry, fishing, forestry, etc. and housing, health, education, etc. could be integrated to form a local plan. This will lead to more focussed attention on the development of the local area. But the local plan continues to be a rather disjointed exercise of implementing diverse schemes through a multiplicity of departments.

There are a plethora of development schemes being implemented at the block level, and in fact the total amount now being made available annually for rural development through financial institutions and the central and state government has been estimated at over Rs. 7000 crores. This works out to about Rs. 1.5 crores per block, obviously a substantial sum considering that on average a block has only about 20,000 households [Ray 1985:150]. There is little linkage of IRDP activities with other

investments taking place in the area. All anti-poverty programmes are not integrated, and IRDP has become an individual programme carrying its own planning and implementation machinery. Interestingly, at the central level the demarcation is complete at the joint-secretary level there is one each for IRDP, NREP and DPAP who come together to sort out problems of co-ordination but not of planning. The Eighth Plan [Government of India 1992] continues to recognise the "need for integrating the various anti-poverty programmes with the sectoral programmes in a specified area" as other previous plans have done.

Setting up different agencies for separate but related tasks has led Indian administrative agencies to build protective walls around themselves, guarding jealously their programmes, their rules and their funding. However, IRDP was designed to be implemented by an agency that could be isolated from the general administrative environment. The Small Farmers Development Agency, which was the model for the District Rural Development Agency (DRDA) that was formed to implement IRDP, was established as a semi-autonomous institution at the district level. The considerations that appeared to have weighed with the government at that time were three: (a) to enable the central government to transfer funds directly to district agencies without routing these through state governments. This was to obviate the

INVITATION TO AUTHORS AND EDITORS

We are pleased to announce the establishment of the "Spell Bound Publications Pvt. Ltd," at Rohtak – a city situated in the National Capital Region of India – about 50 miles from New Delhi.

The Spell Bound Publications has a target to emerge as one of the world's premiere social science publishers. The reference programme we are launching this year will provide a major service to the whole social science community. This is reflected in the launching of the publications primarily in the following areas:

Business Economics	Environment	Politics
Business Management	Gender Studies	Psychology
Commerce	Geography	Public Administration
Development Studies	History	Rural Development
Economics	Law	Sociology
Education	Philosophy	

Ranging from student texts to monographs, our publications would combine specialist knowledge & expert opinion in areas of study which increasingly demand the world's attention. Throughout our ultimate aim would be to publish exciting & innovative work for the students, researchers & practitioners.

Authors/Editors are invited to write to us.

Spell Bound Publications Pvt. Ltd.

Post Box - 91
Rohtak-124 001 (INDIA)

necessity for obtaining financial sanctions within the state governments as these were known to cause delays
(b) to create the agencies to retain the funds after the end of the financial year and not surrender them to the state government
(c) to create agencies at the district level which were directly answerable to the central government and were also insulated from local political pressures

IV

When IRDP was introduced the government of India directed each of the SFDA's to pass a resolution to rename themselves as DRDA's. All other characteristics of the structure remains the same. Two changes, however, did occur. The only source of funds was not the government of India alone. The state government equally shared the burden and transferred their share directly to the agencies. The transfer of funds was not governed by the normal rules of the financial year and the fund did not lapse with its end. In another change, the number of professional staff was increased. Apart from the project officer and a district planning officer, there were also assistant project officers for agriculture, animal husbandry, and co-operation. Little additional staff was sanctioned at the block level or below. The government of India advised the state governments that these agencies will only serve as catalysts activating the existing government agencies to come to the help of weaker sections of the community in a big way, and that the extension staff of the various development departments of the state should attend to the work of the agency as part of their normal duties [Government of India 1980:215].

This philosophy underlying administrative arrangements continued to be emphasised when it was suggested initially very early on that

our idea is that IRDP should not be a programme in the narrow sense of the term. It should be all comprehensive which should bring in its fold all the existing organisations and therefore no department as such has been created. Deliberately, there is no idea or intention to have a department of IRDP or a single line hierarchical command all along the line down to the lowest level or below. That is why we were not in favour of the suggestion of having an independent cell (at the block level) because that will alienate the field functionaries, the VLW, BDO and various other functionaries [Government of India 1980:68].

Though a separate agency was created it became dependent on the state administrative system for its performance. The district collector was nominated as the chairman of the DRDA, the professional staff came on deputation from regular departments, and the governing council carried all the officers involved in the rural development of the district. The project staff then looks to its own parent department for career prospects

and the performance in IRDP rarely enters into such considerations. If appointments in DRDA are part of routine postings and one among many little effort is made either to create a team or imbibe expertise that comes from knowledge of the area and the people. A study conducted in a district in Rajasthan [Mathur 1985] shows that the average tenure of a project director was 18 months. The longest stay of a project director was of 48 months, but during this period three changes in the office of the district collector, two in that of APO (agriculture), two in that of APO (animal husbandry) and five in that of APO (co-operatives) took place.

The tendency of the larger administrative system to impose its own characteristics on even those administrative institutions that are sought to be established outside it is pervasive.

Targets are set by the planners of the programme at the central level and fulfilment of the targets tends to be equated with the success and effectiveness of the programme. What is success? Target number of beneficiaries receiving loans and subsidies? Or getting possession of actual assets? Or the actual number of beneficiaries crossing the poverty line? Not only are the targets taken to mean different things, but enforcing them to monitor performance leads to many detrimental consequences. The Administrative Reforms Commission (1967) in its report on agriculture administration elaborated the impact of target setting even further when it said 'performance is geared to inspections, inspections are based on targets and targets are related to financial provisions.' Another baneful effect of target is in the area of performance. Individual administrators can blame other agencies for not fulfilling their part of the bargain and this can provide an alibi for not fulfilling targets. High milk yielding cattle, which can help augment the income of beneficiaries, cannot be distributed because they have not been provided by the cattle farms. But it does not matter if cattle of low yield, which cannot help generate additional income, are provided for at least the target is fulfilled. This is all done not only because the administrators become part of a network in which non-existing or non-descript cattle can be bought and sold, but also because the urgency of meeting targets makes them do so.

The areas that do not have the necessary infrastructural facilities, but where nationally determined targets have to be implemented suffer the most. Rath (1985) quotes a NABARD study which says that except in Punjab, Haryana, U.P. and Gujarat, the milk cattle supplied were of poor quality and poor yielders but had to be delivered to the beneficiaries because nationally set targets had to be fulfilled. The difficulty was that animals of better breed and quality were not available in such large numbers.

One other area in which the characteristics of the macro-system influence the implementation of IRDP is the overall

framework of a centralised planning system. The concern for decentralised planning has found expression in several reports of the government and has led to a recognition that a local implementation system would improve considerably if development schemes reflected local reality rather than the needs of central planners. But the planning exercise at the local level continues to be confined to compilation of schemes in specified sectors according to the guidelines issued from above. The implementability of a scheme is decided on administrative and/or political grounds, which can enable reporting back achievements of financial or physical targets. Without ascribing any motivations, the local administrator is constrained because without planning skills assessment of economic viability of schemes is not undertaken and location decisions are done on an ad hoc basis, partly because little systematic information on the distribution of local facilities is available.

In a recent comparative study of IRDP in West Bengal and Tamil Nadu Swaminathan (1990) points out that 'a common factor underlying the failure of specific schemes in both regions is the absence of serious and imaginative local level planning'. The argument is that the failures derive from mismatches: (a) between the structure of assets (and final output) created by the programme and the pattern of demand (macro-mismatch); (b) between the nature of demand for assets generated by the programme and the potential supply of assets; (c) between the type of assets and pre-existing resources of a beneficiary household (micro mismatch). Thus imbalances are created, wasteful investments

are made, and beneficiaries are unable to take advantage of the assets acquired through loan and subsidy.

The concern to decentralise planning and develop district plans which would take care of the inter-linkages among sectors and ensure efficient use of local resources has been reiterated in many official documents and for many years. The Planning Commission issued guidelines for district planning in 1969. It not only emphasised the need to formulate local level plans but also linked this with the need to give sufficient freedom to the states to determine their own developmental priorities. It went on to say that the whole approach of directing development efforts in the states through centrally-assisted 'approved schemes' has to be given up. It is felt that the tying of central assistance with such schemes has led in the past not only to the distortion of states' priorities but also to a tendency to apply these schemes everywhere without due regard to the variety of conditions existing within states. [Government of India 1969:2].

During the Janata interlude of 1977-79, the Planning Commission appointed a working group under the chairmanship of M L Dantwala to initiate block-level planning in the country [Government of India 1978]. The group, while emphasising that there has been little systematic planning at the local level, suggested that the block be the unit of planning but recommended that the planning team should be located at the district level to ensure integration of the block plans with the district plan. A detailed exercise was further undertaken by the Planning Commission when it appointed a working group under the chairmanship of one of its members, C H H Rao. This group, while making recommendations also presented a 20-year plan wherein steps can be taken progressively so that sudden change, breeding resistance, could be avoided [Government of India 1984]. There have been two other committees [Government of India 1982, 1985] which were specifically concerned with the implementation of poverty alleviation programmes and which came to similar conclusions, emphasising the need to initiate local level planning. The importance attached to the practice of local level planning can be gauged from the fact that the Economic Advisory Council made it a subject of its second report submitted to the prime minister in 1984. It said that

even schemes explicitly meant to promote decentralisation and an integrated approach to development at the block level such as IRDP are in practice designed at the state capital in a manner by individual departments that precludes in effect both decentralisation and integrated development. What passes now for decentralised agricultural and rural development is, therefore, primarily distribution of funds through governmental agencies and financial institutions...

The council not only suggested ways to decentralise at the local level but also stressed the role of voluntary agencies and people's participation in any effort of this kind.

What is ironic is that field studies reporting in 1989 or 1990 [e.g. Dreze 1990; Hargopal and Ramalu 1989; Swaminathan 1990] continue to demonstrate that little local planning exists, and what passes as a district plan is not a document that identifies viable schemes in the context of a comprehensive view of existing resources and markets, or that provides for infrastructure to support projects with potential, but which rather apportions financial and physical targets accordingly [Sinha 1986]. The district plan continues to be a haphazard collection of schemes.

Another set of issues that are of central concern here are related to organisational design and the administrative system. The committees cited above have given their own suggestions of ways to improve the system of implementation. A specific committee was appointed in 1985 to look into the administrative arrangements for implementing poverty alleviation programmes [Government of India 1985]. While reiterating the need for district planning, the committee recommended a model administrative setup at the district level which attempts to incorporate people's participatory institutions. Separately, the need to strengthen the role of panchayati raj and that of voluntary agencies was also expressed. At the beginning of the Sixth Plan another committee had highlighted similar concerns [Government of India 1982].

As if unaware of all these concerns, central organisations continue to work on the mistaken assumption that uniformity and standard programming contribute to programme effectiveness and administrative efficiency. The government is reluctant to decentralise planning and the administrative system despite the recommendations of its own numerous committees urging it to do so. These committees have consisted of members who are distinguished civil servants and professionals. The chairmen are a galaxy of eminent names in agricultural and rural development: M S Swaminathan, C H H Rao, G V K Rao and M L Dantwala. By no stretch of the imagination can the honesty of their advice be disputed. The government is also reluctant to improve upon its civil service staff that is supposed to bring a revolutionary change in the countryside. The local staff have little training or incentive to perform better. Investment in administrative overheads continues unabated at central and state capitals but fails to percolate down to the district and lower levels. Anyone aware of the working conditions in rural areas cannot fail to be struck by the acute deprivation of facilities in the local level administrative apparatus.

V

The question is why the failings have persisted when they have been pointed out in official and academic writings since at least the beginning of the Fifth Plan in 1975-76. It is not as if administrative innovation has not taken place. After all, SFDA was established as a semi-autonomous agency at the district level. Why was it allowed to be absorbed into the normal administrative processes from which it was sought to be kept away? There are also improved rules, regulations, promotional opportunities and even training facilities. Why do they all tend to be confined to levels much above the local level?

It must be noted that administrative reform activity has usually been left as the responsibility of the administrators themselves. In their perception, the administrative system has stood the test of time and therefore they feel little enthusiasm to bring about far-reaching changes in it. Change is also not welcome for another reason. It may disrupt the spheres of power and authority that have been built up over the years. If strengthening the panchayati raj system poses a threat to the local administrative and political leadership, then decentralisation of planning reduces the influence of the central planner. In this scenario local administration is merely a good whipping boy – an errant child – a ready alibi for failures occurring elsewhere. For all one knows, an inept local administration is necessary to prop up the 'fair' image of central planners and administrators.

The nature of the federal system, however, is such that there are some redeeming features. It can and does allow the states to give expression to their commitment to poverty eradication. At the general level, Kohli (1987), comparing the efforts of three states – West Bengal, Karnataka and Uttar Pradesh – in improving the lot of the poor has rated West Bengal higher than the other two. He has suggested four features of the regime in power to explain the existence of political capacity to initiate effective action in this regard. These primarily relate to the nature, coherence and stability of the rule of the CPM in West Bengal. This political party has attempted to penetrate local level decision-making by strengthening panchayati raj institutions, by getting them to implement beneficiary-oriented programmes, and by holding regular elections and putting up candidates who belong to the deprived classes [Leiten 1988; Roy 1983]. There is also evidence that party commitment to the programmes of registration of sharecroppers also contributed in a considerable measure to its success [Bandopadhyay 1981]. In the specific case of the implementation of IRDP in West Bengal, Dreze (1990), after pointing out that beneficiaries include more of the rural poor, suggests that "the fact that the CPM is largely in control of

the allocation of IRDP loans in villages and that the disadvantaged sections of the population are the main constituency of the CPM are the key factors in understanding the functioning of IRDP in West Bengal". In a comparative study of West Bengal and Tamil Nadu, Swaminathan (1990) also comes to a similar conclusion.

But this political commitment is limited to the choice of beneficiaries and disbursement of loans and subsidies to the appropriate targets. It has not necessarily meant that it has led to the alleviation of poverty, for the mismatch of schemes is as pervasive in West Bengal as in Tamil Nadu [Dreze 1990; Swaminathan 1990]. However, Rajasthan can be cited as an example of a benevolent bureaucracy attempting to take over the efforts at poverty alleviation. It was among the few states that set up a state level department, that of special schemes organisations headed by a secretary, to administer all schemes like SFDA, TRDP, DPAP, etc. The bureaucracy also showed considerable foresight in introducing the antyoda programme in 1979. Many of the principles of that programme were incorporated into the IRDP introduced a year later. But where the bureaucracy foundered was at the local implementation level.

The bureaucratic system appears to work at two levels. One is at the level of preparation and design of institutionalising a professional administrative system. At this stage, committees with well meaning and experienced administrators come up with model organisations and systems that are very attractive. At another level, these organisations and personnel become part of the nexus of local politics and are unable to perform as intended. The personnel are untrained and unskilled and plod through their assignments. The very same group which would like to see increased professionalisation, when sitting on other committees does not provide adequate support for the activity proposed earlier. In this sense, policy making and implementation are truly fractured and schizophrenic. There is possibly another reason for this. The central government likes to project a progressive image-bureaucrats would like to be seen as effective planners of forward looking schemes that can bring them credit in the eyes of international funding agencies or the community of intellectuals. Failures in performance can always be blamed on local level implementation and the inability of local bureaucrats to rise above the corrupting influence of local politics.

Thus unwillingness to 'dirty one's hands', so to say, can be traced back to the characteristics of the 'zone of acceptability' to which I pointed earlier. Direct actions to remove poverty become only appendages to the dominant strategy of development; and as long as they are so, the implementation

concerns will be what they are. In contrast, when the intensive agricultural development programme which led to the 'green revolution' was being implemented, the districts chosen were placed in charge of a senior administrator such as deputy director (agriculture) with innumerable technical officers [Mathur 1982]. Farmers' demands for increased and measured supplies of inputs were met and extension networks were beefed up. A clear cut goal oriented programme with an inbuilt system of incentives for the beneficiaries is created when it is needed to serve the interests of a particular strategy of development. IRDP finds poor planning and implementation support because it is outside the dominant perspective. It is allowed to flounder, and innumerable alibis are sea-ched for to explain its failures. So, all programmes in India do not suffer from the same administrative or planning maladies.

If IRDP is not to be a 'delusion', political support to effect change in the implementation system has to be strong. Even in West Bengal, the political support has been limited to the plugging of leakages in selection of beneficiaries; this is an important first step but does not take the programme to the goals it strives for. The solution has to be sought not only in improving the bureaucratic system but in searching for an alternative to it. This can only be done when greater flexibility is provided at various levels of planning and implementation. Experience has shown that variation among states and districts is possible and should be encouraged. Looking for alternatives and using them can also achieve the objectives of increased participation and 'empowerment' of the poor in tasks of national development.

MINIMUM DEPOSIT: Rs.10,000

Beyond the minimum amount, you can deposit in multiples of Rs.1,000. The base interest rate for

a three year deposit is 12.5%. And a deposit period of five years and more fetches a base rate of 13%. What's more this

deposit comes with the guarantee of India's premier development bank IDBI. Reflected in the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally an organisation that has total assets of over Rs.36,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

This opportunity is open to: * Resident Individuals * Hindu Undivided Families * Partnership Firms * Companies/Societies Corporate/Societies * Trusts/ Association of Persons.

October 28, 1995

Oppressive Gaze

The female body is viewed as no more than a 'body-for-others', culturally constructed through media images and through women's internalisation of the gaze of the other. Thus what women often experience as oppression is related to the denigration of a body-image and sexual identity. A study of the relationship between women's experience of physical violence and psychological oppression in the home and their perceptions of their bodies and sexuality.

WS-72

New Ideals for Old

The complex relationship, and shifts in it, among women, religion and the state in pre-colonial and colonial south India in the context of the movement for the abolition of the devadasi institution enables us to see the 'victims' and their marginalisation in a new light.

WS-59

Technology Priorities

Though technology upgradation is a vital component of economic reform and is necessary to enhance international competitiveness, the pattern of technology funding does not reflect the priorities inferred from economic development and growth objectives.

2739

Common Adversary

The ongoing debate about the justification, planning and management of India's wildlife-protected areas between wildlife conservationists and human rights advocates overlooks the fact that both wildlife and local communities are equally threatened and have a common adversary in elitist state policies and the urban-industrial development process

2755

Building Bridges

Emphasising individual identities and differences among First and Third World women does not help women's emancipation in either world; it is necessary instead to look for linkages between different groups of women without undermining their specific histories. Sheila Rowbotham's writings should be read in the context of this need to create international links.

WS-50

Women's Land Rights

After the abandonment of collective farming in 1989, women and men secured equal titles to land in Cambodia. But with contradictory and unclear legislation and few checks and balances, the number of land disputes has increased sharply. The effect of this development on women's social position and gender relations.

WS-87

National Income

The new UN System of National Accounts, finalised after several years of deliberation, is predicated upon a particular economic system. It needs to be carefully modified by each country to suit its own institutional framework of economic activity.

2749

Fertility and Frailty

Evidence on the relative contributions of fertility decline and status improvement to trends in maternal mortality in India suggests that advancement in women's demographic attainment may not necessarily involve improvement in their health and social status.

WS-81

Dependency Game

A salient feature of the emerging education policy is the belief that the new money available for primary education is a sign of change of heart among the wealthy and represents a rare opportunity for us to break the cycle of poverty, child labour, lack of education and poor productivity.

2719

UN at 50

Most countries are placing increasing reliance both for security and development on regional organisations and mechanisms. So unless the UN is able to restructure itself as a confederal body linked to regional organisations as programming and operational arms it is unlikely to have much of a future.

2731

Gobinda Mukhoty

HE was arguing in court to protect the lives of people living close to an army firing range in Hoshangabad. He was preparing arguments in another case to protect people's right to public interest litigation, a right he was instrumental in giving meaning to. He was still expectantly waiting for a case challenging the constitutional validity of the Armed Forces (Special Powers) Act to be heard by court, a case which he had filed as president of PUDDR in 1982. All this while a nagging pain in the back was bothering him. And this had been so for over four years. In May this year it was discovered that this was no ordinary backache. It turned out to be a cancer. In a brief four months the cancer took its toll. After a week in coma, he died on September 19, 1995.

Thus ended a life which began in Faridpur district of undivided Bengal in 1927. Gobinda Mukhoty completed graduation from Presidency College, Calcutta, in 1948. In 1957 he went to UK to study law. After completing his bar-at-law in 1964 he returned to India and started teaching at St Xavier's College, Calcutta. He started practice as a lawyer at the Supreme Court in 1971 and was designated senior advocate in 1984.

In 1976, during the Emergency he was actively associated with the newly formed People's Union for Civil Liberties and Democratic Rights. The next year he was elected president of the Delhi unit. He was founder-member of PUDDR and its president till 1990. From then on he had been advisor to the organisation.

Mukhoty's legal acumen and professional expertise were lent time and again to the cause of the civil rights movement. In fact, it was his clear understanding of the role of law in people's struggles that enabled him to create a space whereby those who had no access to the courts of law could assert basic constitutional rights. He played a pivotal role in establishing public interest litigation as an instrument on behalf of struggling people. Quietly and surely he consolidated these gains over the past 14 years, taking up innumerable such cases, arguing them passionately, and personally bearing the cost of many of them. For PUDDR alone he handled over 40 cases covering a wide range of issues, large and small. Whether it was to challenge the validity of the Disturbed Areas Act in Andhra Pradesh, to demand justice for a custody death victim in Delhi, to fight for the right to information

of activists in Bhopal, or for freedom of bonded labourers in Haryana, Mukhoty gave of his energy and time without a thought to the cost to himself. Even as he made his brilliant legal mind available to those most in need of it, he carried the struggles and dreams of the civil rights movement into his everyday work, achieving a cohesion that in these cynical times has become near impossible.

We mourn, for what is gone is part of the best in our bedeviled country. Best, because he gave to the struggles of the people his intellectual and professional skills unstintingly.

We remember him, for he was an active maker of the civil rights movement for the past two decades. Through efforts such as his, the movement though small, has today become a distinctive presence.

His ever welcoming smile, his deep concern for the organisation and professional morality that he represented will remain a cherished memory for his 'boys and girls' in PUDDR.

PEOPLE'S UNION
FOR DEMOCRATIC RIGHTS

Delhi

In Support for Basel Ban

AS concerned citizens, citizen's groups and NGOs, we support the call for a complete ban on international waste trade, and urge the government of India to uphold the Basel ban on trade in hazardous waste from OECD to Non-OECD.

India has, until now, consistently taken a position against waste trade and is signatory to the ban. It is imperative that this position continues. Such trade will affect us adversely and we demand that details of all current and pending waste import licence information be made public.

There have been several obvious moves made by various OECD countries to subvert the ban. The industrialised countries must not be allowed to arm twist their way to further hazardous waste generation and use us as a dumping ground for their waste. The current movement of waste to Asian countries is in itself indicative of the politics of the international waste trade.

Such wastes end up in several recycling facilities both in the organised and the unorganised sectors. These often operate with little consideration for the safety and health of the labour force and the nearby residents, besides having poor implementation of pollution control laws. All the waste imported is not recycled: some of the most toxic waste is unsuitable for reprocessing and is dumped, severely damaging the environment.

Wastes should be tackled in the country of production, not sent to distant shores. We demand that the Indian government refuse to allow the country to be treated as a dump site and that it ratify the Basel ban.

Without a Policy

THE rapid and large depreciation of the rupee almost continuously during the past month and a half is a warning of the dangers of the government's free market policies when economic fundamentals are not ripe for them. The rather remarkable stability of the exchange rate at Rs 31.37 per US dollar for 28 months from March 1993 and July 1995 has abruptly given way to uncertainty and speculative fervour. This has happened because the earlier stability had been artificial, based as it had been on the growth of foreign exchange reserves attributable to rising portfolio investments from abroad, inflows on account of global depository receipts (GDRs) and foreign currency convertible bonds (FCCBs), larger unrequited transfers and some reversal of the earlier capital flight abroad. The claim that the stability of the rupee in terms of the dollar reflected economic fundamentals or the strength of the country's balance of payments was patently far-fetched. The accumulation of foreign exchange reserves was mistaken to denote this fundamental strength, even though a substantial part of the reserves emanated from a rapid build-up of foreign liabilities, of which a significant proportion comprised volatile flows induced by factors such as low interest rates abroad and sudden fascination of portfolio investors from the developed countries with the emerging stock markets.

The position of the country's own external sector in the medium term was far from secure and it was further weakened by premature liberalisation of imports, including of gold and silver. The authorities have lived in a make-believe world in regard to the import propensities of our economy. Thus even as the RBI governor was only recently projecting non-POL import growth of no more than 20 per cent for 1995-96, there actually took place a 29 per cent rise in non-POL imports in 1994-95 followed by a 42.7 per cent rise during April-August this year, with a rapid widening of the trade deficit. The likely merchandise deficit in 1995-96, which had been placed by the authorities at about \$4 billion earlier, has now been revised to \$6 billion. Likewise, the current account deficit, which was expected to be of the order of \$3.5 billion (or about one per cent of GDP), is now likely to touch \$5.5 billion or about 1.7 per cent of GDP. Net capital receipts are now expected to fall short of the current account deficit, necessitating a draw-down of reserves to the tune of about \$4 billion by the end of 1995-96. Total foreign direct investment (\$2 billion), portfolio investment (\$1.2 billion) and Euro issues and NRI investments (\$1.3 billion) would be slightly lower at \$4.3 billion against \$4.9 billion in 1994-95. The debt servicing burden, on the other hand, is expected to go up sharply from

\$10.8 billion in 1994-95 to \$12 billion in 1995-96 and further to \$14.5 billion in 1996-97.

It is also not as though the macro-economic imbalances prevailing before the onset of the so-called reforms have all been contained. The price situation remains disquieting and the fiscal situation very much more so, with the central government's revenue deficit quite out of control. The growth rate, particularly of industrial output, has picked up, but the impetus for this seems to have come essentially from what may be called 'borrowed' resources in the form of the large fiscal deficits and the rise in external liabilities. The overall domestic investment rate has not gone up, while the domestic saving rate has actually registered a decline. It was inevitable that the liquidity growth originating in the 'borrowed' resources would manifest itself in external sector imbalances.

Despite these salient facts of the economic situation being plain enough for anyone to see, the authorities chose to surrender what room for manoeuvre they had in responding to the emergent situations. It is hardly surprising that at the first signs of disquiet the foreign exchange inflows should have slackened and the external sector outlook changed dramatically. The authorities have taken pursuit of free market policies to mean adoption of a half-hearted approach to influencing exchange rate behaviour.

Till the end of August finance ministry and RBI spokespersons kept harping on exchange rate stability. In mid-September when there was a sudden depreciation of the rupee by about 8 per cent from Rs 31.41 to the dollar (RBI reference rate) in early August to Rs 34.15 on September 15 the authorities persisted with the theme of economic fundamentals being strong and did nothing to stem the fall in the value of the rupee. No indication was forthcoming of the government's determination to stem volatile market expectations and curb speculation. Also, few clues were available of the nature of the exchange rate policy being pursued. Given the goals of export competitiveness and macro-economic stability, what was considered the appropriate exchange value of the rupee and what was the range within which the authorities would allow the rate to fluctuate? It has emerged subsequently that the authorities were chary of entertaining any firm view on the exchange rate and were considering intervention essentially to minimise day-to-day fluctuations in the exchange rate.

Considering the fragility of the external balance and the persistence of major domestic macro-economic imbalances, this policy, if it can be called that at all, is a recipe for disaster. The rupee has already depreciated to Rs 35.60 per dollar or by about 12 per cent since early August. It has suffered a similar erosion of value in relation to almost all the major

currencies. In trade weighted terms, the real effective exchange rate of the rupee (REER) (base: 1985=100) was 61.02 in August 1993 and 66.08 in January 1995, showing an appreciation of 8.3 per cent but by August 1995 the REER had depreciated by 5.3 per cent. And in September-October so far the depreciation should be roughly of the order of another 10 per cent. Leaving aside periodic fluctuations in the REER, the rupee has generally seen a steady fall in value in real effective purchasing power terms, with the total depreciation working out to 45 per cent since 1985.

The domestic foreign exchange market has been gripped by substantial uncertainty essentially because RBI intervention has been delayed and half-hearted. Apart from the fluctuations in the exchange rate, the premia for the dollar in the domestic forex market have reached unprecedented levels. The cash to tomorrow (tom) market has been activated with a scramble for dollars, with the premium exceeding 7.5 paise against the normal 0.5 to 1 paise. Similarly, the cash to spot premia have reached an average of about 7 to 8 paise or a phenomenal annualised rate of nearly 21 per cent against the normal 1.5 to 2 paise (6 to 8 per cent). What is more, the six-month premia were reportedly quoted at about Rs 2.40 (13.5 per cent annualised) as against less than half of that level (Rs 1.10 or 6.5 per cent) a month back. Importers do not hesitate now to quote as much as Rs 38 for delivery just six months hence, in April 1996. The uncertainty is also reflected in the very large spreads between buying and selling quotations for almost all periodicities. Against the minimal, competitive spread of half a paise between cash-tom quotations, the spread was as much as 9 paise for 'buy' quotations and 5 paise for 'sell' quotations. Similarly, in the six-month forward quotations, the normal spread of 3 to 4 paise has been replaced by a spread of 10 to 16 paise. Besides, as a rare occurrence, the annualised premia have turned out to be significantly higher for monthly or three-monthly forward cover than those for six months. The exchange rate weakness is also reflected in the prices of Indian GDRs quoted on the international markets, reduced capital inflows and inflows of export receipts and, above all, inflows of normal remittances of NRIs.

It is significant that opposition to the depreciation of the rupee has come even from exporting interests, for beyond a point the rupee depreciation, apart from creating unsettled conditions in the market, would impinge on the cost structure of industries and on the domestic inflation rate, particularly when the import intensity of the economy in general and that of exports in particular is rapidly rising. In such a situation speculative forces will easily be able to absorb RBI intervention on the current scale of some \$300-\$500 million during this month. What is called for,

therefore, is not only more decisive intervention to curb expectational factors, but also some rethinking on the part of the authorities on some of the liberalisation measures which have promoted speculation in the foreign exchange market. Decisiveness on both these fronts alone can restore a measure of stability to the market.

PANCHAYATI RAJ

Making Political Capital

THE recently concluded conference of panchayat adhyakshas at Delhi is reported to have adopted a 19-point charter of resolutions to serve as "the guideline for future strategy". Among other things, the charter calls upon the state governments to take prompt steps to make panchayati raj institutions functional by devolution of powers, functions and finances. This must have been done in response to the genuine complaint by the adhyakshas that the state governments were hesitant in the devolution of powers, functions and finances to the PRIs in consonance with the provisions of the constitutional amendments on the subject of panchayati raj.

The question however is whether the resolutions of the Delhi conference will exercise a greater force than the provisions of the constitutional amendments in persuading recalcitrant state governments in the matter of devolution. Or, does the centre propose to take resort to the provisions of the Constitution that authorise the centre to issue directions to state governments? There is no indication from the reported deliberations of the conference that the centre has made any such commitment. If anything, its concerns seem to be very different, namely, to capitalise politically on the funds it transfers to PRIs for certain schemes and programmes.

This suspicion arises from the reported observations of the prime minister that the panchayat programmes and schemes which are financed by the centre "should be recognised and spent as such". The prime minister is particularly reported as taking umbrage at states "passing off central funding as their own", especially in the implementation of schemes like midday meals, old-age pensions and family insurance under the recently launched social assistance schemes of the centre.

Isn't the prime minister protesting too much? Almost all the states have been operating destitute and old-age pension schemes, no doubt with wide differences in coverage. Several states are also funding midday meal schemes and even family insurance of some sort. Of course, the states would most welcome central funding of these schemes. But for the centre now to claim full credit for taking initiatives in this regard, as the prime minister seemed to be doing, is bound to be resented.

The larger question that arises is whether the transfer of funds in the name of specific schemes and programmes in preference to block transfer to the states under the aegis of either the Finance Commission or the Planning Commission entitles the centre to turn around and claim recognition as the benefactor. The states have for long objected to the increasing trend in this manner of resource devolution, but now the centre is brazenly seeking to make political capital out of this mode of resource transfer.

UNITED NATIONS

Hidden Agendas

ON its 50th anniversary, instead of holding its head high, the United Nations (UN) finds itself at the crossroads. Despite some memorable breakthroughs in solving international crises in the past, its recent chequered performance in containing the conflicts in Bosnia, Somalia, Sudan, Haiti, Rwanda, Angola and Afghanistan has provided its critics with enough fodder. The critics point to the proliferation of UN agencies, councils and commissions yielding no concrete results except expanding its bureaucratic apparatus. They draw attention to the rampant mismanagement of WHO and UNESCO and proclaim that the ideals that inspired the UN are now obsolete.

But these critics, mostly hailing from western countries, ignore the fact that it is not the ideal of international community that has become outdated, but the composition of UN bodies, especially the security council, that has ceased to reflect the changed global geo-politics. Five decades ago, when there were 51 member nations of the UN general assembly, the security council comprised 15 countries. Today, when the tally of member nations has shot up to 185, the security council still remains confined to the original number of 15 countries. When most of the UN peace-keeping activities are directed at strife-prone regions in the third world, the security council carries no permanent member from Asia, Africa or Latin America, except China. Fidel Castro has rightly labelled the veto power and the restricted membership of the security council as "new colonialism within the UN".

President Clinton, shrewdly sidelining the controversial issue of democratising the security council, focused on the growing threat of terrorism, international crime and drug trafficking. It was not surprising of him to advise the UN to cut its bureaucracy and unwanted expenditure, given that the US owes 1.3 billion dollars to the UN, the largest amount of arrears of any member nation. In fact, by not paying the dues the UN can be held hostage and bullied into accepting programmes serving the interests of developed countries. All UN initiatives can be scuttled by delaying financial

contributions, thus laying the blame for international imbroglios at its door. The recent social development summit at Copenhagen witnessed the growing marginalisation of the UN economic and social council (ECOSOC) and its replacement by the economic agenda of the Bretton Woods institutions. The UNCTAD has been similarly upstaged by World Trade Organisation (WTO) and International Labour Organisation (ILO) is re-drafting its policies to suit the needs of the structural adjustment programme.

Yet, as never before, the vision enshrined in the UN needs resurrection. In a world which spends a mere two dollars per person on peace and 150 dollars per person on armaments, where one billion remain without clean water and 1.7 billion lack basic sanitation facilities, the UN can act as a voice of conscience questioning the accepted path of development. Though the UN needs to re-orient itself to tackle the phenomenon of internecine warfare, it equally needs to be protected from any designs to dismantle its structure.

WORLD ECONOMY

Jobless Growth

WHILE world economic growth in 1994, according to UNCTAD's Annual Report on Trade and Development, was a mere 3.1 per cent, world trade rose in volume by almost 9 per cent, i.e., almost thrice as fast as output. In fact, in dollar terms the growth in world trade was even more rapid, thanks to the fall in the value of the dollar against other currencies. Of course there were inter-regional and inter-country differences and that too within a wide range. It is noteworthy that for the group of countries going by the name of developed market economies while the rates of growth in output and trade volume were almost the same as for total world output and growth, their high levels of unemployment persisted showing little signs of decline.

The reason is not far to seek as far as output and trade are concerned. These economies still account for a major part, between three-fourths and four-fifths of world output and trade. Dynamic though the Asian developing economies are supposed to have been, their shares in world output and trade have not reached levels that would make a major impact on the overall world rates of growth, be it of output or trade. It was in the developed market economies that the increase registered in trade was markedly high and, within this group, it was in western Europe that strong export demand became the main factor in the economic recovery – total output in the European Union rose in 1994 by 2.8 per cent against a decline of 0.5 per cent in 1993. In the US also the significant step up in growth of output from 3 per cent in 1993 to 4.1 per cent in 1994 was

accompanied by growth in exports to the tune of 9 per cent, twice the growth registered in 1993. Only Japan was the laggard with output growth of less than 1 per cent and growth in export volume of 1.7 per cent.

Whether the growth in output and trade registered in 1994 is sustainable is the question of the future. UNCTAD forecasts a slow-down for 1995, possibly because the high rate of growth in world trade, the highest in two decades, may in itself be hard to sustain. Also it has to be borne in mind that much of the demand for exports of those countries came from the fast growing economies of Asia and they might well be slowing down. However, the basic problem the developed market economies have to tackle is that their internal demand is showing little sign of reviving, thanks largely to the high level of unemployment and sagging investment, particularly investment in infrastructure – the result of the social and monetary policies being pursued by their governments with overemphasis on price stability. Not for nothing does UNCTAD advise these countries to look inwards for solutions to their problems. The real culprit for job losses is the set of monetary and fiscal policies pursued in these countries.

UNCTAD is not an organisation that is looked upon with much favour by the developed world. It is supposed to be overly influenced by the concerns of the third world. But does the third world at least attach any weight to UNCTAD's analysis? If it does at least it won't resort to fiscal and monetary policies which result in high levels of unemployment alongside poor growth in output despite improved export performance.

BANGLADESH

Political Stalemate

MEDIATION by the US assistant secretary of state Robin Raphel has not apparently helped to end the political deadlock in Bangladesh as evident from the opposition led 32-hour strike which recently paralysed Dhaka and other major cities there. Raphel in a rather unusual diplomatic move, came down to Dhaka in early September to intervene between the two warring camps of the Bangladesh prime minister Khaleda Zia and the three-party opposition of Awami League, Jatiya Party and Jamaat-i-Islami, which had been demanding the resignation of the Khaleda Zia government and the holding of fresh elections under a neutral caretaker administration. That both the camps, unable to agree upon a third-party arbiter within the polarised political scene of Bangladesh, were willing to accept Raphel as a mediator was evident from the way both Khaleda Zia and the Awami League leader Sheikh Hasina welcomed her to their respective headquarters to listen to her long homily advising them to make up. But

obviously, Raphel could not come up with a formula acceptable to both.

The failure of the Raphel mission indicates the growing predominance of indigenous compulsions of political forces in Bangladesh which for the time being appear to prevail over the economic interests and needs that are shared in common by the Bangladeshi industrialists and their US collaborators. It is significant that every time there is a strike (and strikes in Bangladesh usually stretch beyond 24 hours), Dhaka's business houses appeal to both the government and the opposition to come to some settlement to spare them the financial losses that they incur. Foreign investors and collaborators as well as Bangladeshi industrialists are upset by the political crisis that had been dragging since December last when all the 144 opposition members resigned from parliament and launched an anti-government movement in the streets. The opposition has now threatened to plan a 96-hour strike along with sit-in demonstration in front of the prime minister's residence to put further pressure on Khaleda Zia to concede their demands.

Khaleda Zia, in a bid to delude the crisis, has offered to resign along with her cabinet colleagues only 30 days before the next elections. She has a five-year mandate to rule till April 1996. Till now she has neither announced the date for the next general elections nor spelt out the framework of the interim government that is to conduct the polls after she resigns. She rejects the opposition demand for a neutral caretaker government as there is no such provision in the Constitution while the opposition parties suggest that the Constitution can be amended to provide for such an eventuality and ensure free and fair elections under a non-partisan caretaker prime minister (such as the Supreme Court chief justice).

Meanwhile a constitutional crisis has developed. Under the Constitution the Bangladesh parliament cannot amend the Constitution or impeach the president without at least two-thirds of the total members present. With the resignation of the 144 opposition members, the membership of the legislature has been reduced to less than two-thirds. Since these members had not attended parliament for 90 consecutive days, their seats had been declared vacant and fresh elections were to be held under the law in their constituencies by May 3 this year. But the chief election commissioner has deferred by elections to the vacant seats till mid-December on the ground of floods which are being described as an act of god. A term in Article 123(4) of the Bangladesh Constitution under which the decision has been taken. Constitutional experts feel that since the seats still remain vacant even after the expiry of the last date for by-elections, the basic structure of parliament has collapsed as it cannot constitutionally perform all its functions.

(e.g., amendment of the Constitution) The opposition demand for amendment of the Constitution to provide for a caretaker administration to conduct the elections therefore has thus been rendered infructuous by the opposition parties themselves through their resignation from parliament

Given this situation, the opposition may have to opt for a flexible course of action. Continuous strikes and demonstrations involving violent clashes with the police and musclemen of the ruling BNP party which have dominated Bangladesh politics during the last nine months, may have proved the opposition point that the Khaleda Zia government has lost its capacity to run the administration and maintain order. But these tactics cannot be repeated ad nauseam without losing public sympathy. While the opposition parties maintain that their movement is for the people's right to food and livelihood, successive strikes for days together mean for all practical purposes for the poor denial of their daily bread.

Despite the nonchalant front that Khaleda Zia is trying to put up by refusing to entertain the opposition demand, she is also saddled with a corrupt administration and oppressive police force that have tarnished the image of her four-and-a-half year old regime. A recent case of rape and murder of a girl by the police in Dinajpur – which has come in handy for the opposition parties in their present campaign against her – forced her to go to Dinajpur and apologise to the aggrieved people there. But her pusillanimity and dependence on the police were to become evident soon when she was persuaded by the home ministry to go slow on the arrest and prosecution of the guilty policemen.

Both Khaleda Zia's ruling party, the BNP and the opposition three party combine are thus bogged down by their respective compulsions – the former to cling to power and the latter to capture power. For the Bangladeshi voters the choice is between Tweedledum and Tweedledee. They have had the taste of governance by two from among the present three party opposition combine. Awami League under Sheikh Mujib from 1972 to 1975 and the Jatiya Party under Ershad's martial regime till 1991 – which had not been quite a happy experience for them. The third member of the combine, the Jamaat-i-Islami, even without being in power is already forcing down on Bangladeshi society an alien Islamic fundamentalism imported from Saudi Arabia, through its paid mullahs in villages who flog and lynch women for their alleged misdemeanours. Riding piggy-back on the opposition campaign against the present regime, the Jamaat politicians who had till recently been treated with contempt by Bangladeshis because of their collaboration with the Pakistani army during the 1971 liberation war, and who could not garner any significant number of votes at the last elections in 1991 – are

gaining respectability among the electorate, and they are sure to make use of it in the coming elections.

PALESTINE

Illusion of Self-Rule

ON September 29 yet another highly publicised hand shake was organised at the White House at Washington between Arafat and Rabin, witnessed this time by king Hussain of Jordan and Hosni Mubarak of Egypt in addition to the host Bill Clinton. This was the finale, delayed by a whole year, to the two-year long negotiations since the first hand shake in Washington.

But was the delay worthwhile? The Israelis may think so because in the process of the long, protracted negotiations they could beat Arafat and his team down to the very minimum of devolution of land and power to the Palestinians. After 28 years of occupation, all that the Palestinians get as a result of this second accord referred to as Oslo II (the first accord signed exactly two years back is generally referred to as Oslo I), is municipal authority over the towns and villages (not all of them even since Israel will continue to occupy 50-60 villages out of 450) in the West Bank, "with no real security responsibility, no right to resources or land outside the population centres and no authority at all over Israeli centres, police and army stationed in the West Bank" as Edward W. Said of Harvard University, a well known observer of west Asia puts it. Although Israel will move its troops out of the towns it hands over, it will establish 62 new military bases. Not only will the Israeli settlements remain untouched – indeed in these first two years since Oslo I, there has been virtually no freeze on the expansion of settlements, particularly in and around East Jerusalem which is being systematically transformed into a Jewish town – but also a road system will connect them to one another making it possible for settlers, like whites in the old South Africa, to avoid or even see the people of the Bantustans and making it impossible for Palestinians to rule over any contiguous territory.

Oslo II may give the outward appearance of self rule for Palestinians but it will be self rule without the reality – "a kingdom of illusions with Israel firmly in command". The so called legislative council of 82 members to be elected by next March will be a legislative body only in name, both because the subjects under its control are no greater than those of a local body and also because Israel retains veto over any piece of legislation that this body passes. Arafat will no doubt have the satisfaction of promoting himself to presidency of the Palestinian Authority but to all intents and purposes he will be no better than a civic body chairman – something like the president of a typical zilla parishad in India.

TWENTY YEARS AGO

EPW, October 25, 1975

TO live under the executioner's shadow for four years is to die in instalments. Gunal Kista Gowd (45) and Jangam Bhoomiah (48), who belong to one of the now-illegal Marxist-Leninist groups in Andhra Pradesh, were sentenced to death in 1972. All had been set for their execution in the early hours of November 26, 1974 when the Chief Minister of Andhra was prevailed upon to stay it. The execution was then set for May 11, 1975 when a group of young lawyers sought to save the lives of Kista Gowd and Bhoomiah through a writ of the High Court. A few hours before the scheduled execution, they obtained a stay from the vacation judges. But the writ petition failed and the matter was taken to the Supreme Court which on October 3 rejected the petition for special leave.

The arguments in the petition before the Supreme Court were based on socio-legal grounds. The petitioners had acted in the manner they did because they were appalled by the injustice of the massive suffering and suppression of the poor and they wanted to shock and shake the custodians of the status quo. Their act therefore stood on a separate footing from the common run of crimes, further, there has been a growing trend against the death penalty as legal barbarity discernible in the pronouncements of the Supreme Court and the penal reform currently before parliament. The president had not taken these factors into account when he rejected the mercy petitions.

However, while rejecting the petition, the Supreme Court visualised the contingency of the petitioners appealing once again for clemency, setting out various factors which the court may not be concerned with while imposing the sentence but which may still have persuasive value before the concerned executive. "The rejection of one clemency petition does not exhaust the power of the president or the governor", the Supreme Court said.

The last-chance-to-live for the two condemned political workers thus once again lies in the area of presidential clemency. Over 130 Supreme Court lawyers, including several former chief justices and judges of high courts, have appealed to the president to commute the death sentences.

RALLIS INDIA

Inputs Package for Farmer

RALLIS INDIA, a member of the Tata group, is a leading agrochemicals manufacturer and has pesticides and fertilisers accounting for over 60 per cent of its total sales, the rest coming from the pharmaceutical and export divisions.

The year 1994-95 saw the company complete 50 years in business. It achieved a turnover of Rs 647 crore, a rise of 28 per cent from Rs 504 crore in the previous year. Total income of the company rose by 28 per cent from Rs 524 crore to Rs 670 crore. Provision for depreciation rose by 21 per cent. A corresponding rise was witnessed in tax provision which rose by 44 per cent. The disposal by the company of its holding in Boehringer Mannheim (India) during the year contributed handsomely to net profit. The company has maintained a 45 per cent dividend for the year under review.

The exports division deals with garments and marine products. The exports stood at Rs 67 crore, up by 27 per cent as against Rs 53 crore in the previous year. Imports increased by 137 per cent from Rs 52 crore to Rs 122 crore. As a result of the sharp rise in cotton prices the division suffered a setback. The marine products department saw a revival with emphasis being laid on higher value added products to ensure profitability. The company exports a sizeable quantity of agrochemicals to developed countries such as the US and western Europe.

During the course of the year the agrochemicals division also established Acephate, as a leading insecticide in India. The year also saw the expansion of the basic manufacturing facilities.

The performance of the pharmaceutical division showed improvement in the operating year as a result of restructuring and pruning of the product portfolio. Production facilities at the Madras and Aurangabad factories were upgraded in order to reduce manufacturing costs. The fine chemicals division put up a satisfactory performance. The distribution of gelatine and chemicals was satisfactory.

The company has a major Rs 150 crore expansion plan of which Rs 90 crore is to go towards the setting up a new agrochemical unit at Lohte in Maharashtra. Rs 15 crore has been set aside for expansion schemes at the pharmaceuticals and the fine chemicals divisions, while the remaining Rs 30 crore is for investment in related projects. Also in the pipeline is a marketing tie-up with the Danish multinational Novo Nordisk for the introduction of a vegetable crop bio pesticide. The company is contemplating an entry into tissue culture. The R and D division is currently working on the development of commercial prototypes for tissue culture

products in the flower and fruit segment. Work on a project for vegetable tanning extract based on technology from the Central Leather Research Institute, Madras, is also under way. Vegetable tan is a natural product and is more environment-friendly as compared to synthetic tans which is the main cause of pollution in tanneries. The company has set up a formulation and packaging factory in Akola.

The company is planning to expand its range of ayurvedic products with three new brands being added to the existing line of products. Rallis agrochemical research station in Bangalore is the only one of its kind in Asia besides Japan, certified by the German certification authority, Bundesgesundheitsamt (BGA). Rallis produces several basic pesticides and exports a sizeable quantity of agrochemicals to developed countries such as the US and the countries of western Europe.

With a move to phase out its manufacturing activity from the metros, Rallis hopes to put its several underutilised properties there to use. The company plans to develop its metropolitan city offices commercially.

AEC

New Projects

Ahmedabad Electricity Company has come a long way from being a small diesel generating power station set up in 1915 to being one of the leading players in power generation and distribution. The Gujarat government holds a 24 per cent equity, financial institutions hold 33 per cent and the Torrent group 9 per cent, the remaining being held by the public.

The company achieved a sales turnover of Rs 510 crore for the year ended March 1995 against Rs 435 crore, a rise of 17 per cent. Total income rose by 18 per cent from Rs 449 crore to Rs 532 crore. There was a marginal fall in interest cost which came down by 6 per cent. The company achieved a gross profit of Rs 59 crore against Rs 39 crore in the previous year. An increase in provision for depreciation which rose by 52 per cent and a zero tax provision saw the company close the financial year with a net profit of Rs 14 crore, up by 48 per cent compared to Rs 9 crore achieved in the previous year. A dividend of 18 per cent has been recommended by the board of directors.

The company had 8,07,684 consumers at the end of the year against 7,70,755 in the previous year. At the end of the year there were 2,232 kms of high tensions and 6,783 kms of low tension mains in the system against 2,160 kms and 6,150 kms, respectively, in the earlier year. 138 new substations were added during the year. The company has an annual capital outlay of

about Rs 37 crore for systems improvement and development. The company has major plans for system augmentation at a capital cost of Rs 40 crore, the finance for which has been raised through rights and public issues.

The power services division improved its performance and has achieved a profit of Rs 335.63 lakh, 15 per cent higher than last year. The sales of the fly ash division stood at Rs 62.32 lakh, an increase of over 30 per cent over that of the previous year. The company has identified new power projects to meet the shortfall in demand for power in the company's system.

KEC INTERNATIONAL

Joint Ventures Abroad

KEC International, a Goenka group company, is in the business of manufacture and supply of power transmission line towers and execution of turnkey projects for transmission lines. The company is engaged in designing, fabrication, galvanising and erection of transmission line towers. The RPG family owns about 43 per cent of the total capital, Indian institutions and mutual funds together own about 18 per cent, while FIIs and the public own 19 per cent and 20 per cent, respectively. With the acquisition of SAE India from the Asea Brown Boveri (ABB), the RPG group is the largest in the industry. SAE is the leader in railway electrification in India and has a manufactur-

ing capacity of 36,000 tonnes of power transmission line towers per annum, which is proposed to be expanded to 56,000 tonnes per annum.

The company achieved net sales of Rs 391 crore for the year ended March 1995 against Rs 254 crore in the corresponding period in the previous year, a rise of 57 per cent. Total income of the company rose to Rs 419 crore up by 61 per cent from Rs 260 crore in the previous year. There was a fall in interest payment from Rs 8 crore to Rs 5 crore for the year under review. Gross profit went up by 41 per cent from Rs 28 crore to Rs 35 crore. A 22 per cent increase in the provision for depreciation was nullified to a large extent by a fall in tax provision which came down by 24 per cent. The company closed with a net profit of Rs 30 crore, up by 65 per cent from Rs 18 crore last year. Enthused by the buoyant performance, the company has declared a dividend of 45 per cent. The management has also proposed a bonus share issue in the ratio of one share for every two shares held.

KEC executes contracts for exports, for state electricity boards, for IBRD projects in India and for central power projects. These are a mix of vanilla sales, supplies and construction, and turnkey projects. Of these turnkey projects contribute over 40 to 45 per cent of sales and 70 per cent of export orders. KEC had been exporting transmission line towers to about 30 countries and has plans to set up joint ventures abroad for manufacturing towers and transmission lines.

During the year under review, production of transmission line towers increased from 52,992 mt to 68,280 mt, registering a growth of 29 per cent. The company received orders worth Rs 443 crore and the order level as of March this year was Rs 520 crore compared to Rs 457 crore in the previous year with more than 50 per cent being export orders. KEC has a market share of about 35 per cent in high voltage transmission business and has huge orders on hand. Keeping the future scenario in mind, the company which has a capacity of 7,500 mt per annum is raising it by another 3,500 mt by setting up a new plant at Nagpur at an estimated cost of Rs 24 crore. Production is expected to commence in the current year.

The division which manufactures methyl ethyl ketone (MEK), ISO propyl alcohol and other products saw sales double to Rs 36 crore.

KEC is exploring the possibility of setting up joint ventures in China, Africa and South America. As a part of its globalisation strategy, the company is setting up two overseas joint ventures in Vietnam and Malaysia. Plans are on to invest Rs 2.5 crore for a 49 per cent equity stake in a joint venture with Hoerbiger Ventilwerke AG of Austria, the rest being held by Hoerbiger. The company plans to make valves and other engineering products near Pune. The company has raised resources to finance its various expansion plans by private placement of shares.

CURRENT STATISTICS

EPW Research Foundation

Disbursements of the all-India financial institutions generally financing investment by large-scale enterprises grew by nearly 200 per cent between 1990-91 and 1994-95, while those of institutions supporting small- and medium-scale industries rose by only about 62 per cent (or just equal to the inflation rate). Growth of M, and reserve money slowed down in the first half of 1995-96. The rise in net bank credit to government, in particular that in RBI credit, was high, reflecting the central government's massive borrowing programme. Bank credit to commercial sector remained sluggish. Aggregate bank deposits grew by a mere 2 per cent, the lowest in history for a half-year period. Incremental money multiplier, behaving in a see-saw manner, was high at 3.56 against 2.28 and 3.11 in the preceding two half-year periods.

Monetary data are based on March 31 figures both for RBI and scheduled commercial banks after closure of government accounts

Notes: (i) Superscript numeral denotes month to which figure relates e.g. superscript 7 stands for July (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year

Learning and Money

Children as Pawns in Dependency Game

Krishna Kumar

A consensus of interests has emerged inspiring everyone concerned to believe that the new money available for primary education is a sign of change of heart among the wealthy and that it represents a rare opportunity for us to break the cycle of poverty, child labour, lack of education and poor productivity.

DEPENDENCE on foreign resources for expansion and improvement of primary education, and privatisation of higher education are two salient features of the emerging educational policy. Considering that neither has systemic precedence, together they can be said to form the real and 'new' educational policy replacing the much-publicised National Policy document of 1986. It is not as if 1986 was too early to foreshadow the impending. On the contrary, plans for large-scale induction of foreign resources – both funds and expertise – were already afloat and international consultants knew what was cooking in the oven of development business. In retrospect it looks as if it was all a coincidence, but such a view can only be superficial though it has the merit of being consolatory. As far as India is concerned, it is clear that in the years during which the Jomtien conference (March 1990) on 'Education for All' (EFA) was being planned, details of the social safety network were also being worked out to be revealed to the innocent after the announcement of the structural adjustment programme (SAP). Jomtien is now referred to as a turning point at which the attention of the wealthy nation-states was forced upon the plight of the poor, especially the latter's children. No one now needs to be told that Jomtien was merely the venue of a public ceremony at which the poor were introduced into the nasty new world of post-cold war capitalism. For India, Jomtien was the beginning of a structurally adjusted political economy of education. It is hardly surprising that policy documents of the 90s mention Jomtien rather than the Indian Constitution as the origin of the concept of universal schooling. To expect that Gokhale or Tagore might have formed relevant references is to be too arcane and hopelessly 'swadeshi' which only the RSS can afford to be.

Let us realise that there is nothing startling for us to discover in the new economy of primary education, simply because the government has by itself revealed it all. The document titled 'Education for All', published by the government on the occasion of the so-called summit (most heads of states

remained absent) of nine high-population countries (Bangladesh, Brazil, China, Egypt, India, Indonesia, Mexico, Nigeria, and Pakistan) held in December 1993, states with transparency. "The concept of comprehensive district-based projects came of age with the launching of the District Primary Education (DPEP) – the primary education component of the Social Safety Net Adjustment (credit financed by IDA)" (sic).¹ True, these words were written for a clientele consisting mainly of educationists who have little interest in the meaning of words like 'adjustment' and 'social safety'. Individuals who might be familiar with the history of IDA funding and its aftermath in Africa and Latin America have been marginalised, in any case, as part of the fashioning of the new ideological state apparatus of education. If the new class of professional experts and assistants serving education were to be told that 'social safety' really means discouraging political turmoil expected as a result of the 'adjustment', and 'adjustment' means getting ready for deeper penetration by advanced capitalism, they will find this kind of decoding quite uninteresting. Bureaucrats are, of course, aware of these meanings, but their roles and positions do not permit them to acknowledge this awareness, let alone use it to steer policy. Many politicians too know these meanings, but they privately acknowledge the futility of efforts to stem the force of new economic agendas. Thus, a consensus of interests has emerged, inspiring everyone concerned to believe that the new money available for primary education is a sign of change of heart among the wealthy and that it represents a rare opportunity for us to break the cycle of poverty, child labour, lack of education and poor productivity.

It is noteworthy that in the army of educationists and pedagogues currently under recruitment across the country, members of non-government organisations (NGOs) have a very special place, Jomtien dictation recognises NGOs as 'prime delivery mechanisms'. That the NGOs could provide a valuable intermediary class, having links with bureaucratic and industrial elites on

one hand and the downtrodden on the other, is certainly one attraction. But a more palpable reason to recruit them as agents of state-sponsored programmes is that it protects them against the tendency to get politicised in the course of working for the poor. NGOs working for women and children have presented plenty of examples of this tendency in the recent past; the process of induction in well-funded (read foreign-funded) state programmes discourages this tendency. Moreover, NGOs impart a pluralistic character to development, masking its monotonic, ideological roar which has become increasingly unbearable since the 70s when Doris Lessing recorded it in her *Summer before the Dark*.² The young, often highly sensitive and professionally competent members of NGOs, need to be brought into the international business of development and socialised into the culture of sponsored work, or else they might lend their weight to social and political forces impeding development work, for instance in the case of Narmada dams. It is time we recognised that NGOs are conceptually a part of the state apparatus, not outside it, practically, there may be substantial resistance among NGOs to being co-opted.

Foreign loan and aid for primary education now constitute a significant part of the social safety network – a euphemism used for maintaining the facade of the welfare state while it is being demolished and reassembled into a commercial agency state serving global capitalism. Foreign-assisted projects like the DPEP have a scale unprecedented in the history of social programmes assisted from outside. The DPEP started in 43 districts, within the Eighth Plan period, it will spread to 110 districts, and the number will more than double soon thereafter. The kind of money it provides for at the district level implies an enhancement of five times or more of customary spending. The fact that donor agencies are not sure about the district-level machinery's ability to spend this much more money is best reflected in terms like 'capacity building' and 'accountability' which dot programme documents more than any other technical terms. As it happens, district-level proposals were written according to the format provided by the donor agencies themselves, and monitoring by foreign experts and consultants continues to be followed as a norm a little too visibly under the cover of decentralised planning and self-monitoring. The excess money presents an all too real, and in certain states already manifest, risk of soaking the new Panchayati Raj to its roots in corruption. There is also the risk of creating heavy liabilities for the future. Is the creation of such liabilities a part of the scenario of engineered indebtedness and political

vulnerability? Wadi Hadded, World Bank's representative to the UN, offers us the basis for precisely this question when he says that an aid-receiving country "needs a level of expenditure in the next decade or two that may not be self-sustainable, in order to reach the higher levels of development in subsequent decades, when it then (*sic*) will be able to sustain such expenditure on its own".¹

It is clear that to believe in the correctness of the current policy of financial dependency for improvement in primary education one is required to believe in the ultimate promise of structural adjustment itself. The whole package is really a belief structure as Susan George and Fabrizio Sabelli show in their recent book on the World Bank.⁴ On the matter of World Bank's portrayal of a rosy future following the current phase of aid-dependent social programmes such as the DPEP, George and Sabelli correctly ask why the Bank failed miserably to predict the ghastly effects of debt trapping which surfaced in many third world countries during the 1980s. How stark and tragic the effects were in the context of children's welfare formed the focus of UNICEF's report, *The State of the World's Children* in 1989. The report said in surprisingly clear but little noticed terms:

As the social effects of adjust processes become more obvious, it can also be seen that the heaviest burden is falling on the shoulders of those who are least able to sustain it. Over the last decade, for example, the proportion of government expenditure devoted to health has fallen in most countries of sub-Saharan Africa, in more than half the countries of Latin America and Caribbean, and in one third of the nations of Asia. And the cuts have not been marginal. Meanwhile, the proportion of national budgets devoted to the military is approximately 30 per cent higher than total spending on health and education combined.

UNICEF's staff know from first hand experience that in most countries the real cost of such cuts is being paid disproportionately by the poor and by their children. And since 1984 we have been concerned to draw world attention to the social consequences of adjustment policies and to warn that the worst is yet to come.⁵

Surely we have the right to ask the government how it proposes to sustain high levels of expenditure on primary education after the social safety net provided by foreign help and loan is lifted. So far the government has not presented any plans for the future. Perhaps it is unnecessary to ask such questions when the government has not quite decided how to use the excess funds that have become available. Financial management has proved the most difficult aspect of 'capacity building' not just in the context of foreign funds but even the extra funds provided out of indigenous resources. The failure of Operation Blackboard in the states where it was most needed is a case

in point. The Comptroller and Auditor General's report released earlier this year found glaring deficiencies in the manner in which Operation Blackboard funds were utilised. In Madhya Pradesh, where DPEP has begun in full earnest under the auspices of the Rajiv Gandhi Mission, Operation Blackboard could not proceed beyond the second phase when inquiries into charges of corruption in its handling resulted in stoppage of further utilisation of the funds available under it. That was three years ago.

It is ominous that foreign-assisted primary education has received no systematic critical attention from educational institutions involved in research and professional training. The only critical piece to be published so far is Vinod Raina's in the *Alternative Economic Survey*, which says that the 'real danger' of DPEP lies in its capacity to purge the search for alternatives in education and 'to bring it in line with a homogeneous and globalised world propelled by the market'.⁶ The risk of education being used as a tool of ideological indoctrination is, of course, real, but not as direct and immediate as the one involved in the penetration of the rural hinterland by research methods and data-designs cloaking ulterior motives. It is not for nothing that under the banner of 'accountability', donor agencies are demanding achievement profiles of elementary school children. The emphasis on psychometric surveys and regular reporting on achievement levels attained by every child is a bit too loud for anyone to accept that it reflects a purely pedagogic concern. The language in which, for instance, a World Bank office memorandum talks about the modalities of achievement data is very suggestive indeed.

Modern psychometric techniques will be applied to student learning achievement data and each country will produce a national report describing achievement levels and the distribution of school resources by geographical areas, and types of schools and students provide an analysis of the determinants of student achievement, analyse the effects of any policy changes on learning achievement changes over time and draw overall conclusions. This report should be produced regularly (annually, biannually, triannually). Approximately six months (*sic*) required for analysis and report writing. Assistance will be provided for local researchers to conduct secondary data analysis and to publish their results in international refereed journals.⁷

It is hard to imagine that this elaborate data base on our children will have no use other than pedagogic reform. Why is it that one has never heard of such data being collected in developed countries, let alone published regularly? The ineffectiveness of primary education in some of the richest countries of the world, including the US and Canada, has been a frequently reported fact over the recent years but no one has suggested

rigorous maintenance and publication of psychometric data as a remedy. Even the International Association for the Assessment of Educational Achievement (IEA) studies which were carried out in the 70s on limited size samples, were resented by many developed countries. Perhaps the real reason why our young professionals will be trained in psychometric techniques (educational research in India has already suffered enormously by exaggerated emphasis placed on such techniques in the training of researchers) and why our system will be asked to reveal each tiny detail of children's attainment by geographical region is such data can help in the geographical shaping of foreign investments, especially in the negotiations for investment potential of different regions.

These are only a few among the many questions we need to ask in order to probe the emerging political economy of primary education. There is, of course, no doubt that the current efforts heavily funded though they are, will fail to stem the rise in child labour and school drop-out rate. Education for All will remain a mere slogan well into the first quarter of the coming century simply because economic compulsions imposed upon us in the post-GATT era can only result in the cheapening of our labour resources and the consequent exacerbation of problems such as child labour and child prostitution. The brave new world of global trading and capital moving at the speed of telecommunications offers no room for compassion and grace for children, especially those born in third world countries. The future of learning during childhood looks bleak everywhere simply because advanced capitalism looks down upon the sacredness and specificity of the local milieu which Dewey had celebrated as a principle of sane pedagogy. The only hope there may be for children, especially ours, lies in the future of democratic politics which may reverse the sinister trends set by the structural adjustment programmes.

Total Literacy Campaign in West Bengal: An Appraisal

Tushar Mukherjee

The post-literacy programmes have been unable to address the predicament of fragile standards of literacy achieved under the total literacy campaigns.

AFTER Kerala, West Bengal perhaps is the only state which is relentlessly marching towards total literacy. Out of 18 districts, 16 have already come under the literacy campaign and the other two – North Dinajpur and Darjeeling – are likely to join the rest very soon. As per a state government handout published on the eve of International Literacy Day on September 8, 1994, eleven districts have already completed the first phase of the campaign with varying degrees of success and have embarked upon the post-literacy stage. Out of eleven, however, only four districts, viz, Burdwan, Birbhum, North 24-Parganas and Hooghly, could achieve 80 per cent or more rate of literacy among their target groups and could claim to be a literate district as per norms prescribed by the National Literacy Mission (NLM), the governing body of our national literacy efforts. A few more districts, nonetheless, have declared themselves fully literate on the basis of other criteria. Most notable of them were Midnapore and Bankura which had achieved 51.24 per cent and 6.29 per cent rate of literacy among their target groups, respectively. In total terms, out of 13.57 million brought under the campaign, 6.61 million persons have already been made literate. This is no mean achievement, although it falls far short of the expected outcome.

The NLM has been regularly bringing out reports entitled, 'Status Report of Literacy and Post Literacy Campaigns'. These reports have been compiled up to November 1994, on the basis of:

(1) Monthly progress reports submitted by different zilla saksharata samities (ZSS) in the proforma prescribed by the NLMA;

(2) Consolidated reports from state adult education directorates;

(3) Feedback received from the state chief secretaries/education secretaries in response to letters addressed by the government of India;

(4) Visit reports of NLMA members and departmental officers;

(5) Internal and external evaluation reports received from time to time.

On perusal of a report which describes status of various districts both for literacy and post-literacy between the period from December 1993 and February 1994, it appears that none of the districts could record progress and did not feel it necessary to send any report to the NLM. The current achievement percentage of various districts, according to the report, is: Burdwan-87.5 per cent, Birbhum-82.8 per cent, Bankura-73 per cent, Hooghly-71 per cent, North 24-Parganas-62.2 per cent, Cooch-behar-54.9 per cent, Midnapur-52.1 per cent, Murshidabad-44 per cent, and South 24-Parganas-21.2 per cent.

It is therefore certain that, except for Burdwan and Birbhum, none of the districts were entitled to declare themselves as fully literate districts. Nonetheless, they have declared themselves literate and with more than necessary fanfare. The claim of Birbhum was however hotly contested by a study conducted by the redoubtable Indian Statistical Institute, Calcutta which was not at all ready to ascribe more than 50 per cent achievement rate after conducting a sample survey by a team of experts. There is also some confusion about the claim made by Burdwan district. Final evaluation of learners in the district was done in April 1991 while decadal census operation was completed in March 1993. The latter revealed a literacy rate of only 62.7 per cent, far short of the claim made by the district. The district stated that learners covered by them were excluded from the number of literates shown in the census data. This is difficult to accept in view of the fact that Burdwan and Midnapur, which started the total literacy campaigns (TLCs) almost simultaneously, recorded phenomenal decadal literacy growth rate of 12.6 per cent and 17.7 per cent, respectively, indicating positive impact of TLC on the literacy rate. While Midnapur acknowledged, Burdwan did not.

Deficiencies in the TLC become more compounded when post-literacy scenarios of the 'literate districts' are taken into account. In the words of NLM report referred to above, 'The reporting status of post-literacy projects is also far from

satisfactory. Only three reports were received against seven ongoing projects. The situation in Midnapur appears to be in deplorable condition. In Burdwan, out of 10.49 targeted neo-literates, 6.45 lakh have completed post-literacy (PL) phase while Hooghly did not send any report since the project was sanctioned in May, 1992."

Post-literacy in West Bengal is in fact an euphemism for extended TLC because the major task of this phase is consolidation of literacy with the help of a 3rd primer which was originally designed for inclusion in the literacy phase as per IPCL methodology. The competencies recommended by the NLM did not anticipate a fragile level of literacy which could be of no use unless backed by so-called post-literacy efforts. Hence, the word 'neo-literate' bandied about in the post-literacy projects are myths and only half-literate persons were produced everywhere at the conclusion of TLCs. If this is the fact then we may surmise that lakhs of neo(half)-literates have reverted to illiteracy due to failure of the post-literacy projects. Even in case of Burdwan which has some PL records to show, more than four lakh neo-literates could not be brought under the post-literacy umbrella and were lost from the total achievement of the district.

The Arun Ghosh Committee which evaluated literacy campaign in India has pointed out serious lapses in external evaluation methodology and has in fact branded them unreliable in view of their deficiency in terms of coverage, sample design, size of samples and in the estimate procedure adopted to arrive at district level estimates. Since all the TLC districts of West Bengal suffer from all the deficiencies mentioned by the Ghosh Committee, the estimates of the state in the campaign need drastic discounting.

TLC is claimed to be superior to former project-based literacy schemes. The most important argument in favour of TLC is that it is cost effective and cheapest literacy programme of the country. Cost per learner in former RFL projects was around Rs 80. The cost calculation for TLC is given in Table 1. It appears that barring Burdwan and Birbhum, remaining 5 districts have exceeded the per learner cost of RFLP although above cost structure did not include expenditure incurred from local resources which may run into several lakhs in every district. Moreover, the RFLP was run by honoraria-paid volunteers whereas in TLC any kind of remuneration was strictly prohibited. If, however, we calculate the cost-equivalent of the labour of voluntary instructors even at the rate paid to the RFLP volunteers (@ Rs 100 per

month), then the cost would far exceed the per learner cost under RIEP

BASIC DEFICIENCIES

In the background of none too happy performance of the TLC both in terms of achievement and in terms of cost effectiveness it would not be out of place to examine the process through which the campaign has been run so as to find out if there was any conceptual or structural deficiencies in the whole system which rendered this wholly plausible and achievable method of literacy campaign somewhat off the track.

First of all it must be loudly proclaimed that the campaign method as against project method adopted earlier is the only method through which huge backlog of illiteracy can be removed. In all the developing countries which have recorded phenomenal success in eradicating illiteracy campaign method based on voluntary participation was adopted with excellent results. Kerala having moderate success introduced the method in India after borrowing the concept from successful developing countries. NLM has more or less tried to adopt the Kerala model and there is no reason why West Bengal, which also drew its inspiration from Kerala directly and well before NLM adopted the method should not be as successful. To find out the reasons of TLC performance it is necessary to examine a few basic features of the campaign mode and see how far those features were in operation in West Bengal.

Centre based vs Learner based. The most important basic feature was substitution of centre-based teaching learning process with learner based process. In the former system emphasis was given to establishment of literacy centres where learners would be brought—almost a replication of formal school system. Lesson learnt was that centres were established but learners did not come. There were a number of reasons. The most crucial among them was that the centre and its timetable did not suit the convenience of the learners, exactly for which children do not attend primary schools. Campaign method underscored the importance of learners, their convenience, their priority and their preference for learning places. And also the learning time. Hence the voluntary teachers (VTs) were instructed to meet the allotted learners first and then fix up learning time and venue. But in most of the TLC districts these plans remained on paper only and the old-type centres were organised. The only difference this time was that these TLC centres were inconveniently located in places where anything but learning took place. In fact learning environment in TLC centres was worse than earlier project type centres.

Learner VI Ratio. The second feature was that number of learners per teacher should be as little as possible on the assumption that TLC primers need more intensive and personal coaching so that end of lesson workouts and periodic self-evaluation did actually take place under the watchful eyes of the teacher. In almost all the districts of West Bengal number of learners per centre varied from 10 to 15 precluding any chance of intensive teaching learning process and closer teacher learner relationship. TLC learning groups were not only disparate, they were also forced to come from places far from their hearth and home in semi alien ambience much below minimum comfort level. The ideal situation would have been to appoint a VT from a family who could cover his/her own family members of 2/3 persons and a few more from amongst his/her close relatives so that s/he can choose any venue and instructional hours as may be convenient to the learners. This micro level nuclear learning groups are highly motivated to learn seriously and complete the lessons uninterruptedly which is otherwise impossible as has been found in most districts to the utter frustration of the TLC managers.

Universal Participation. The third and the most important feature of any secular and non partisan campaign was unreserved participation of the entire community irrespective of political, social, economic and communal divergence. In West Bengal however the ruling elite could seldom rise above the sectarian political cocoon and embrace with open hands all other political forces, even their own political allies. Assistance of NGOs wherever extended was disdainfully refused.

Environment Building. The NLM has made liberal provisions for environment building (EB) and most TLC districts were flush with EB funds. But these funds were more misused than used. There was a stiff competition among various districts to churn out novel 'fancy' 'culture specific' motivational programmes suitable to the local needs. Posters, hoardings, stickers and folders with multi colour pictures abounded as were video films on literacy and even films. All they could do was to start a debate among the officials and non officials engaged in TLC to compare relative merits and find out which district scored better. While road side posters and hoardings gave a sense of elation among the district-level organisers the literate passers-by looked amusingly at them and contrived a number of popular jokes. The hapless illiterates for whom they were meant primarily could only stare vacantly at them and count the enormity of expenses that might have gone behind those materials. Cultural 'jathas' offered temporary employment to groups of

hudding artistes and gave them captive audiences which otherwise they would not get. There was indeed a 'cultural revolution' throughout the state with literacy as focus point but audiences were largely rural (rural urban elites who would come in drove with their families to see their loved one flourishing on the stage for the first time courtesy some benevolent organisers of TLC). Prospective learners remained conspicuously absent because they had hardly any time to spend an evening for non-productive purposes. Nor was there an conscious attempt to make them participate or to find out the impact of such programme on the campaign. Knowing that such programmes have limited utility, NLM nonetheless promoted such groups of artists only to give themselves an aura of respectability which association with premier cultural organisations normally bestowed. Similarly the rich crop of video film remained collectors' delight and score competition points among the districts. But they were seldom used in motivational campaigns due to non-availability of video sets in remote rural areas. Even when such contraptions were available through the good offices of local video parlours, the showrooms were crowded more with the organisers and their admirers than with the learners. Moreover the small screens with over used VCP/VCRs could not present attractive spectacles to communicate simple messages, much less motivate.

Survey. The fifth basic feature of TLC was comprehensive survey of the population to find out actual illiterate population in the 9-50 age group not delineated in the census, to find out prospective learners and also to find out peoples who are willing to take up various jobs necessary for launching of the campaign. The survey during which organisers would have the first opportunity to interact with prospective learners directly was also deemed to be the starting point of motivation campaign. Although this idea came late in the day and there were no guidelines from the NLM or state authorities.

TABLE I. DISTRICTWISE COST PER LEARNER FOR TLC

Name of the District	Amount Spent (in Lakh)	No of Persons Made Literate (in Lakh)	Cost/ Learner (Rupees)
Midnapur	900	8.58	104.90
Burdwan	500	9.87	50.63
Hooghly	483	5.73	84.20
Birbhum	335.36	6.08	55.15
Bankura	439.05	4.99	87.98
North 24 Parganas	558.70	6.22	89.82
Cooch behar	346.50	2.95	117.47

to consider survey as a springboard for motivation campaign, enlightened and all-knowing heads of district literacy campaigns should have thought it ahead of others. Paradoxically survey which should have been utilised as the formidable initial tool for launching TLC, it was done in most perfunctory manner. As a result, findings of the survey not only could not produce expected by products to help the campaign, it failed to achieve its primary objective of estimating the number of illiterates required to be covered by the campaign. In at least two districts North 24-Parganas and Howrah survey has had to be conducted repeatedly to bridge the yawning gap between the survey figures and figures available through interpolation of census data. Table 2 shows the extent of discrepancies in selected districts.

While estimation based on 1991 Census was calculated by me using age-wise proportion of 1981 Census the survey figures were quoted from the status report referred to earlier. Astonishingly, estimations calculated by me and estimation done in individual project furnished by the districts to the NLMA for funds were similar to a large extent thus lending authenticity to my calculations. Unfortunately, most of the districts later retracted their estimations based on the survey conducted by them. While cases like Burdwan, Midnapur, Hooghly, Birbhum and Bankura can be accepted as natural as they had to exclude 51-59 age group from their earlier estimation and some differences between census and survey is plausible in remaining cases differences are too big to be accepted without further investigations. The TLC districts of North and South 24-Parganas and Howrah have adopted an intriguing approach towards these statistical *faux pas*. While North 24-Parganas straightforwardly discarded the census statistics on literacy and held its own survey faultless, Howrah did not offer any reason for retracting its earlier estimation based on their own survey which found illiterate population to be around 6.5 lakh, somewhat nearer to our estimations. There ensued a long debate between the NLMA and the above two districts who got their funds sanctioned on the basis of greater number of illiterates mentioned in their project reports. In both the cases the NLMA had to relent thus giving a free hand to the district literacy committees to fudge the vital statistics. Minor implication of such discrepancies were that the district literacy authorities of North 24-Parganas were saddled with about 4 lakh primer I which they had printed on the basis of their earlier estimation but found no takers and had, therefore, serious problem of disposal. This problem was also faced by the Birbhum TLC authorities who had to dispose of

more than 2 lakh primers to some other districts who had adopted TLC later.

But the serious implication lies elsewhere. To begin with let us quote verbatim from the status report (July, 1994) of the DAE. It states "North 24 Parganas (TLC) was sanctioned in January 1991 to cover 17 lakh illiterates in the age-group 9-50. Against the proposed coverage of 17 lakh, the survey results showed 10 lakh illiterates and all learners were enrolled out of whom 6.72 lakh learners achieved level II." Now, in West Bengal level II is equivalent to competencies prescribed for full NLM norms and is therefore entitled to declare the learners as literates. The district indeed declared itself fully literate with much fanfare. Now, if the district indeed had an illiterate population of 17 lakh, or even 15/16 lakh as estimated by us the percentage of illiterate person made literate would come down to 39.5 per cent for 17 lakh illiterates and 48.8 per cent in case we accept our calculation of 15 lakh. In no case it could be 82 per cent as claimed by the district. Besides this, the status report itself mentions two figures of 67.2 per cent and 82 per cent, the former calculated from the simple arithmetic of 6.72 lakh learners achieving level II out of 10 lakh enrolled and the latter available from external evaluation report. The DAE status report did not however explain this discrepancy.

The implication is that almost 8 to 10 lakh illiterate persons remained uncovered even after the district was declared fully literate. There would be no literacy efforts for them in the foreseeable future at least till the ZSSs rule the roost. Similar is the case with Howrah and some other districts. This phenomenon would continue to haunt us till the 2001 Census but then most of us would not be here to witness the confusion. To the question of whether these discrepancies between plausible figures and survey results were natural or deliberate some diehard critics of TLC told me that illiteracy figures were kept deliberately low with a view to show maximum achievement in the rat race among the district collectors. While it would be improper to be swayed by such cynical apprehensions of diehard critics, there is need for further investigation into this weird phenomenon. Admitting that census figures are not sacrosanct, the survey results cannot be accepted without a pinch of salt. There is no reason to believe that data thrown by survey were more accurate to the census data if we look at the manner in which the surveys were conducted in various TLC districts. In most cases no systematic training was given to the survey enumerators and there was neither proper supervision of their work nor any cross-checking was done to evaluate the reliability of the data collected by the voluntary enumerators. Moreover, the poor

machinery of TLC survey could not match those of the census operations which not only have experience and expertise in these kinds of works but also have an elaborate machinery for training and cross-checking. Yet the literacy data of the census is suspect because it has a very simple definition of 'literate' person and was liberal in enumerating a person literate. Logically the TLC surveys should have found more illiterates. But the reverse has happened. All these factors portend ill for our literacy status and put a legitimate question mark on the achievement of the campaign.

POST LITERACY

The factor which undid the TLC was the post-literacy phase. The concept of post-literacy is peculiar to India and has been in vogue since the beginning of literacy campaigns in the country from the 1950s. But earlier, it was well conceived and planned and ritually followed literacy campaigns. For the planners of TLC, however, the idea of post-literacy did not occur initially and it was added as an afterthought. As a result no uniform post-literacy strategy was developed by the NLMA till recently. West

TABLE 2 DISTRICTWISE ILLITERATES ACCORDING TO CENSUS AND TLC SURVEY
(in lakhs)

Name of the District	No of Illiterates in 10-59 Age Group (1991 Census)	No of Illiterates in 9+ 50 Age Group as per District Survey
Howrah	9.58	4.64
North 24 Parganas	16.19	10.00
South 24 Parganas	17.63	13.48
Nadia	12.15	7.75
Murshidabad	20.02	12.73
Malda	11.55	5.32
Burdwan	14.89	12.00
Hooghly	9.08	8.03
Midnapur	17.18	16.46
Cooch behar	7.90	5.37
Bankura	9.05	7.43
Purulia	8.44	5.74
Birbhum	9.02	7.30

TABLE 3 STATUS OF POST LITERACY PROGRAMMES IN WEST BENGAL

Name of the District	Proposed No of Neo Literates	Actual No Enrolled	Actual No Attending
Burdwan	10.89	8.03	1.45
Birbhum	6.04	4.96	4.68
Bankura	5.00	NA	NA
Midnapur	8.58	3.46	3.36
Cooch-behar	2.95	0.83	NA
North 24 Parganas	8.92	8.06	4.05

Bengal has however drawn up a strategy quite early but could not enforce the same on the ZSSs who on the plea of having an independent post-literacy policy undertook some patchy programmes having little impact on the overall literacy situations in their respective areas.

The concept of post-literacy is not only unique but it appears to be a deception. Literally, post-literacy can mean anything taken up after the literacy phase but in practice it is continuation of the literacy phase as stated earlier. If the norms recommended by the NLMA are achieved during the literacy phase itself as it should have been, 90 per cent of the objectives set out in the so-called post-literacy programmes would become redundant. Post-literacy would then turn out to be 'continuing education' programme, which is an essential input of any literacy campaign worth its name. But none of the TLC districts could bring their learners to levels prescribed by the NLM. TLCs produced extremely fragile levels of literacy which cannot survive even for a month in the absence of continuing programmes of literacy. The expert group headed by Arun Ghosh was candid when it stated, "There is a real fragility in literacy achievements and thus very serious problems of relapse of neo-literates even in districts where there have been successful TLCs". According to S Banerji, "There are two aspects of the problem. One, the possibility of relapse into illiteracy after a certain period. Two, the inadequate acquisition – or even complete absence – of the skills of literacy among those who had been learning under the TLCs during the last two or three years" [Banerji 1994]. While the former aspect could be remedied by providing arrangements for continuing education through supply of adequate numbers of reading materials and development of library services or even by organising distant learning courses, the latter has no known remedy other than extending the literacy phase till all learners learn adequately. That TLCs of West Bengal suffer from the second problem is borne out by the contents of thousands of post cards mailed by the 'neo-literates' to the district and state authorities, by the answer-scripts of both internal and external evaluations and by examination of the primers themselves where the learners have left indelible evidence of their learning standards. Furthermore, the question papers set by various districts, both for internal and external evaluations, have been much below the NLM norms and guidance given to the examiners diluted the norms even further. Now, a learner achieving 70 per cent of these questions with a liberal marking system could ensure only self-congratulatory outcomes which could hardly form the basis of declarations.

Banerji, who has done considerable field work in West Bengal could not therefore ignore the 'fears about this fragility' when he remarked that, "In fact, fears about this fragility had been expressed all these years by several observers who questioned the tall claims of 'total literacy' made by the target-obsessed bureaucrats of the HRD ministry keen to sweep the 'fragility' under the carpet. Allegations about fudging of figures to claim total literacy, misgivings about the mode of evaluation of literacy programme and examination of learners, complaints about administrative pressures to reach the target – all these had been expressed both by academicians and journalists who visited some of the districts under TLCs" [Banerji 1994].

Knowing well these problems but lacking the courage to express, the enlightened bureaucrats of West Bengal took shelter under the vague umbrella of post-literacy which they had defined in their own way to atone for the failure of TLCs. Hence, Burdwan, Midnapur and Birbhum devised a 'bridge course' where part-III of the basic primer of IPCL method was introduced to complete the three-part lessons meant for the literacy phase alone. Then, they embarked upon the so-called 'post-literacy' with reading materials not much different from the 3rd part of the primer. Along with these programmes also ran conventional literacy programmes for the so-called 'left-outs'. Added to these multipurpose literacy programmes were the 'Janasiksha Nilayams' in Burdwan district for continuing education and district resource units (DRUs) in three districts. In this way some of the leading districts of West Bengal could show their continued concern for literacy and could perpetuate the ZSSs with their substantial funds at the call of cash-starved district administration. Even these contraptions could have offered some benefits had they been executed with imagination and finesse. But failure to gauge 'VT fatigue' and gradual withdrawal of political support coupled with fatigue-borne indifference of official and non-official workers killed the post-literacy efforts in the launching stage itself. Several attempts by the ZSSs to resuscitate the programme led only to brief flutters of life here and there before they became permanently still. The report compiled by the DAE for National Overview published in December, 1994 eloquently tells the story of post-literacy programme in West Bengal. Table 3 gives the details of the report.

It appears from the report that except for Birbhum, remaining five districts are far from their targets. While Bankura is yet to evolve a MIS for PLP, Cooch-behar is not interested in collecting attendance reports lest they show the ZSSs in poorer light than

the poor enrolment data. The only consolation West Bengal can get from this sordid picture is that countrywide the situation is no better. Prefacing the post-literacy report the DAE says, "The current status of post-literacy phase appears to be very grim which is a cause of great concern. The major problem with post-literacy projects are: poor reporting, high dropout rate and very poor participation of the neo-literates". West Bengal has a participation rate of only 34 per cent as against 62.29 per cent in Tamil Nadu and 58.79 per cent in Gujarat. The conclusion derived from the above report is that more than 60 per cent of the neo-literates could not be brought under post-literacy umbrella and consequently, have to be written off as wastage. This will have serious implication on the literacy status of the state besides pushing up cost per learner still further.

Being claimed as a politically conscious state, one would expect some ideological content in the literacy programme. In fact, strong presence of ideological content in literacy campaigns of many third world countries like Cuba, Vietnam, Tanzania, Nicaragua and, even our southern neighbour Sri Lanka, ensured their considerable success. Although functional aspects like health and sanitation were tagged with literacy in some of the districts which also included universal primary education as one of their social goals, no specific ideological or social issues were thrown up in any of the districts of West Bengal. In fact, Arun Ghosh committee's commendations about TLCs' ability to engineer 'social development' was challenged by S Banerji. After narrating an incident he learnt in a Burdwan village, Banerji concludes, "The incident – not an isolated one, as I discovered in some other villages in Burdwan – give the lie to the glib official claim that communally potential incidents are nipped in the bud by the villagers (who are presumably made neo-literates by the TLCs)" [Banerji 1994].

In Memory of Gobinda Mukhoty

Sumanta Banerjee

Gobinda Mukhoty will be remembered for his success in hollowing out a foothold for the dispossessed in the solid conservative trunk of the Indian judiciary.

THOSE who were his colleagues in his profession are in a better position to pay tribute to his legal acumen. My homage to him is from a position of a communist who joined the democratic rights movement soon after release from jail and the lifting of the Emergency, followed by the general elections, in mid-1977. Those were difficult times, with many of our comrades still behind bars, and the newly installed Janata government refusing to release them on the plea that they had indulged in violence.

In those days, Gobinda Mukhoty came to represent and revive the best of the old liberal humanist tradition, which had got lost somewhere along the line during the intellectual odyssey of the Indian middle classes since independence. It was his commitment to this tradition that he inherited which opened up a wide space in the democratic rights and civil liberties movement for dissidents, and the various oppressed sections of our people – ranging from Naxalite activists of Andhra Pradesh to Naga secessionist fighters, from unorganised workers in construction sites of Delhi to bonded labourers in Haryana. His impassioned arguments before the Supreme Court on their behalf – with him bearing the cost of many of these cases – bore the stamp of the liberal humanist values with which he grew up in the late 1940s as a Presidency College student in Calcutta (where today, sadly enough, those values seem to be on the retreat), and later as a student of law in the UK. After a stint as a teacher in Calcutta's St Xavier's College, he began to practise as a lawyer in the Supreme Court in 1971, where he was designated a senior advocate in 1984.

I remember having met him first in mid-1977 in Delhi's Gandhi Peace Foundation at a meeting of the then People's Union for Civil Liberties and Democratic Rights (PUCLDR). The heavyweights from the established political parties, ranging from the Janata and the Jana Sangh (the ancestor of today's BJP) to the CPI(M), who dominated the meeting, tried their best to throttle the demand made by some of us for the release of all political prisoners including the Naxalites and Naga and Mizo

secessionists, on the plea that while the former were 'criminal', the latter were 'anti-national'. Gobinda Mukhoty took a firm stand and agreed with us on insisting that any movement launched at that moment must aim at restoring, protecting and extending the civil liberties and democratic rights of the Indian people. The restoration of these rights could be possible only with the release of all political prisoners, repeal of MISA, DIR and other such laws, end to police and military atrocities in different parts of the country, and denotification of 'disturbed' areas, among other things.

His readiness to share these concerns of ours – and his assertive articulation of these demands – naturally made us gravitate towards him. The activists of the democratic rights movement in Delhi converged around him and the Delhi state unit of the PUCLDR under his leadership organised the convention on Political Prisoners and Civil Liberties in the capital on August 20-21, 1977 – the first of its kind in post-independence India. The recommendations he made in a paper on jail reforms that he submitted at the convention were of far-reaching implications – although unfortunately few of them were followed up.

Gobinda Mukhoty's role in the Indian human rights movement was tied up with a basic debate – a debate between two trends: one favouring concentration on only the civil rights of the citizens, the other stressing extension to the democratic rights of peasants and workers and militant activists fighting for their demands. To briefly recapitulate the background, soon after the Janata Party came to power in 1977, the PUCLDR national body became almost defunct, with its leaders (mainly drawn from the different non-Congress political parties) presumably assuming that now that they were in power at the centre, there was no need for any movement for ensuring civil liberties and democratic rights. The Delhi state unit of PUCLDR alone not only continued to fight on the old issues that were a legacy from the Emergency period (e.g. release of political prisoners, and to police brutalities and 'false encounters', etc) but also exposed cases of human rights violation in the new Janata-ruled states (e.g. communal riots in Aligarh

on October 5, 1978). Soon after the Congress came back to power, the national body of the PUCLDR was revived in 1980 (it came to be known as People's Union for Civil Liberties). We in the old Delhi unit, headed by Gobinda Mukhoty, had in the meantime expanded our activities beyond issues of civil liberties in general to those of economic rights and political demands of unorganised workers, tribal peasants and other oppressed and deprived sections of the people in particular. As we felt that the PUCL might not provide enough space for such activities, we chose to maintain an independent status as People's Union for Democratic Rights (PUDR), separate from the national PUCL, although we proposed to collaborate with PUCL whenever necessary (as we did in bringing out the report 'Who Are the Guilty?' after the massacre of Sikhs in 1984). It had been a history of happy collaboration.

It was with the formation of the PUDR in 1981 that Gobinda Mukhoty really came into his own, and his role in the human rights movement acquired a distinct character. He will be remembered for his success in hollowing out a foothold for the dispossessed in the solid conservative trunk of the Indian judiciary. He was at his best in making use of the laws and steering the arguments in a direction as to tease out from reluctant courts concessions for the underprivileged – whether migrant labourers working in ASIAD, or victims of police and landlord oppression in Andhra Pradesh. It was primarily due to his persistent and patient efforts that public interest litigation came to be recognised as a legitimate weapon in the hands of the poor seeking justice.

Enthusiastically fervent in his responses to requests for intervention from every quarter, he would often take decisions that sometimes landed us in awkward situations. But affectionate and understanding as he always was, he could soon remove all traces of misunderstanding and tide over whatever minor crises that might have been caused, by his affable charm.

Essentially, it was his uncompromising stand on defending the democratic rights of the underprivileged and opposing the Indian state's draconian laws that suppressed those rights – both in the Supreme Court and outside in numerous conventions and mass meetings on human rights in far-flung corners of the country – that will endear his memory not only to his close comrades-in-arms of the PUDR, but far beyond among the generation of young lawyers and activists who have been inspired by him, and upon whose shoulders falls today the mantle of Gobinda Mukhoty's brief.

Religion, State and Secularism

Irfan Engineer

Secularism should not mean equal encouragement to fundamentalism of all communities. To reject this version of secularism, the ruling classes whose interests it serves need to be defeated.

THE recent rise of communal fervor around the Ram Janmabhoomi-Babri masjid controversy and the consequent demolition of the Babri masjid by Hindu communal fanatics shook many from their complacency. The power of religion to fanaticise millions and mobilise them on streets instilled with fury shocked all secularists. A debate was generated and existing theories of secularism were challenged. The debate helped deepening our understanding of the term in order to apply it to Indian situation. Some felt that though communalism is a serious problem, secularism will not work in Indian conditions and the rise of communal fervor is rather a reaction to attempts by the state to impose secularism on the masses [Madan 1987, Nandy 1990]. The ultra left opinion, on the other hand, is that the Indian state itself is communal and acts on behalf of the Hindu communal forces [Reddy 1993, Kumar 1993]. There are various shades of opinion between these two extremes. Some consider the BJP and the Sangh parivar to be communal while others look upon the Congress as equally communal. The Sangh parivar calls the left as well as the Congress as pseudo-secularists and accuses them of appeasing the minorities in order to use them as vote banks. Constitutional and judicial experts have elaborated upon secularism while sociologists have written on religion and secularisation in Indian society. These discourses no doubt give valuable insights, and contribute towards developing a theory on secularism. Without understanding the role of religion, a proper understanding of secularism in India is unimaginable.

RELIGION: DOUBLE-EDGED SWORD

It was predicted that the hold of religion will wane in the post-industrial period. Notwithstanding such predictions, religion continues to have its sway in the present global arena, not only in the backward countries of the third world but also in the advanced countries of the first world. The imperialistic world order has led to concentration of global wealth into few hands. The reactionary ruling classes of the resource rich third world countries are fully backed by the imperialist to repress their people and brutally crush any challenge to the world order. Of course, the reactionary ruling classes of the third world countries do get some crumbs and opportunities to amass wealth out of the toil of their people and the natural resources within their

territory. This has led to a decadent consumerist culture and values, which is evident from the disproportionate growth of service industries, five star culture, womanising, drug industry, gambling, casinos, and what not. It has led to alienation, individualism, racism and above all dehumanisation. High suicide rates are but a manifestation of this phenomena. However, even drugs, and consumerism failed to provide solace to the alienated mortals. They started turning towards religion of Osho Rajneesh and ISKCON variety or towards movements led by Catholic churches against abortion. This is the form of religious revivalism in the first world.

Those who migrate from the third world to the first world in search of greener pastures, after receiving education on resources generated by their country, find themselves as targets of racism. Unable to give up the greener pastures, they too turn towards religious revivalism and finance revivalist movements of their home country.

The regimes of the third world country have not completely outgrown the habits and practices of medieval ages. They seek religious sanction for their hegemonic and repressive dictatorships. The religious establishments, too, eagerly extend their support to these regimes and India has been no exception to this process. However, religion is not to be solely blamed. Though fear resulted in the origin of belief in the existence of some supernatural power, religion in the proper sense evolved only could the human society produce surplus and a class of people who lived off it. Such religion, needless to say, justified such appropriation and called upon the labouring class to work harder to achieve their salvation. Such religions help maintain status quo.

However, as the crisis within the system deepens, forces of change emerge from the womb of the old society. A new religion may gain currency that supports the call for change giving birth to new values and philosophy. Christianity as well as Islam are examples of such religion, enshrining values of equality. However, once the old, exploitative order was overthrown, the new versions of religion became new establishments. Christianity had to face challenges from the rising capitalist class. This class dealt heavy blows to the church and the feudal classes in western Europe. Nevertheless, religion did have new utilities for the merchants and the imperial bourgeoisie who were in constant

search of new markets. Missionaries accompanied the merchants to 'civilise' the 'barbarians' of Asia, Africa and Latin America and lent legitimacy to the colonisation process. The toiling masses of the colonised world as well as the working classes fighting for their liberation resurrected the original spirit of Christianity. Liberation theology emerged out of these efforts. Thus religion by itself is not reactionary or progressive. Its nature depends on the section which employ it as an instrument to further its interests.

Whosoever may be employing the service of religion, one thing is clear that religion is deeply entrenched in the psychology of the masses. It will not be easy, at least in the near future, to do away with it. People have always understood the cosmos, universes as well as the purpose of their existence through the medium of religion. Whenever there is a feeling of insecurity and uncertainty in life, one turns towards religion for solace.

In order to perpetuate its hegemony over the masses, the church in the west had to oppose new scientific discoveries. Science with the backing of the newly emerging bourgeoisie, not only won the battle, but also revolutionised people's lives. Bourgeoisie, the ruling classes in the west, no more required the crutches of organised religion to maintain its hegemony over the rest of the society. This process led to the secularisation of the society.

Scientific knowledge that was emerging on the Indian soil was suppressed by the British colonialists. The knowledge base of the communities was systematically destroyed and a deluge of imperialist goods and services were dumped on the Indian soil. In India, religion was never confronted by science and renaissance. Not only the science was never employed into the service of toiling masses. The western technological solutions that multiply the profits of the comprador bourgeoisie have led to many big projects that result in eviction and displacement of millions thus increasing the problems rather than solving them. In the name of science and modernisation, western technology was imposed on us from above. In such situation, can one dream of importing secularism as it developed in the west? Will it be meaningful for the masses? It is doubtful. However, this does not mean that our country should not be secular and religion should dictate its politics. The crucial question is what kind of secularism and in what form. As Manoranjan Mohanty has pointed out secularism can be of two varieties; hegemonic and democratic.

MINORITY FUNDAMENTALISM TO MAJORITY COMMUNALISM

Religion being deep rooted in India, has been utilised by the both – the ruling classes as well as forces that want to change the status quo. The first widespread anti-British

sepoys' mutiny was sparked off on account of discontent on religious grounds in 1857. Almost all tribal revolts against the British rule, before and after 1857, expressed themselves in religious idioms. The Wahabi movement and the Farzi movement in Bengal, before the 1857 rebellion, were essentially anti-British movements. Further back in history, prior to the British domination of the subcontinent, social discontents were expressed through Bhakti and Sufi movements. The Indian National Congress did not have a popular base in the initial years. The extremists within the Congress in order to mobilise the people started addressing them in religious idiom. Tilak launched Ganeshotsav and Shiv Jayanti. Later, Gandhiji employed religious idioms — whether it was Khilafat movement or his support to the Gurudwara Reform Movement of the Akalis. Communal parties like the Muslim League, the RSS and the Hindu Mahasabha utilised religion for their communal politics. Thus, while the Britishers sought to perpetuate their policy of divide and rule on communal lines, the Congress used religion to rally people behind its demands that were otherwise secular, and the communalists resorted to religion to gain legitimacy for their communal demands and political gains.

In the post-1947 period, there is hardly any major parliamentary political party which has not used religious symbols and idioms for purely electoral purposes and patronised certain communal elements. Whatever, growth the economy has registered over years, has been at the expense and impoverishment of the toiling masses. With worsening conditions of the poor, their disillusionment with political parties has been growing. As a result, political parties come up with deceptive slogans and issues to divert the attention of the people from their miserable existence. The major parliamentary parties basically represent the interests of the ruling classes and depend on them for their support. Therefore, their political and economic programme is of a very limited spectrum. In order to differentiate amongst themselves and create their exclusive vote banks, they resort to linguistic, regional, religious identities which leads to polarisation among the masses.

The Congress is an old hand at this game. In order to create Muslim vote banks, it always appeased the fundamentalists of the community and agreed to all their religious demands while ignoring the basic issues of Muslims that would enable their political participation and economic and cultural development. On the contrary, the Muslim masses were discriminated against in political and economic field. They endured a severe backlash in the riots from the police as well as the majority community whose passions

were roused by rumours and false propaganda.

The Shah Bano and ban on *Satanic Verses* are recent examples of appeasement of the fundamentalist sections within the community. In 1989, V P Singh visited Jama masjid and persuaded Imam Bukhari to issue an edict to the Muslims to vote for the Janata Dal. The reformists within the Bohra community are struggling for their human and democratic rights which are curbed by the authoritarian high priest, the Sayedna. The reformists are demanding that a bill be brought against the practice of social boycott on the lines of banning of the untouchability. When the reformists demanded in the states where the BJP had come to power, to bring legislation to ban social boycott issued by the high priest, even BJP governments turned cold in their feet.

wooing the minority fundamentalists may get the votes of those communities but it is not sufficient to capture power. Therefore, caste formulas are worked out on KHAM and AJGAR lines. Only those casteist demands are agreed to which do not disturb the status quo or cause distribution of economic resources and political power. The toiling masses are left high and dry.

Not all fundamentalists remained under control all the time. Some in their zeal to outdo other sections of the fundamentalists demanded more than was due to them in the scheme of things conceived by the ruling classes. But the ruling parties could turn even this to their advantage. If Bhindranwale have exceeded their brief, the situation can be turned to the advantage by appealing to majority communalism. Instead of caste-wise vote banks, now attempts are made to convert the majority community as a whole into a vote bank by talking about the danger of fundamentalism of the other minority communities. Since early 1980s fundamentalism of the majority community is being wooed by giving in to their demands — sending army to the Golden Temple in Amritsar, 1984 anti-Sikh pogroms, breaking the seal over the disputed area Ayodhya and then allowing the Babri masjid to be demolished. In riots the police and fundamentalist vandals from majority community are let loose on the minorities. The fundamentalists of the majority community are not even touched for delivering rabid public speeches and the minority is made to feel helpless and powerless.

DEMOCRATISING SECULARISM

It is puzzling to argue that state is trying to 'impose' secularism on the Indian people. Every state transport bus has photos of deities or shlokas pasted on it. Every PM and CM visits religious places. The first thing that the smugglers and the black marketeers think

of is investing their booty in the places of worship. However, it is difficult to comprehend that the Indian state is a Hindu communal state. India is not a Hindu rashtra, as yet.

Though there is hardly any dispute within democratic circles regarding secular Indian state, secularism should be understood in the Indian context. In the west, the term 'secular' was a result of struggle between the rising bourgeoisie and the feudal church. As the church sided with the feudal elements against the revolutionary forces of the time, it got isolated and people's faith in religion and religious institutions was shaken.

In India, the term secularism was first used when the Congress was accused of being a Hindu communal party by Sir Sayed. The defence of the Congress was that it were a secular rather than a Hindu communal party. This meant that the Congress did not represent any one community. In fact, the Congress used the religious symbols of all communities to mobilise them in the freedom struggle. It always claimed to represent the cause of 'Indian' nationalism as against the communal nationalism of the Muslim League or of the Hindu Mahasabha and the RSS. Indian nationalism nevertheless predominantly drew upon the culture and values of the upper caste of north Indians with which the southerners, the minorities, the SCs, the STs and the OBCs could not identify. Indian nationalism did not have any common culture or language. The only thing common was its opposition to the dominance of the British imperialists. After 1947 Indian nationalism could be defined only as a sort of anti-thesis to the 'Pakistani or Muslim nationalism'. The Indian (read Hindu upper caste) nationalist would dread to think what would happen if the map of Pakistan was scrubbed off the face of the globe? How would India survive and what would keep it undivided?

The secularism of the Indian ruling class has meant that fundamentalism of not just one community but of all communities should be equally encouraged. This has resulted not only in the rise of fundamentalism in the country but also in armed separatist movements in the north-east, Assam, Punjab and Kashmir. Political parties are left with limited options. They cannot do without religion to consolidate their hold over the masses and therefore need the fundamentalists.

The meaningful interpretation and application of the term secularism is certainly not an easy task. It is not a question of defining it on paper and deriving satisfaction out of it. The struggle for defining 'secularism' is a struggle for establishing secular state and secularising civil society. It is therefore difficult to visualise any blueprint of Indian secularism. Nevertheless it might be possible to set out some broad parameters. First and foremost,

Indian secularism should mean non-religiousness rather than anti religiousness of state and polity. This means that people should reject any politics which attempts to encourage or discourage any religion or interfere in any religious practices. Religion and religious institutions should be discouraged from supporting political parties. Everybody should respect the right of the other to follow any religion and also the right not to follow any religion. The state would be empowered to regulate the secular activities of a religious trusts and charitable institutions. Secularism does not mean merely separation of state and religion but also that the state would not interfere in any community and would allow all identities to grow and develop without coming in conflict with each other. If true and democratic secularism has to succeed the present hegemonistic secularism which has come to mean equal respect for fundamentalists of all religion has to be rejected and defeated. That may not be possible without defeating the class that is behind such secularism and whose purpose it serves. Thus the struggle for establishing democratic secularism has also to be a struggle for social change. Since the ruling classes derive their legitimacy and backing from the imperialists the struggle for

secular change will also be opposed by the global powers that be. The struggle for secularism has to be in that respect part and parcel of global struggle against the hegemony of the first world.

Cultural pluralism and encouraging democratic culture of every community would go a long way in inculcating tolerant democratic and secular values. In other words culture for democratic struggle and struggle for democratic culture can build secular consciousness amongst the toiling majority that would not permit non-secular hegemonistic tendencies to operate.

referring to it. Moreover, they have sought to divert the issue by voicing the devadasi system in Orissa as different from other regions of India. On the contrary, a Pur devadasi who leads a 'vegetarian life as kept woman' of Jagannatha, symbolises degradation of women as much as prostitute devadasi of Karnataka. Whereas the attempt to harp on tradition sidelines the present, a comparison with the alleged system in Karnataka seeks to romanticise and glorify the devadasi system in Orissa. Most importantly issues related to gender are completely ignored while these obscurantist positions are asserted. What has thus emerged as a tradition/modernity issue needs to be re-located as a contest between the structure of brahminical patriarchy, under the aegis of a democratically elected government and the forces of democracy/humanism and the rule of law. Of course one can question the democratic credentials of the Orissa government since it has dissolved all the elected urban bodies and the rural panchayats within months of coming to power. Given this context, a clear connection between the state government's authoritarian credentials, opportunism and its attempt to draw legitimacy from patriarchy is evident.

What is equally intriguing is the hold of patriarchy on women. There were six applicants for the interview. This raises questions not only for those associated with the democratic feminist movement but also for those committed to development and progress. All the applicants are educated. One of them is a teacher in a primary school, another works for a voluntary organisation, yet another is an instructor in a government training institute for women. This reveals the self-imposed fetters on women who instead of challenging brahminical patriarchy legitimise it by such voluntary acts. But the most despicable aspect of the whole affair was the expectation that the devadasis should dance provocatively to satisfy Lord Jagannatha before his bedtime. Three of the six candidates who reported for the interview expressed their disinterest in the job once they came to know the meagre cash payment of Rs 30 per day.

The Janata Dal and the left parties in Orissa besides several women's organisations in and outside the state registered protest. What might have seemed to be a tide might well turn against the ruling party in Orissa. It is tempting to recall the first elections in Orissa held in 1937. The landlord of Kanika had hoped to get the support of the electorate by seeking their pledges on the 'mahaprasad' of Jagannatha. As reported, the voters bowed to the 'mahaprasad' but dropped their ballot in the Congress box. However, given the state of affairs it will be too much to expect the Congress(I) to learn from history.

Of Devadasis, 'Tradition' and Politics

Biswamoy Pati

Under the garb of tradition the attempt to keep alive the devadasi system at Jagannath Puri is another instance of gender injustice in Orissa

SEPTEMBER 11, 1995 will go down in history as Orissa's black day as reports of an interview to select a devadasi for the Jagannatha temple at Puri appeared in the media. Fixed at a time when the Beijing conference was in session this incident raises many questions about our so-called journey into the 21st century. The fact that the management of the Puri temple is under the state government since 1960 makes the situation both intriguing and ridiculous. What is striking is that the idea of holding such an interview is about seven years old. Moreover, the silence of the Congress(I) government regarding the matter makes it a party to the happenings. After all, the decision to call suitable candidates for the interview was taken during Janaki Ballav Patnaik's previous tenure as chief minister. Electoral considerations with the 1996 general elections round the corner, seem to have a distinct bearing on this feature.

The devadasi issue needs also to be located in the context of Orissa where gender-related violence has assumed alarming proportions. Transcending the barriers of caste and region, dowry deaths and harassment of women has increased. The state has the dubious distinction of leading the country's statistics on this account. Additionally, there are other forms of violence unleashed by patriarchy and legitimised and reinforced by an insensitive bureaucracy. How else does one explain an ex-police DG's view that rape is not a crime, or one of his successors torturing his daughter-in-law over dowry? Given this discrimination, Jayanti Patnaik's wife should be the chairperson of the National Commission of Women, is indeed ironical.

The administrators at Puri have projected the issue as linked with 'tradition'. The temple administrator and the Puri collector, both invoking tradition while

Art and Life in America

The Trial of O J Simpson

Carol Upadhyia

The trial of O J Simpson was broadcast like a soap opera but ended like a football match, with blacks and whites cheering opposing sides. Why did this happen? The racial tension that it generated had something to do with already existing racial divisions and inequalities in American society, but much more to do with the way in which the case was projected and produced by the media. The transformation of a murder trial into a race issue is but one example of the increasing control which the media exerts over the terms of public discourse in the US

AS the trial of O J Simpson (ex-football star, television personality and probably the most famous person in America ever to go on trial for murder) for the brutal killings of his ex-wife and her male friend ground on for nine months, it began to look more like a long running TV soap opera than real life. Millions of Americans watched the proceedings on TV which were covered exhaustively by CNN, and an estimated 135 million people, or half the population, are thought to have watched or heard the verdict which was carried live by all the major networks and cable channels (during which time advertising slots reportedly were sold at five times the normal price). With all of the interest generated by media hype, the case became a spectacle in which many of the tensions and contradictions of life in the US (1995) were articulated and projected in black and white on to a large screen. As the verdict of 'not guilty' was read out, reports say, most whites reacted with dismay while many blacks cheered. Thus in the end the trial was transformed from a TV drama into a football game with blacks and whites largely championing opposing sides.

Why did this happen? How did this court case, in which a man who was proven to have physically abused his wife was being tried for her murder, turn into a major public issue with race at its core? This question is difficult to answer, and there are several levels at which one can understand the phenomenon.

At one level, it appears that blacks and whites perceived the O J case in entirely different ways from the very beginning. Whites focused on the domestic violence issue and saw O J as a brutal dominating black man who used to beat and eventually killed his (white) wife. They feared he would be acquitted because of his ability to buy the best defence and the sympathy of the jury (with a majority of non-white members). For blacks, it was not simply a matter of supporting a fellow black out of a feeling of solidarity. Based on their own experience of being black in the US, they saw O J as yet another black man victimised by a criminal justice system that is designed to condemn black men and in which they can

never get fair treatment, and they feared he would be convicted because of his colour.

A view that was only reinforced by the evidence about the conduct of the police (LAPD) that was dug up by the defence. The support by blacks for O J may also have been a reaction to the fact that most whites assumed that he was guilty. Even one month after his arrest, before the trial had begun and the mountain of evidence had been piled up, according to one poll, 68 per cent of whites thought he was probably guilty while only 24 per cent of blacks did so. The proportions did not change much after the trial – one third of whites but 85 per cent of blacks agreed with the verdict. The reactions to the verdict further indicate the depth of the racial divide. For many whites it was a travesty of justice because they assumed that O J was guilty but had manipulated the system, through the use of money and the 'race card', to get off. But many blacks rejoiced to see a black man beat the system the same way rich white guys have always been able to do.

The fact that the evidence, and rules of evidence in criminal cases, mattered little in most people's opinions about O J's guilt further indicates the extent to which the case was politicised. Given the cases presented to them (and contrary to majority opinion), the jury reached an entirely fair verdict. (That an all-white jury would have reached an entirely different verdict is a foregone conclusion that no one wants to talk about, even while accusing the black majority jury of 'reverse racism'.) What was indeed surprising, given the weakness of the prosecution's case, was that most observers predicted a long deliberation and a 'hung' jury. In the end, the jury spent only four hours in deliberation over 45,000 pages of testimony and 1,015 pieces of evidence. Based on what several jurors have said afterwards, it appears they were swayed not so much by the 'race card' as by the doubt cast on the evidence by the defence. The point is not whether they thought O J was actually guilty, but whether the prosecution could prove it to them 'beyond a reasonable doubt'.

In fact, the blame for failure to convict lies not with the jury or the much maligned justice system but with the prosecution and particularly the LAPD which was proven once again to be not only incompetent and high-handed but full of racist Rambo type police officers who seem to think they are above the law. The LAPD is particularly cavalier about observing fourth amendment rights which are supposed to protect citizens against unlawful search and seizure. If the police do not observe the law when collecting evidence, conducting searches, making arrests and so on, their evidence can be thrown out of court or seriously compromised. In this case the police acted in their usual manner, searching Simpson's house illegally the morning after the murders (and later lying about why they went there) in the process of which they came up with the only physical evidence linking him with the murders (the blood on the Bronco, the bloody glove) which on top of it was collected in a sloppy manner. Moreover one of the detectives who carried out the search (Mark Fuhrman) was later shown to be a perjurer and a virulent racist who the defence argued was entirely capable of planting evidence to incriminate a black man. In the beginning the defence's strategy seemed like a desperate and far-fetched ploy to deflect attention away from the apparently overwhelming evidence against Simpson, but eventually it became its trump card as the picture it was able to build up of Fuhrman's character threw doubt on his testimony. Thus it was a major mistake on the part of the prosecution to construct so much of its case around Fuhrman and the evidence he helped to collect. As evidence of the LAPD's incompetence and the racism of some of its officers was accumulated by the defence team increasingly it was the police and in particular Mark Fuhrman who were on trial. In a sense, then, the celebration by blacks was not for O J's acquittal but for the indictment of the system – just as blacks rioted in LA when the system failed to deliver justice in the Rodney King case.

More than the Fuhrman issue, the jury's decision seems to have been influenced by the fact that the prosecution had no direct evidence linking Simpson to the crime (no murder weapon, no eyewitness). Winning a murder conviction based only on circumstantial evidence is in any case difficult, it is made even more so when the defendant can afford the best defence attorneys. The jury seems to have ignored the complicated technical evidence based on blood samples (DNA etc.) introduced by the prosecution, and used their common sense to zero in on the obvious weaknesses of the case – Fuhrman's lack of credibility, the glove supposedly worn by the murderer that did not fit Simpson, the fact that there should have been much more blood on his car than was found, the time factor (whether O J had enough time to commit two murders, reach home, get cleaned up, leaving little evidence behind, and catch his plane). Based on these

considerations they did not have much trouble agreeing that the prosecution had not proved its case beyond a reasonable doubt. The jury's matter of fact appraisal of the case stands in sharp contrast to the media's construction of what would happen which focused on the race factor and the jury's presumed sympathy for OJ. As several legal experts have pointed out, it is mistaken to suppose that black juries will not convict in criminal cases involving blacks: in fact the opposite is true: for blacks suffer disproportionately from crime and tend to be very harsh judges. The deciding factor in this case was not race but the prosecution's weak case together with a strong defence strategy. Since the verdict then was quite reasonable, why the huge public outcry about miscarriage of justice and the incompetence of the jury? Did the public expect the jury to behave like a lynch mob and convict on the basis of their gut feelings, as a white jury might have done?

For all the hand wringing (this time mostly by whites) about how the justice system failed to deliver justice, the OJ case says very little about how the system really works. Unlike this case, most violent crimes never go to trial: most defendants have to make do with public defenders instead of high priced lawyers, so that the prosecutors do not have to spend so much time and money constructing their cases, and most cases end up in plea-bargains in which the accused plead guilty to lesser crimes and are sentenced accordingly. This is the system through which most blacks are processed and land in jail, guilty or otherwise. It is a system that can be made to work for the rich, which whites have at last discovered but blacks have known all along, and it is also a system with a built in bias against blacks. For example, according to a recent study by the US sentencing commission, drug sentencing guidelines are heavily weighted against inner city blacks: possession of five grams of crack (a cheap form of cocaine popular in the inner cities) carries a mandatory five year sentence while an equal amount of powder cocaine (the drug of choice for affluent whites) is a misdemeanour punishable by less than a year in jail. The report also showed that 90 per cent of those convicted of possessing or selling crack cocaine in 1993 were black, although according to another survey, half of users of the same drug are white. Moreover, about one third of black men in their twenties are in prison, on probation or on parole. Such facts are taken by some as evidence of black criminality and hence a justification for white fear of, and hence discrimination against, blacks, yet they give substance to blacks' sense that the criminal justice system is designed to persecute them.

Although it is clear that blacks are often victimised by the law enforcement and justice systems, OJ is not like most blacks – he is rich and famous and a perfect example of a black man who has made it in white society. In fact he has much more in common with all those rich white guys who have

managed to buy themselves out of trouble with the law (Claus von Bulow, William Kennedy Smith – and by the way, where was the public outcry when these two high profile society guys were acquitted by all white juries?) than with most blacks who land in court. So why this rallying around a man who has been anything but a symbol of black pride (for his preference for white society and country clubs, he was known as an 'Orco')? And why did this turn into an issue of race rather than of class (not to mention gender – the wife abuse issue seems to have been all but lost)? In part it may be due to the way the defence constructed its case, but it probably has more to do with the way in which the media projected it – this is the second level at which it should be understood.

As the trial (and the media circus) proceeded, a complex set of issues were boiled down to one simple one: race and the question of whether a minority dominated jury would convict. This was possible because although television creates a public discourse on issues such as race and sex discrimination, it is also able to control the terms of discourse. In the age of the media, it is becoming harder and harder to separate image from reality: the hype from the real political issues. This has all been said before, especially around election time, but during the last several years the increasing intrusion of the television camera into the courtroom (Bobbit, Menendez, Tonya Harding) and legislative hearings (Anita Hill) has resulted not only in bringing social and political issues into the public forum and opening them to debate as never before, but also in giving free rein to the media to determine the parameters within which such debate takes place. Viewers do not just see a trial or a hearing in progress – they are subjected to continuous running commentary by the anchors and various invited experts, in the process of which several permissible shades of public opinion are given shape. Since the facts of a case are not only gathered, sifted, organised and presented by the media, but in a very real way are constructed by them (through the dramatisation of news, the use of opinion polls, the choices made of what and what not to print or televise, the presentation of people's views, the manipulation of emotion, and so on), it is hardly possible any more to move outside of the dominant discourse on any particular issue and take a fresh look, grounded in reality, at what is happening (if indeed there is anything happening beyond the discourse created by the media). Added to this we have the ratings wars, the compulsion to make news more and more sensational in order to sell one's programme or paper, and it should not surprise anyone that the line between fiction and reality is becoming too thin to see. Far from reflecting or reporting on political issues or people's current concerns, the media has shown itself capable of whipping up a frenzy on one issue or the other – a very good example is the present

concern about 'crime', hysteria about which provides useful public support for building more jails and putting more people behind bars.

This is precisely why jurors in cases such as this are prevented from reading newspapers or watching television and sequestered if necessary lest their impartiality be affected by what they read or hear in the media. Before the trial had even begun, OJ Simpson had been tried and convicted by the media, so the main criterion for selection of jurors laid down by the judge was that they should not have read any newspapers during the selection period. In this connection, two interesting facts came out about the jury – that none of them read newspapers regularly and that most get their news from tabloid television shows – are not only indicative of the calibre of most juries and their ability to assess highly technical evidence (which some commentators have bemoaned) but probably give a fair profile of your average American's reading and viewing habits (leaving aside intellectuals and the upper middle class). It is in this context that one should interpret the various musings about public opinion and what blacks or whites think about this or that issue, for when opinions are formed on the basis of what one reads in newspapers like the *National Enquirer* or sees on TV's *Hard Copy*, and the public is not able to discriminate on the basis of what the media presents between what is true and what is not, it is questionable whether any real public debate can take place at all.

At the same time, the wide public involvement that is generated by the media in spectacles such as this does have the effect of crystallising lines of division – most commonly gender and race – as never before. For example, during the hearings for the confirmation of Clarence Thomas as supreme court justice, during which he was accused by former co-worker Anita Hill of sexual harassment, men and women came down almost 100 per cent on opposing sides – most women believed Hill's story and condemned Thomas, while most men dismissed her as a flake or found the whole affair silly, even if true. Just as the OJ Simpson case was boiled down to the race issue and people were divided along racial lines, the media managed to pare the Anita Hill case down to a gender issue (it could as well have been a race issue too, except that luckily Anita Hill and her tormentor were both black). The similarity in the way in which these two spectacles were mounted by the media almost suggests that the issues are deliberately oversimplified, public opinion manipulated and the debate defined along major social axes in order to generate more public involvement and hence larger viewerships and readerships. While this view may seem overly simple and cynical, the OJ case suggests that more awareness is needed about the ways in which public discourse is constructed on the air waves and can thereby be utilised for political ends.

UN at 50

S Nanjundan

At 50 the UN is in premature gerontocracy, the decline over the last 20 years due to bureaucratic inefficiency and corruption has been compounded by the post-cold war dominance of and dependence on the sole superpower, the US. In the next two decades most countries are likely to place increasing reliance both for security and development on regional organisations and mechanisms. Therefore unless it is able to restructure as a confederal body linked to regional organisations as programming and operational arms, the UN itself has not much of a future.

I Introduction

THE plenipotentiaries of 51 founder members who met in San Francisco on June 26, 1945 were not aware that in six weeks from the date of signing the US was to explode atomic bombs over Hiroshima and Nagasaki thus ushering in the nuclear era. Secondly they were not aware that very soon the victors would be divided and two worlds would emerge in a cold war which would intensify and last 44 years till 1989. Thirdly while the founders anticipated decolonisation and provided a machinery for facilitating the process, they by no means envisaged the development of a third world – which played a constructive role in the 1960s and 1970s – taking UN membership to 185 by 1995.

When representatives of member countries met in celebration 50 years later on June 26, 1995 at San Francisco they had varied thoughts, emotions and expectations. The secretary general of the UN was worried about the continuing financial crisis due to mounting expenditures on peace-keeping matched by mounting arrears in payment of assessed contributions by members, in particular the US. President Clinton gave importance to reform of UN, IMF, World Bank, WTO etc. while leaving unsaid that they should kowtow to the needs as viewed by the G-7. India and a few other major developing countries might have been dreaming of permanent membership of the Security Council. European countries could have had in mind Bosnia and differences within NATO on the Serbian problem. The NICs of east Asia and Latin America were perhaps bothered about their own regional groups and power equations with the US for Latin America and with the US, China and

Japan for east and south east Asia. Last but not least Australia down under was perhaps scheming to checkmate South Africa, Mauritius and India to dominate the proposed Indian Ocean rim group in addition to being an Asia Pacific power. After all, if the US could belong to both the Atlantic (NAFTA) and the Pacific (APFC) why could Australia not belong to the Pacific and the Indian Ocean? The poor of Africa and south Asia were forgotten having been disposed of at the World Social Summit in Copenhagen in March 1995.

Fifty years after the establishment of the United Nations it has apparently become peripheral and the world is organising into neighbourhood groupings to derive the advantages of mutual trade, scale economies and peace and security. The UN is too centralised and too far removed from the real problems in the field. As for the haves, both co-operation and competition between regional alliances and negotiations (with or without WTO) will they probably feel lead to development and prosperity. For the have nots it is the US and the G-7 powers – via IMF and World Bank rather than the UN – who will provide development and security.

This caricature is not a verdict on the UN's failure but rather an indication of its limitations. In reviewing the future of the UN this limitation arising from over-centralisation, over-bureaucratisation and non-propinquity (to the poor half of the world) should be taken into account. At the same time, the UN's past achievements need to be recognised. First and foremost, the UN provided the forum and the mechanism for decolonisation leading to almost all dependent peoples attaining independence. More recently, problems in Angola, Cambodia, Mozambique, Namibia,

Zimbabwe and South Africa were faced and solved successfully. Secondly the UN provided the stage and often the *modus vivendi* for balance and containment during the cold war, the third world playing an increasing role in the 1960s and 1970s. Thirdly it was under UN auspice that basic studies and programmes of economic development and industrialisation were initiated in the late 1950s, the 1960s and early 1970s.

In the context of the current situation and future requirements the issues of peace and security, sustainable development and rights (human, legal and citizenship) of peoples of the world were studied by the independent Commission on Global Governance from 1992 to 1994. The commission was jointly chaired by Ingvar Carlsson of Sweden and Shri Jagan Ramphal of Guyana and had 26 other members. Its report *Our Global Neighbourhood* was released in March this year.

The commission's proposals and call for action are based on an idealised goal – a vision emanating from (i) emancipation and empowerment of the world – a shift from nation states to peoples and evolution of an international civil society; (ii) interdependence resulting in commitment of international citizens to common responsibility and shared effort; (iii) based on the above two assumptions, reform of the institutions and processes of global governance with a view to renewal of the international system of the Charter. The co-chairmen of the commission rightly observe that the challenge is to strike the balance in such a way that the management of global affairs is responsive to the interests of all people in a sustainable future, that it is guided by basic human values and that it makes global organisation conform to the reality of global diversity.

It is this writer's assessment that assumptions (i) and (ii) above are not valid in the post-cold war era – that enlightened world leadership does not exist at present and there is no will for action to bring about the reform required to meet the challenge posed by the co-chairmen (in the last sentence of the above paragraph). Our approach will be to take the realities of the power and economic balance and try to propose such changes as are possible and desirable for international co-operation. This writer feels that there is no point in strengthening the UN as such but rather those mechanisms and processes of international and regional co-operation

which could pragmatically and cost effectively subserve peace and security sustain development and people's participation. It is not intended to throw away the baby with the bath water. We advocate a smaller UN, a decentralised confederal body linked to and making use of regional organisations for monitoring, preventive action programming and operations relating to peaceful settlement of disputes, enforcement as well as trade and economic co-operation. The specialised and technical agencies of the UN system including those on international law, environment and global commons, NGOs and others participatory of peoples and civil society need to be restructured, trimmed and directly linked to regional organisations.

II Peace and Security

Except during the glorious period of the second secretary general of the UN (Dag Hammarskjöld 1953-61) the UN has always been reactive rather than proactive on security questions. In 1950 the US took the initiative on the Korea question and organised military action under its leadership, though in the name of the UN. In the light of its monopolisation of the Security Council since 1989, it is noteworthy that fearing the Soviet veto in the Security Council the US at that time took a sort of preventive action by having the Korean action approved by the UN General Assembly under the 'Uniting for Peace' resolution. Apart from being active in the Congo and Jerusalem under Hammarskjöld the Security Council did little during the cold war period until about 10 years ago. The two superpowers were negotiating and containing each other's blocs. The UN could do little or the big powers did not want the UN to do much in West Asia or Indochina or Cuba or Berlin or Hungary or Czechoslovakia. Even on decolonisation, while the third world bloc in the UN kept up the pressure it could act only if the imperial power (e.g. UK or France) or the US wanted the UN to act.

There has been a dramatic change in the role of the Security Council and its use as a *modus operandi* in the last 10 years and particularly since the end of the cold war. The US dominates the scene encountering virtually no opposition, issues, decisions and draft resolutions are discussed informally among the five permanent members or even three of them (minus Russia and China) and steamrolled at formal meetings of the council. The conduct of the Gulf war against Iraq in 1991 and continued

stalemate over formal ending of the war represents a mockery of the procedures and ideals of peaceful settlement of disputes under Chapters VI and VII of the Charter. That action favouring an ally of the US takes precedence over empirical judgment on issues has been reflected in the US veto (May 1995) of a resolution against Israeli requisitioning of land in East Jerusalem and in July the condoning and justification of Turkish invasion of Kurdish areas in north Iraq (while losing no opportunity to condemn Iraq's more democratic approach to Kurdish autonomy). The US turning a Nelson's eye to the nuclear and missile programme of its ally Pakistan while objecting to a similar programme in Iran is another instance of unprincipled hypocrisy.

With the end of the cold war there has been a sea change in perceptions about the UN, attitudes of key players, their governments and people and even their world view. While technology (price, computer, chip, internet, E-mail, etc.) together with liberalisation, marketisation and democracy have perhaps promoted the global village concept, regional groups for economic co-operation and security have taken the place of old security and military alliances. Despite the domination of the US there is an undercurrent of power rivalry. The obsolescence of human resource development in the US and its other domestic problems perhaps makes it adopt a defensive and isolationist posture not trusting anyone except close buddies of G 7, often minus Japan. It is natural for the US to regard the Security Council as a handmaiden, as a staging post, at best a catalyst, and not an agent and certainly not as a means for ensuring absolute collective security envisaged by the Charter. The despatch of US troops to Somalia in 1992-93 was not acceptable to Congress and the US people. And US intervention in Bosnia is similarly questioned.

Three broad issues will be reviewed here under the gamut of peace and security: (1) the UN Security Council, (2) military action by the UN and (3) non-proliferation and disarmament.

The founding fathers of the UN in their wisdom gave absolute and permanent power over peaceful settlement of disputes to the five victorious allied powers: the US, the Soviet Union, the UK, France and China. They are five permanent members of the Security Council in perpetuity, each enjoying a veto on decisions. This is the biggest impediment to reform of the UN. None is willing to be out and opportunities have been missed during the long stalemate over Chinese representation, during the cold war when veto was a constant threat and

at the time of the demise of the Soviet Union in 1989, Russia quietly taking the place of USSR without a finger being raised. Now everyone including the permanent members themselves realise the absurdity, unrepresentativeness, unfairness and inequity of the situation. Yet none of the biggies is fair enough or enlightened enough to find a solution – an indication that the UN does not matter: it is peripheral; the permanent five will decide or the G 7 will rule the world. The US agreement to take in Germany and Japan as permanent members (perhaps without veto) is a recognition of the paying power of these countries. It does not make the council any more democratic. More power to the already powerful, the poor remaining as voiceless as ever!

This writer feels that this crucial question demands a *de novo* approach taking into account the growing phenomenon of regional co-operation. Permanent country membership and veto should be abolished and the council composed of 20 or so representatives of regional organisations covering the entire membership of the UN. This should go with a confederal restructuring of the UN itself, the designated regional organisations being responsible for the settlement of regional problems and also being regional UN arms. The UN itself will then be a small compact co-ordinating body dealing with interregional and worldwide issues. Specialised agencies will work independently as at present but not overlap with regional organisations.

Since some countries are members of more than one regional organisation while a few are left out of any organisation, the representation will have to be worked out carefully and provision made for changes with evolution of new ones. There could be one representative each from NAFTA, EU, CIS, east Europe (including Malta, Cyprus, Israel), central Asia (including Turkey and Iran), Arab League (North Africa), Arab Gulf, SAARC, ASEAN, Far East (China, Japan, Korea, Mongolia), South Pacific forum (including Australia and New Zealand) and North Pacific, Caribbean, central America, south America, west Africa, central Africa, east Africa and southern Africa. The secretary general of the UN should be the chairman of this new Security Council which may meet regularly once a month to take policy decisions, give advice/directions to regional organisations and monitor the world security situation. Decisions may be by a two-thirds majority.

As regards military action by the UN for peace-keeping and peace-enforcement, the disastrous Bosnian experience (and the UN's abject failure) has reopened several questions. The concept of a unified command has

virtually been given the go by, troop supplying countries wishing to control policy and operations. The induction of NATO's Rapid Reaction Force has virtually taken military operations out of UN hands. But on the political question NATO itself is divided: the US wanting to make a gesture to Turkey and the Islamic world by allowing arms to be supplied to Bosnia while being apprehensive of Slavic Serbia with its Russian backing. One is not quite sure whether the Europeans back the pre 1918 Ottomans or the Czarists. The Germans and Austrians certainly support Croatia and Slovenia and would not like a resurgence of Slavic power. At any rate the western powers seem to agree on limiting the UN's role to that of a catalyst keeping it out of peace enforcement. They would like operations like the Gulf war using the UN only as an address. NATO can do the job and the US has its central and Pacific commands too. Another example is military action in Liberia undertaken by Economic Community of West African States (ECOWAS) and not by the UN directly. As things look right now operations by the UN directly under Chapters VI and VII of the Charter are likely to decline. The US pays 30 per cent of the cost of peace keeping. Congress is most unwilling to spend money unless there is a direct US interest e.g. oil in the Gulf. Germany and Japan too are most reluctant to support or undertake military operations (outside Europe in the case of Germany). There seems no alternative except to involve regional organisations directly in their own affairs.

Preventive security measures through disarmament face a problem of deception. The big powers are also sellers of arms and whatever the international policy they do not hesitate about the transfer of even nuclear and missile armaments to close allies if this is in their own interest. The permanent treaty on nuclear non-proliferation is a mockery without a comprehensive test ban treaty (CTBT) and with China and France resuming tests within days and weeks. The same is true of the missile technology control regime (MTCR) since missiles continue to be supplied to Israel, Pakistan, Iran, etc.

A commentary on the current security perception in East Asia for instance is the reported reluctance of any ASEAN country to criticise China for the recent incident in the Spratly group of islands 'showing the flag' to the Philippines in a disputed claim. This was at an ASEAN-APEC summit where continued US defence umbrella over the region was reportedly felt necessary (perhaps even by China and Japan). No further evidence is needed that the UN is regarded

as peripheral on security questions, a post box or an address.

III Development Co-operation

In the early years of the United Nations the IMF and World Bank were preoccupied with reconstruction and stabilisation in war ravaged Europe. In the late 1940s and 1950s the UN took the initiative in studies and programmes of development and industrialisation. UN technical co-operation projects developed during the 1960s. From the mid 1970s however the World Bank has stolen the march with structural adjustment programmes intensifying in the 1980s and 1990s. The resources, capacity, professionalism and longer term outlook of the Bretton Woods institutions as well as the specialised agencies in education, health, agriculture, trade, industry, labour, etc. are much more than those of the UN and its UN Development Programme which in the present context seems to be duplicating and overlapping with the more capable agencies. Much could be gained by closing down gradually UN/UNDP's direct activities in development and letting the World Bank, the agencies and funds and programmes (population, children, environment, refugees) function independently and directly with regional bodies and countries.

The setting up of an Economic Security Council in place of the current Economic and Social Council has been proposed by the Commission on Global Governance to monitor the world economic situation from time to time to propose corrective and timely action and co-ordinate the policies and actions of different agencies. This writer feels that co-ordination and co-operation should first be achieved at the regional organisation level with specialised agencies. Secondly, the reconstituted Security Council as proposed earlier could itself carry out this task with a second tier of representatives of agencies preparing the groundwork and assisting the Council. Another way of forming the Economic Security Council may be to hold joint meetings of the developed G-7 (G-8 including Russia) and the G-15 of the developing countries (formed by the non-aligned movement).

The commission has proposed the abolition of UNCTAD and UNIDO, the two organisations which gained notoriety in the 1970s, as advocates of the developing countries through domination by G-77 (the grouping of the developing country members of the UN). It is unfortunate that the proposal is not based on an evaluation of the work of these agencies but on the

argument that that work is no longer needed. Of course they are no longer needed by the developed countries and this writer believes they cannot do much in the current environment. It is not without significance that technical organisations not impinging on macro and international policies have been spared by the commission leaving the IMF, World Bank and WTO to rule the roost.

This writer is strongly in favour of a leaner and starker UN organisation and agrees that the regional economic commissions may be overlapping with the recently established regional trading/economic/political blocs. Duplication, overlapping and rivalry amongst the UN specialised agencies need to be removed and close co-operation take their place, especially by their becoming resource agents of the new regional organisations.

The history of growth and development has shown that endogenous factors of human resource development, savings and investment, entrepreneurship, management, leadership, work ethics, culture of working together, the right mind set and character are far more important than exogenous investment, technology flows and technical co-operation. And the UN as an exogenous factor of development plays only an infinitesimal part in the whole process. Playing the game to national advantage in the global village needs close interaction and co-operation of government, business, labour, industry, education, health, science, technology, sociology and psychology, with a clear perception of the objective of development: growth, income, employment, equity, poverty eradication, rural development, etc. A country or a region or a group has to choose the priorities and work together for attaining the objectives which can be influenced but not determined by exogenous factors. No crocodile tears need be shed therefore over trimming the UN's development role. As for the poor countries, apart from endogenous development their regional organisations shall be directly helped by a competent agency or agencies of their choice including by means of co-operation with other developing countries (ECOC/TCDC), rather than by a centralised UN/UNDP mechanism, expansive, inefficient and tardy in delivery.

Genuine willingness to co-operate and work towards reducing the asymmetry in the distribution of incomes and productive power is not evident in the attitudes and behaviour of developed or donor countries. It has truly been said that while globalisation and liberalisation has promoted interdependence among developed countries themselves, the

dependency syndrome of poorer countries might have increased. For instance, a *quid pro quo* is demanded only from developing countries for implementing international agreements on movement of professionals, on freeing textile imports, on ozone depletion etc. Accommodation and a willingness to co-operate is often more important than aid itself.

IV

Conclusions

The existence of the United Nations system with its delicate balance amongst the first, second and third worlds may well be credited with having prevented a third world war from taking place in the last 50 years even though most of the crucial negotiations took place outside the UN among the superpowers and others. The UN can also be credited for successfully handling the job of decolonisation and the resulting four fold increase in UN membership. The UN and particularly the specialised agencies have contributed substantially to economic, social and human development despite overlapping, wastage and often cost ineffectiveness.

A deterioration in the role and significance of the UN has come about since the oil shock of the late 1970s. While the first world's fears of the third world ganging up against it proved premature and unwarranted, partly due to lack of will of the oil powers to press their advantage, the waning interest of the developed countries in the UN accelerated, resulting in the UN being unable to raise sufficient resources. Bureaucratic inefficiency compounded the problem.

A resuscitation of the UN's role began about 10 years ago with the deceleration of the cold war and more accommodation among the superpowers. The UN's role and activities in peace keeping increased. However, with the dismemberment of the Soviet Union in 1989 US domination of the new world order has reduced the UN to a tool of the US, since other powers toe the line of the US. Added to this is the growing role of regional groups like the European Union or the ASEAN. Members of the UN tend to work as a regional group. It should be noted that the US contributes 25 per cent of the overall costs and 30 per cent of peace keeping costs of the UN and has borne the brunt of responsibility (and power) in recent years.

The dominance of the coterie of five permanent perpetual members of the Security Council representing only US, Europe and China makes a mockery of the universality and democracy principles. Yet little can be

done to remedy matters since they are unwilling to give up the monopoly of power. On the economic and social front, greater interaction of governments, business, finance, labour and services globally in the context of new technology and liberalisation has made the UN's role somewhat redundant, though it may give a greater role of specialised agencies such as IMF, World Bank, WTO etc. and to regional blocs like EU, APEC, NAFTA, etc.

The United Nations is at the crossroads. It cannot survive for long as a centralised bureaucracy, a monolith detached from the evolving dynamic regional organisations acting as an appendage of the US on security matters. It can rebuild itself as a leaner, starker outfit, linked to the regional organisations to whom functions of monitoring, surveying, programming and operations in the respective regions could be delegated. Similarly, the specialised agencies should review and prioritise their activities, eliminate overlap and duplication and work directly with regional organisations. We propose that the Security Council be composed of representatives of regional organisations, a total of 20 members presided over by the Secretary General. There will be no veto. Intra-

regional disputes will be handled by the respective regional bodies. On monitoring the world economy, this could either be done by formal meetings of the rich G-7 jointly with the G-15 of NAM, or by the Security Council itself as reconstituted. In any case a second tier inter-agency group of specialised agencies will do the groundwork and assist the so-called Economic Security Council.

Finally, to bring about effective changes, the secretary general of the UN to be appointed next year should be carefully chosen for dynamism and carrying conviction all round. The person should be sincere, sympathetic and have a proven track record. This writer would commend ex-US president Jimmy Carter for the job. His work as US president to achieve the Camp David settlement between Egypt and Israel, his negotiation of hostage release from Iran and the success of his domestic macro-economic policies have not been properly recognised. He has done even better under the Carter Centre in Guyana (1992), North Korea (1992) and Haiti (1993). Above all, his appointment will be a recognition of the past US contribution to the UN and perhaps a means of its continued involvement in a UN not necessarily dominated by it.

NEW AGE INTERNATIONAL PUBLISHERS

NEW

POVERTY MEASUREMENT ISSUES, APPROACHES & INDICES

P.K. Chaubey

This timely publication deals with the measurement of poverty. The author has intended this to be a volume on theoretical and empirical issues related to indices of poverty.

The book will be immensely useful to all concerned with the question of poverty, particularly those interested in its measurement aspects.

Unfreezing Mira

Gabriele Dietrich

Upholding the Common Life: The Community of Mirabai by Parita Mukta.
Oxford University Press, 1994

THIS book by Parita Mukta is extraordinary in methodology and content, though the style remains within the confines of scholarly anthropological study. Parita Mukta, brought up with Mira 'bhajans' herself, had set out during the 1980s to place Mira's memory in the socio-historical context of Rajasthan and Gujarat. What she had found at the outset was that Mira had not been sung in Rajasthan until recently, that her memory had been ostracised and suppressed as her life had been an open challenge to the Rajput ethos, that her name was used as a term of abuse levelling charges of promiscuity. This is in stark contrast with the image of Mira as a satyagrahi which Gandhi used in the freedom struggle. It also does not explain why a Mira mandir should have been built in Chittorgarh by the Sisodia ruler in the recent past. The suggestion that the Gujarat middle classes have promoted Mira 'bhakti' also does not explain how Mira's memory might have survived before this middle class came into being. The field work therefore focused on the Mewar region itself, the main site of social conflict provoked by Mira's life, then shifting to Marwar her environment of birth and Saurashtra where she migrated and where her life ended under unexplained circumstances.

The important features in Mira's life which stick out in the oral traditions as in the written biographies are her rejection of marriage and of the 'kul', the tradition that she survived attempts to murder her at the court of Mewar, and her migrant life among the 'bhaktars' until her disappearance in Dwarka. Parita Mukta traces the responses of different communities to the life of Mira and thus places Mira herself and the ways how her memory has been upheld within the caste-class constellations of the life-world which has responded to her life and preserved her memory. What emerges is a significant contrast between the 'people's Meera' rooted among weavers, agriculturalists and chamars, the mercantile

middle class version and the feudal Rajput ethos.

The strength of this book is not only the meticulous field research but also the capacity to make social context visible in written and oral sources as well as in other media like film or political campaigning during the freedom struggle. Parita Mukta shows how the history writing which emerged after initial hagiographies was rooted in the ethos of the merchant communities. She also shows that Meera's bhajans were not incorporated in the early collections of the Vaishnav sects and that historical records have not taken notice of her in her own time. She shows how positivistic 'scientific' history writing of the 19th century has individualised Meera's experience and how she has been consistently co-opted into a high class philosophical Hindu ethos which has completely obliterated people's protest tradition. She identifies this as the underlying matrix which has led feminist writers like Kumkum Sangari to criticise Meera for her obsessive religiosity while missing out completely on the powerful protest content of the oral traditions which were rendered invisible. Parita Mukta rescues Meera from the sphere of domesticity, feminised creativity and sentimentality of homebound women. She tries to trace the specific socio-historical conditions in which Meera could rise as a popular figure, could gain support for her life against the Rajput mainstream and could be sustained in her life as well as in her memory afterwards, beyond the individual subjectivity of her own personal faith and convictions. Parita Mukta thus unfreezes Mira from her textual biography and from the oppressive association with the Krishna bhakti of destitute widows living on charity and places her within the community of peasants and artisans whose relations and feelings have kept her memory alive. She shows that without this community her memory would have been obliterated and even the later middle class recuperation would have had no material to draw on.

Community in Parita Mukta's understanding, in which she partly draws on Raymond Williams, has three connotations: (1) The immediate 'bhajniks' (2) Those people – though not necessarily active adherents of bhakti – whose experiences are articulated by these bhajans, who have experienced feudal oppression, unwanted marriages, widowhood, untouchability,

penury. And (3) the reality of a common life as it emerges around caste and class affiliation around Mira bhakti's community which nurtures and strengthens the oppressed through the power of religious expression (p. 40). The most vociferous protest dimensions can be found in Marwar and Mewar where Mira the rebel gives strength to anti-feudal ethos. In Saurashtra Mira the mendicant comes to the fore strengthening a community of exiles who face deprivation. Parita Mukta places such Mira bhakti close to the slave religiosity in the South of the US. Far from being a diffused and confused protest, she tries to show the coherence and force of the 'morality of the people' (Gramsci) as distinct from official morality. In Parita's words: 'One must enter the vale of tears to grasp the conditions of the people's morality. Mira enables us to enter this vale' (p. 45).

The second chapter works out the historical power struggle between the Rathors of Mewar and the Sisodiyas of Mewar and makes visible the martial ethos of 'kul' (clan) and bhayad (brotherhood) connected with control over land. Marriage within this ethos involves a history of war, hatred and revenge, as the lineage of inferior power had to give their women to the stranger political power. By bhakti Mira asserted the power of love. She undermined simultaneously the power of the patriarchal husband, the prince and the superior clan which was wielding state power. In the succeeding chapters Parita Mukta works out the ostracism of Mira among the Rajputs and the affirmation of Mira bhakti among the dalit communities like weavers, leather workers and sweepers. Her connection with the leather workers goes through the tradition of Rohidas who was a chamar himself as Mira's guru. Mirabhakti is located within the rising artisanal classes and later spreads into the peasant communities. It was in the 16th century that these communities emerged and Mira bhakti took roots. The peasant communities took to Mira because of her resistance to the Rana of Chittor – as it was their taxes which contributed to the ostentatious life of the court while the hierarchical system denied them dignity. Parita Mukta emphasises the importance of men identifying themselves in 'strivachya' the female voice and works out the ethos of the "underprivileged who are tied to each other by a distinct set of values that affirm a simple life uncorrupted by wealth and privilege" (p. 91). 'Vairag' (renunciation) for Meera did not mean death to society but a life renouncing privilege and living closely with the people. The bhajans witness to this collective identification. 'These bhajans are not only sung by ascetics, renouncers, who bear only a tangential relationship to social life but by people to whom poverty is a

* This makes the book at times somewhat difficult reading especially since quite a bit of the background history of Rajasthan and Gujarat is taken for granted. Explanations of cultural metaphors and background history for the less familiar reader would certainly be of help. However, if one takes the trouble to get one's teeth into this dense material the attempt will be eminently rewarding.

condition of everyday living" (p 95) The community of bhajniks which uphold this allegiance to Mira cuts across caste and is held together by poverty and evocation of a common life. This is most strongly symbolised by the protest against purity and pollution in accepting Rohindas a chamar as a guru. Parita Mukta gives contemporary instances of how a group of dalits travelling ticketless to celebrate Ambedkar's birthday in Bombay broke into Mirabhajan to defend their right against middle class passengers (pp 109-11).

The fourth chapter works out in great detail Mira's protest against the institution of marriage and makes clear that she did not just replace it with a marriage to Krishna but with the assertion of a life of her own. This also implies the rejection of widowhood. Both these aspects Gandhi in his version of Mira could not acknowledge. Resistance against such free choices came up not only in the attempt to murder Mira but also in the repression of the community as chapter five shows.

The bhajans from Saurashtra analysed in chapter six make visible the commonality between the community of beggars, mendicants and itinerant singers and the poor low caste communities who sustain them. Here Mira's personal emotionality and choices are more emphasised.

Parita Mukta sees this process of recreation of Mira's experience as a process of the recreation of the communities which sing her bhajans. They have encapsulated a vision of Mira through whom they project their own history as well as showing the centrality of Mira in cementing alternative bonds. There is a collective political and deeply personal bonding here (p 165).

The third part of the book analyses the co-optation of Mira by the middle classes, be it in the sanctified Gandhian version during the freedom struggle, be it modern film and cartoon versions. In the freedom struggle her quality as a satyagrahi is balanced out by depicting her as a pious, devoted wife completely neutralising her protest against patriarchy, family and feudalism. Not only this, Parita Mukta shows how the people's Mira was rooted in a process of shared struggle and suffering while Gandhi's Mira imposed ideals of distracted love of humanity which ultimately betrayed and antagonised people's struggles and contributed to the defeat of mass movement (p 197).

Such sanitised versions were amplified by the medium of film and the critical edge of Mira's affirmation among the low caste/low class bhajniks was systematically blunted. Such use of mass media is in danger of obliterating the popular culture in course of time. Not only this, the depictions of Mira have become more and more base. This cuts into the community of Mira who has persevered in upholding her memory. The

final chapter shows how such film versions shape the Krishna bhakti of middle class housewives and widows and how their emotional rejection of unequalitarian and unfulfilling relationships is channelised into safe isolation. The significant fact is that the bhajniks throughout have upheld the rebellious and controversial life of Mira while not a single bhajan mentions her death. Legend says that she merged with the murti at the Dwarka temple which only leaves open the two possibilities of destruction by the rana's emissaries and self-destruction. The bhajans only affirm the failure of all attempts to destroy Mira. Self-destruction would cancel out the hope within herself and the community of bhajniks. At the end of her book Parita Mukta identifies an open door which may have enabled Mira to live on among the bhajniks.

This book not only makes invisible history visible, it also shows how different castes and classes appropriate and reshape their own history and culture within their life world. It is a powerful testimony against the elitist versions of cultural and religious heritage. At the same time it raises very crucial questions on what happens to

culture and life world in the present context. The book has been published as we reach a point where we increasingly feel the economic and cultural impacts of globalisation, while the research has been done in a period when such onslaught could not yet be felt to its full extent. The question of cultural resistance takes on new importance in this situation. Not only that, the main thrust of Mira bhakti itself – the renunciation of privilege for the sake of affirmation of the common life – is of utmost relevance. The bhajniks of Rajasthan and Gujarat today find themselves engulfed by the political culture of Hindutva which could doubtlessly co-opt Mira as it co-opts Gandhi and Ambedkar. In such conditions studies as this are of a life saving quality as far as people's collective memory of solidarity goes. It is imperative that popular movements which try to protect people's right to life and livelihood take note of such research and give it back to the people who have made it possible in the first place. It may be extremely difficult to defend such alternative identities in the present situation but obviously the attempt itself is of utmost importance.

APPOINTMENTS

SHRAMIK VIDYAPEETH, PUNE.

INDIAN INSTITUTE OF EDUCATION
128/2, J P Naik Path,
Off Karve Road, Kothrud,
PUNE 411029

(Sponsored by Government of India)

Applications are invited for the post of Director, **Shramik Vidyapeeth, Pune**, a centre of the Institute, in the pay scale of Rs 3000-100-3500-125-4500. Candidates intending to apply for the above post may obtain the prescribed application form and details of qualifications etc. by sending a self addressed envelope of 9" x 4" size bearing postal stamps along with a requisition on plain paper stating name, address, age, sex, qualifications and experience, within 15 days from the date of publishing advertisement, from the registrar of the institute.

DIRECTOR

The Real Situation in Kashmir

A G Noorani

Heat and 'Mast' in the Valley, Committee for Initiative on Kashmir, B-10 Green Park, New Delhi 110016, 1995, Rs 20

SINCE the outbreak of militancy in Kashmir six years ago the Committee for Initiative on Kashmir has established a formidable reputation for its reports on the situation there. Readers of this journal are familiar with the excellent analyses by one of the leading members of the committee Gautam Navlakha. This is not a report only on the destruction of the shrine at Char-e-Sharif on May 20 1995 though a long part of it is devoted to an on the spot report following the visit to the place by a team from the committee consisting of Ashok Aggarwal, Tapen Bose, Dinesh Mohan and Gautam Navlakha. They were in Kashmir from June 25 to 30 and the report contains a careful resume of events preceding the destruction of the shrine based on first-hand reports and an incisive analysis of the various versions. The questions they pose brook no evasion.

But they do not stop there. They proceed to discuss the role of guest fighters in the valley and the basic change they have brought about in the situation: the behaviour of the security forces and the outlook of the people today. The report shows empathy for those who really matter: the people of Kashmir without in any way compromising its objectivity. The report reveals a mastery of the printed record in press reportage. Personal observation fills the gaps.

It is clear by now that both the United Headquarters in the state and the union ministry were marginalised. The army was given a free hand. Who else could have done that but the prime minister?

The report contains by far the most detailed resume of the events before the destruction of the shrine to yet appear. There is no dogmatism in assertion but the balance of probabilities is indicated clearly enough.

There is also an eyewitness account of *The Statesman* correspondent (20/3) about shelling at Char-e-Sharif when he went there to interview Mast Gul. Could all these accusations against the army be motivated? The account of the townspeople about helicopters strewing gunpowder and firing parachute borne flares has been discounted by many as exaggeration and technically incorrect. However, it should be noted that the account of the townspeople has remained the same since the first batch of journalists reached Char-e-Sharif on May 12. The parliamentary delegation and team from the Editors' Guild met them in-between and exactly a month and a half later when we interviewed them they said the same thing.

It must be remembered that in the middle of an inferno the account of the townspeople who are not military experts cannot be dismissed simply because they are unable to identify weapons accurately. It is their description that carries weight. The people we spoke to talked about gun-firing and every now and then light flashing through the night and of buildings catching fire where the light landed with a sound of explosion. We were also shown a few empty 51 mm mortar shells and parachutes for 51 mm mortars with Indian ordnance factory markings said to have been recovered from the rubble of the burnt down houses.

The town was engulfed before the shrine was destroyed. Why did the army advance towards the shrine after the basti was destroyed? What compelling reason motivated such a move? The curbs on the press from March 17 are well known. As the report points out neither the Editors' Guild nor the Press Council was exercised about it.

The 'face of relief' and 'compensations' is described in meticulous detail. The discrepancies in the number of the 'guest militants' in the town given by the authorities are listed carefully. As for the much vaunted policy of 'transparency', all we have had are guided tours. In May 1994 the Iranian ambassador Sheikh Attar ripped off the pretences that cloaked the visits of diplomats to Srinagar.

The report's comment on transparency is telling. 'The interesting thing is that no one demands transparency where people are concerned where their lives and welfare are threatened. Transparency does not mean allowing select group of diplomats and other dignitaries access to the 'disturbed' area so that they can return home to file political reports. By disarming the word transparency of its democratic connotation, transparency has become an euphemism in officialese for image-repairing exercise. Transparency in its actual sense means access of people to correct information and authority, as well as accountability of the authorities to the people. This provides protection of people from the arbitrary and inhuman conduct of the servants of the government. In fact, if transparency had been intended, a non-militaristic approach to address the issue of people's alienation in Kashmir would have been accorded top priority, and chances of destruction of Char-e-Sharif would have been minimal. In the absence of transparency, repression continues unabated. Incidence of arson and pillaging had been a common feature in the six years

of insurgency, and Char-e-Sharif appears to be the latest act."

In the wake of the tragedy "there is a further clamping down rather than easing of repression." Both the governor general K V Krishna Rao, whom nobody respects and the union home minister S B Chavan talk of a return to normalcy conveniently seizing on some features of the situation today and ignoring the rest. This reviewer noticed during a visit to Srinagar last April that there was a genuine yearning for the resumption of tourist traffic which however did not indicate the slightest lessening in alienation from New Delhi.

The report captures the people's mood accurately in all its nuances and deserves to be read by the two election commissioners (T N Seshan the CFC is not only uneducated but also uneducatable). The report records.

On the surface the hustle bustle of daily existence has replaced the cry for Azadi. School children working people old, adult and young men and women are moving about. Marriages, deaths, births continue. Agriculture and farming of commercial crops have grown at the rate of 4 per cent. Foodgrain production has increased from 11.42 lakh tonnes in 1989-90 to 14.61 lakh tonnes in 1993-94 (70/1 June 12). Foreign exchange earnings from walnut exports rose from Rs 15.27 crore in 1989-90 to over Rs 60 crore in 1994-95. Handicraft exports increased from Rs 59.72 crore in 1989-90 to Rs 250 crore in 1994-95. Fruits exported to India in volume increased from 5.18 lakh tonnes to 7.63 lakh tonnes between 1989-90 and 1993-94. And it amazes one to see the large number of buildings being repaired or constructed. If life is so uncertain why should people invest in buildings. Unless this is a sign of fatigue. Or a loss of faith in the movement. All officials are convinced that the people's desire for peace overrides every other consideration. And yet beneath this surface what is palpable is an element of getting used to militancy: a realisation that it is going to be a long haul.

There is also disgust and revulsion at the misdeeds of militants. But neither that nor the despair imply disavowal of their political aspirations, which are proclaimed by one and all in the valley without exception: the right to self-determination. The alienation from the union is total and deep.

The government of India studiously sought to undermine the Hurriyat as it did the IKLF to the gain of the pro Pak Hizbul Mujahideen. The Hurriyat leaders have, thanks to no small extent to their own disunity and lapses, lost considerable ground. The local militants have lost ground to the 'guest militants' playing the game of Pakistan's ISI. 'Unfamiliar with the language and local norms all 'guest' militants remain outside any restraining social influence." Not that the local militants are free from blame. "Local

Kashmiri militant organisations have also indulged in this heinous activity" taking and killing hostages

The people have nowhere to turn to. Their leaders are divided. The guest militants and even some Kashmiri militants misbehave. The authorities are callous and the security forces brutal. The objective behind counter insurgency is to single out and crush the Kashmiri militants and force the leadership to accept the terms and agenda set by the Indian government. In this process, control over militancy has slipped out of the hands of the Kashmiris to the guest militants. This suits the Pakistani authorities who want to exercise greater domination and find the non-Kashmiri militants better suited for their purpose. It is because of this that the escape of Mast Gul, fewer frontal encounters with the 'guest militants' such as in Char-e-Sharief and the targeting of the Kashmiris acquires significance. The danger is not that foreigners would move in and change the genetic purity of Kashmiris, a feeling both publicly and privately expressed. But that by allowing the well-trained guest militants to entrench themselves, an Afghan type war may get enacted. The lesson taught by Char-e-Sharief is that Indian security forces will pursue a scorched earth policy.

There is one saddening feature which only persons of sensitivity like the authors of the

report care to note – the contrast between the treatment of Kashmiris by the authorities and their behaviour towards Indians. "The contrast also comes out in the cockiness exhibited by Indian visitors from outside Kashmir when going to meet any official, especially a Kashmiri. We fix no appointment, we walk right in and at best request that we be allowed to meet the senior official. And even the non-Kashmiri Indian officials welcome us as people from back home. Since their interaction is from behind layers of security cordons, we even having a nuisance value, are accepted as a source of information for them. We have thus become a part of the complicity to divide the Kashmiri from the rest of the Indians without being conscious of it. In this twilight role lies a disturbing thought. To this one can only add that Kashmiris crave for sympathy in their plight and respond generously to sincere approaches.

This emerges also in the CTD-PUCI report on the burning of Char-e-Sharief by Kuldip Nayar, K. G. Kinniburgh, N. D. Pancholi and Joseph Gathu who visited the valley (May 27-30) and went to Char-e-Sharief for personal observation. The report demands inquiry into the outrage by a Supreme Court judge. It is less forthright and far less documented than the Report of the Committee for Initiative on Kashmir.

unorganised industries which has given rise to a corresponding form of the labour process with its implication in the potential for the growth of the trade union movement. The author argues that Indian industrialisation is closely linked to her colonial past (p. 21) and it has also been influenced by the dynamics of both global factors and national contingencies. However, the classification of unorganised industries (pp. 37-40) into 4 types is overlapping. The author has confused between the process of 'manufacture' and 'the objective conditions of work'. He goes with certain fixed notions like commodification, globalisation, colonial exploitation, which may not appeal to all types of readers in sociology.

Referring to his case study of garment industry in Delhi, Manjit Singh prescribes that unless the workers permanently uproot themselves from rural areas and secure some relatively stable jobs in urban industrial sector, it becomes a formidable job to organise them into trade unions (p. 78). The contextuality and feasibility of such prescription should have been appropriately worked out before prescribing it. A careful look at his detailed study reveals that out of total 84 pages, the author's case materials have found their mention only in some scattered 10 pages. Taking his limited data into account, the author has derived ambitious conclusions. The book would have gained stature methodologically had the author made mention of the characteristics of sample, the research design and techniques applied to collect primary data.

In an answer to the question 'who are the unorganised?' in the concluding chapter, the author aptly observes: "It is not that capital is unorganised, rather it is labour which is unorganised" (p. 82). However, the author should have read the original text of Keith Hart who not only coined the term 'informal sector' but also appropriately distinguished it from the one hitherto called 'unorganised sector'. But within the limits, the book appears like a conceptual source text on class emergence of classes, evolution of capital industrialisation process and trade union movement in unorganised industries.

Study of Unorganised Industry

Rabindra K. Mohanty

Labour Process in the Unorganised Industry: A Case Study of the Garment Industry by Manjit Singh. Manohar Publications, New Delhi, 1991. pp. 97. Rs. 100.

THE fastly growing urban informal sector in India has played a vital role in the development of country's economy by absorbing rural manpower and also by using capital saving labour intensive techniques to produce goods and services complementary to those of modern formal sector. Sociological studies on unorganised industries or urban informal sector are very few. Although economists and ecographers have hitherto dominated the discussions on unorganised industry, their attempts have many limitations. Economic research pertains to data which are open and as a matter of fact, mainly statistics of governmental origin. It emphasises on the macro research and not a micro research. Manjit Singh's micro study of garment industry in Delhi is one welcome addition to that speciality which has come to be known as 'Sociology of Unorganised Industry'.

The book under review consists of six chapters. To start with, the author tries to locate the conceptual confusions over the

term 'unorganised industry'. The author dismisses the definitional claims of some authorities on unorganised/informal sector with charges like 'limited', 'inadequate', 'inappropriate', 'lack of clarity' and so on. He makes an inappropriate claim that in spite of its (unorganised sector) major place in Indian economy, no serious attempts have been made even to give a precise definition of this huge sector. Several scholars in India have published works on the definitional question in the late 1970s and the early 1980s, about whom the author seems to be unaware. The author is advised to read especially I. S. Papola, Sethuraman, H. K. M. Singh and A. S. Oberoi, I. K. Majumdar, Heather Joshi and Amitabh Kundu.

The author's general theoretical discussion on the labour process and the capitalist development, 'the path of Indian industrialisation and the making of industrial working class, is broad-based and substantive. The focus is on the so-called determinate structure of the

Cultural Imperialism and Women's Movements

Sheila Rowbotham: Builder of Bridges

Vinay Bahl

The recent massive growth of multinational companies and their impact on women's conditions, the migration of women from former colonies and the emergence of movements amongst Third World women within the First as well as the Third World have brought into focus a new dimension of the women's question. Mere talking of individual identities and differences among First and Third World women will not help the cause of women's emancipation in either world. Instead we should start looking for linkages between different groups of women without undermining their specific histories or the distinctions of nation, race, gender, caste and class.

Sheila Rowbotham's writings should be read in the context of this need to create international links and bridges.

Movements develop in the process of communicating themselves. We have not even words for ourselves. Thinking is difficult when the words are not your own. Borrowed concepts are like passed down clothes: they fit badly and do not give confidence. We walk and talk and think in living contradiction.¹

SHEILA ROWBOTHAM wrote these lines in the context of feminists using male-centred languages and concepts. But I find these lines also useful to explain my dilemma as a third world (I recognise that it is not a unitary entity and in want of a better term I use it within quotes) woman using the English language and its concepts as well as western feminist concepts and categories. The problem is, as Raja Rao wrote in 1938:

One has to convey in a language that is not one's own the spirit that is one's own. One has to convey the various shades and omissions of a certain thought movement that looks maltreated in an alien language. I use the word alien, yet English is not really an alien language to us. It is the language of our intellectual make up like Sanskrit or Persian was before, but not of our emotional make up.

The above quote explains part of my problem in using the English language and also indicates that the language of intellectual make up has always been a language of the ruling classes of a particular historical time. This relationship between the language and the ruling class has created more problems for my authenticity (including proving my intelligence as it is considered synonymous with knowing 'good' English), earlier in India and now in the US. The authenticity of my 'Indianness' (a problematic concept itself) was distorted in India by a systematic suppression of the identities of various underprivileged sections of the society by British colonialism,² as well as in the independent India by the bourgeois ruling class, which got a substantial amount of support from the institutionalised Indo-Anglian literary critical tradition.³

The problem of proving authenticity is increasing with the pressures of the global market place which demand national allegory without making any effort to understand inter-societal linkages.⁴ Post modernism has given the greatest filip to this pressure by fetishising the notion of differences, identity and regionalism.⁵ Post modernist discourses have highlighted the inappropriateness of continuing to see ourselves as the victims of colonisation. The centre itself becomes periphery because of the plurality of meanings, the stress on specificity, plurality, regionalism, social minorities, on political projects (which are local in scope), on surviving traditions and on suppressed forms of knowledge. All direct responsibility had been taken away from us (periphery) by the power split between representation and what is represented.⁶ The logic of representation governs the fields of language, image, politics and our private lives. This logic is problematic because what is represented is presented in fragments. Not surprisingly, under these new discourses and forms of representations there is now a growing tension between global homogenisation and local cultural identity.

Similarly, in recent years the slogans of multi-culturalism are used to continually reiterate issues of difference and separation which have ensured the First World's global domination through their insistent segregation of the 'Other'.¹⁰ All our named distinctions—white/black, man/woman, straight/gay, plus all the hyphenated designations within nations and culture—both underpin and ratify their hierarchy. The mark of difference has been the inescapable burden of the 'Other' because it is always the second term that is 'marked' as secondary. The problem with multi-culturalist practice seems to be that it is trying to assimilate many different groupings and issues under one concept.¹¹ All significations are subsumed as undifferentiated, indistinguishable and interchangeable in a new sophisticated economy of 'sameness'.¹² Thus the centre, though claiming to be disintegrating still operates as the centre and

with exclusive rights over all the others.

In such a context post modernism in fact has proved to be a new trick of rhetoric. Nonetheless we (Third Worldists) should try to see if any of the concessions made by post modernism to the periphery can be of any critical value to us. It in fact could offer us the chance to reconsider all that was left unsaid. For non-western artists, intellectuals or feminists it is essential not only to be able to distinguish themselves from others but above all to create or recreate the historical and ideological conditions which at least provide the possibility to do so. Post modernism has no politics in the sense feminism has, because post modernism has no theory of resistance and no way to transform the structures of meaning.

Here then follows an argument in support of the theory of resistance in an effort to save myself (and others) from getting subsumed in the sameness process (as created by the modernity in the form of Third World as a unitary concept or its elimination by post modernism, which fetishises differences and reduces them into sameness). I am also using this opportunity to point to the alternatives available to us (all of us) and wish to emphasise an obvious issue which is generally overlooked by sociologists and historians as well as by feminists in their analysis.

The histories of all societies are also (along with the class struggle and external invasions/trade etc.) histories of inter-linkages between societies.¹³ There is no single permanently rooted static society. Some societies may take along in changing, but none of them are static. Those which remain static disappear. The changes occur not just because of internal forces or because of external forces. Both interact on each other, changes occur which create something new in all societies. Thus each society is linked to others, interdependent on them or even shaped by the processes of 'societalisation' that cut across them. This approach is 'problematic' because it is based on the premises of equality. Hence,

it does not allow any one society to take a privileged position and claim hegemonic power over the rest of people

Today, all of us ('Third' and 'First World') experience the pressure of contemporary global circumstances which are affecting every society and bringing changes (both intended and unintended violently or diplomatically, depending upon specific situations) in each one of them. In this perspective and context it seems illogical and unrealistic to interpret and analyse the experiences of people and societies as only a process of internal conditions (therefore, different) and create the phenomenon of Otherness. Instead, we should try to understand the contemporary hegemonic powers and forces, their ideological and other mechanisms of control and explore how they interact with different societies and shape people's lives and consciousness. Simultaneously, we must also find out how people are affected by interaction with new hegemonic forces. Because, often they do not passively absorb everything as helpless beings. In fact they may resist these hegemonic influences and develop survival techniques, sometimes as individuals or as a social group and sometimes as a nation. Once we understand these social processes, it may then be possible to develop proper strategies (as women, as working class and as 'Third World' people) for resistance and change in today's interconnected world.

Having this perspective in mind, I feel that if I have to constantly define myself in opposition to the constructs of otherness thrust on me, then that would be the surest way of othering myself. I am well aware that the moment one allows oneself to be subsumed within categories of otherness, one automatically empowers what one is set against. In this process we (those who are otherised) forget our own history and culture and attempt to find alternatives to the practices that we are criticising (both within our own cultures as well as in the adopted countries of our choosing). Moreover, my 'authenticity' is evaluated by the demands of the recipient culture (in this case the US), one that is selective in its criteria. Thus it seems there is a planned authenticity' at play everywhere creating problems for people like me who try to establish their 'authentic' identity. The monoliths of our times cannot be defeated through the construction of other monoliths. But through the creation of several voices of dissent, multiple points of attack and defence, sharply individuated yet linked. We need to reconstitute, reconfigure new narratives and languages that are pertinent to the secular culture of our times.

Let me elaborate on this issue with a personal example. My 'nativism' is questioned¹⁴ whenever I wear western dress or have a western hairstyle or am not sufficiently critical about western feminists

because, according to the post-modernist standpoint I can establish my nativism only by standing against the west (as different). Postmodernists refuse to acknowledge that people like me who enter into western culture are primarily there because of the history of world capitalist system, western colonialism and imperialism in effect leads to forced westernisation.¹⁵ To me this is one more aspect of cultural imperialism (along with other types) of the postmodernists who are forcing me to remain different native" (indigenous) even when for all practical purposes and for sheer survival it is necessary for me to communicate in a language that includes western cultural concepts and ideas, whether I wish it or not, whether it is at all possible to become native or indigenous in any pure sense of the term today. If I am not able to establish my nativism, in the sense western people understand it, I am labelled as too westernised and have no right to speak for natives. With this strategy two birds are killed in one stone without seemingly silencing 'other' women. Those women who by postmodernist standards can be called authentic voices, but are unable to come to the west and speak in the language which western feminist can understand and people like me, who could manage to come to the west, who have no right to speak since I am not considered 'authentic' since I belong to the middle class (a problematic expression in the context of US society). Thus ignorance is perpetuated about these 'other' women and this ignorance is justified in the name of 'lack of authentic voices'.¹⁶

Moreover, I am always being otherised (in India by the Anglicised academia and westernised feminists and in the west by the dominant culture of the ruling class including post-modernists) and I do not wish to accept hyphenisation of my identity or my work. I do not wish to be seen as anybody's other but as somebody who tries to define herself in opposition to certain monolithic others so that I can communicate and try to understand others. I find it equally necessary to explore my own self in relation to differences within my multicultural context in India as well as beyond. But I am compelled to remain silent, become 'different' or 'other' or get labelled with another unifying term such as 'Third World', which further contributes in widening the gap of communication. This enables some feminists (post-modernists including western and Indian) to keep harping on the question of 'differences' so that they can escape the need to understand these 'others' whom they have refused to acknowledge as a product of western cultural imperialism, a process imposed through the globalisation of the world capitalist system.¹⁸

Now, any theory, if it is to be of some practical use in the material world, must be capable of providing a tool to act upon

material reality as well as to explain it. That is what Marx meant when he said that it is not enough to understand the world but also to change it. The need for change is not an abstract or superficial wish for change for its own sake, as for example changing styles of dresses or experimenting with a variety of ethnic food. Let's have something new today. The absence of colonial flags in Asia or Africa today does not mean that we are living in a post colonial era. It only means that relations between First and Third World have become more concealed such as the debt dependency of Third World economies on First world and the aid packages offered by World Bank and the IMF. This wider context has created a link between the micro politics of the academy and the macro politics of imperialism. Therefore scholars both from First world and 'Third World' should not ignore the ways in which our investigative interpretive studies promote the designs of imperialism. As scholars we should know that what is at issue is not ultimate and transcendent truths (something mendicants had been doing for thousands of years) but the lived truth of specific human relationships in specific historical circumstances.¹⁹

Today the 'Third World' writers inhabit a space that is becoming increasingly difficult to negotiate due to the marketisation and marginalisation of dissent.²⁰ This problem has further increased as there do not exist many indigenous structures of production and representation. In fact this job is being done by globalising forces which are constantly homogenising 'indigenous' cultures everywhere. In this process of homogenisation of indigenous cultures the common heritage of mankind is created. This construct has become yet another universal up for grab, to be recycled, manufactured, marketed, priced and then sold back to 'Third World' in a new package. The idea of 'culture of choice' is promoted by a certain class of people with reference to the availability of different foods in the name of multiculturalism in metropolitan cities with catchy phrases of pluralism. This pluralism is the very product of a post capitalist post-modern conditions which can afford to indulge in an historic amnesia about those parts of the world where food may not be a matter of choice.²¹ "This form of globalisation of 'culture' has created serious problems for those 'Third World' women who are different but are also part of the western culture as a result of colonialism as well as of their own migration to the western world.

It is this specific historical context of mine which makes me raise the question of creating bridges and not repeating the discussion on 'differences' or 'victimisation' or even 'multi-culturalism'. Sheila also points out in *Women in Movement* that "to simply

present 'difference actually disguises inequalities among the vendors [women]' By insisting on 'difference' it is possible to treat these women with inequality because in this way they are not comparable in any respect at all. She comments that this particular theoretical tack in feminism has thus pulled the rug from under feminism as politics.¹ It is with these dimensions of cultural imperialism in mind that I am attempting to read Sheila's writings.

COMMENTARY ON SHEILA'S WRITINGS

In this paper my effort is to show that Sheila's commitment to a vision of a humane society (which includes women) directs the course and contents of her writings. It was her political perspective which made it possible for her to look for bridges rather than otherising women. The idea of creating bridges has been picked up in recent years by many women in the world and I find Sheila's writings make a contribution to that tradition. The fact that today's Third World countries were once colonised and are even now being exploited in the globalisation process is undisputed. But the postmodernist approach, which sees language as slippery, has compromised the historians' ability to identify facts and chronological narratives by reducing to mere subjective stories 'the experiences of women struggling (in the 'Third World') to define themselves in particular historical contexts. This approach has already begun to isolate women's history from the women's movement. It tends to paralyse the women's movement politically through depoliticising gender. This separation of women's history from their movement has important implications for the women's movement in the Third World because it coincides with a moment at which minority groups (within US as well as in other countries) are finding their voices and speaking out with some sort of collective identity.

Third World gender construction (as is created in the west) took another turn with the emergence of neo colonialism. A process of neo colonisation has emerged with the development of a communication network which can shuttle information instantly around the globe and help multinational corporations to reorganise the flow of labour, capital and control across national borders. The earlier achievement of 'autonomous' (freedom from physical colonisation only) nationhood has been rendered almost irrelevant by the accelerated circulation of goods, money and culture. Within this new context feminist theories have now hypothesised a universally colonised 'woman' universally subjected to 'patriarchal' oppression thus effectively stripping the colonised subject from its agency.²⁶

I wish to emphasise that if we (both 'Third World' and western feminists) genuinely care to change women's condition all over the world, then western feminist scholarship (including the postmodernist trend in the non western world) can no longer avoid the challenge of situating itself and examining its role in such a global economic and political framework. For this essential work it is necessary to forge links between women's political struggles all over the world. This in turn requires an understanding of the complex interconnections between 'First' and 'Third World' economies and their effect on the lives of women in all countries. Literature on this subject is already emerging.²⁷ Links are already being achieved to some extent in international declarations such as those by the First Women's Conference on Security and Cooperation in Europe 1990, Isis International 1990, Mujer/Impress 1991, South Asian Feminist Declaration 1991.²⁸ These international links are based on cross national or global problems and the interrelation of women's emancipation and other emancipatory struggles. International surveys and articles with titles such as *Sisterhood is Global or Planetary Feminist*.²⁹ They are based on assumptions of a 'shared identity' (in the sense that all these women are being exploited by Multinational/Transnational Corporations) and common response or lack of it.³⁰ These women have recognised that it is impossible to think of either the historical or the contemporary experience of nationalist women's movements in isolation from each other. These advances in the level of discourse of women's organisations represent a step towards the making of international feminism through creating new bridges.

Sheila's writings should be read in this tradition of creating international links and bridges. All her works have stemmed from her active participation in the women's movement in Britain and her commitment to a humane society and to the search for social justice. This goal is fundamental for the women's movement. As she wrote in *Beyond the Fragments*:

Feminism for me is a movement to assert the interests of women as a sex. But more than this it is a means of releasing and communicating the understandings which that subordination holds in check. The movement for women's liberation is part of creation of a society in which there are no forms of domination. This society cannot be separated from the process of its making.

Feminism like socialism, is a political historical movement with different strands in it.³¹

In Sheila's earlier work she looked at women in revolution. Then she shifted the focus to women's struggle in day-to-day life. Later she attempted to develop an

analysis of sexuality and personal life together with its political implications – still keeping socialism, feminism, and activism together. Sheila explains about herself in these words:

I became interested in the history of women in revolutionary movements. This was the source for *Women Resistance and Revolution*. I was focusing on the history of women and socialism rather than the history of feminism. I am interested in how history related to people that keeps it alive. My work has often been influenced by my teaching *Hidden from History* for instance was written for WEA students who were housewives in the suburbs and didn't have much time to read. They needed something that could be read in short sections and had complained the *Women Resistance and Revolution* was a bit remote. The chapters were too long. I wrote that book for them but it has also been quite popular with trade unionists perhaps because with a different working pattern they also have short bursts of time. There was a very organic connection between our historical work and our political work. Ideas about women's history have developed from many group discussions.³²

Early on Sheila was aware of the fact that the should not apply western assumptions of oppression to understand women of other countries. Later, she also warned that western feminists need to be very careful. In an interview to MARHO she said:

I remember when I was doing *Women Resistance and Revolution* a friend who influenced me a lot was Hermione Harris, an anthropologist. She and other women anthropologists have stressed the dangers of imposing aspects of western feminism on other countries. Some of our problems don't seem quite so acute. I think that the most crucial thing feminism as I understand it has been saying that is relevant both in western capitalism and the Third World is that our need is to change relationship between people in the very process of fighting for revolutionary change – but I had learned it through history (also).³³

Reading Sheila's books, listening to her talks and knowing about her commitment to a vision of a humane society, I think Sheila is able to provide a way out of the dilemma created by western feminism without in any sense stripping 'Third World' women of their agency. It was possible for Sheila to achieve this linkage because her approach is based on actual actions in the field of women's movement amongst both white and coloured and including 'Third World' women living in Britain. She learns from women who are struggling to improve their lives as well as their living standards and trying to make sense of their existence. Her own life is full of such examples. She does this in England as well as by going to other countries and making contacts with

women who are in the field writing, struggling, and working. She perceives these struggles in terms of her own belief of changing society for all the downtrodden including women. For this reason her books are being translated in many languages of Third World countries and people can relate to them.

All of us (people in general) are struggling to survive in modern times against the vast influence of capitalist system and its institutions. This vast influence of capitalist system give us a common ground for understanding each others' problems at the work place and also the socio-political-historical-cultural influences on our lives.⁴⁰ The massive migration of ex-colonial population (because of the demand for cheap labour) to the industrial cities of Europe and the US has created new kinds of multiethnic and multiracial social formations. This new situation as well as the tension and conflicts it creates, can be comprehended only through cross-national and cross-cultural analyses.⁴¹ Keeping these new realities of the contemporary world in mind Sheila describes in her recent book *Homeworkers Worldwide* the growth of a Third World within the first. She highlights an important fact that several organising initiatives among Third World women workers outside the conventional situation of highly organised western trade unionists have challenged the fatalism which assumed that poor women were not organisable.⁴² She does not stop at admiring this development but raises the question: what can be learned from such experiences of organising amidst adversity? She explains what she learnt from the efforts of Third World women in the following terms:

In 1987 I visited India and interviewed women involved in various forms of co-ops and trade unions... (in) Gujarat where the Self-Employed Women's Association (SEWA) has successfully organised 40,000 women who are vendors, contract cleaners, agricultural workers, construction workers, as well as homeworkers working in clothing, basket making, handrolled cigarettes.⁴³

What was occupying Sheila's mind was the question: can "it be duplicated" was it specific to the conditions in Gujarat and the particular economic and political traditions of organising through the textile industry and Gandhian politics?⁴⁴ She found her answer in Sheffield where she went to a small conference which was organised to discuss the problems facing workers in Britain because of the growth of flexible forms of work. 'Flexibilisation' was the part of casualisation of the labour force. One aspect of the flexibility has been the use of homeworkers rather than direct employment of factory workers. In this conference while hearing two homeworkers speaking about the conditions in Mixenden, West Yorkshire,

Sheila felt the need to make a connection between the organisation in Ahmedabad and the fears and isolation experienced by the homeworkers in Britain.⁴⁵ She was not thinking of these women as Third World of Others.⁴⁶ For her it was the need to bring the experiences of different women in different areas and nations on the same type of problems together so that they can benefit from each others' experiences, struggle and organisation. She saw the homeworkers phenomenon in Britain and in India as a product of a global process of capitalist relations rather than as problems specific to women of the Third World. From that perspective, he did not waste time in emphasising questions of others or identity. Instead she proceeded to organise a seminar which began to look at emerging organisational forms among casualised women workers and to network with women's groups and researchers. She reports in her book that soon thereafter homeworkers themselves began to make global links.

She correctly points out that historically this [global links of homeworkers] is of tremendous significance. It indicates the possibilities of a new kind of labour movement which challenges hierarchies of race, ethnicity, gender and class.⁴⁷ Global links of homeworkers contribute to a new kind of internationalism.⁴⁸ This new form of internationalism is created by those women who were considered to be unorganisable. English peoples' ignorance (or misconceptions) about other countries is revealing when Sheila points out that the English audience was clearly surprised to learn that in India there is a legal minimum wage.⁴⁹ She further explains that

[this] organisation of homeworkers is not simply an economic matter about low pay, or even work related problems to do with tax and National Insurance. It is also closely linked to a sense of identity and consciousness of self in relation to a social situation. Consequently the group in West Yorkshire has included areas of development and confidence building which are wider than those often tackled by trade unions which have tended in recent times to focus mainly in the workplace.⁵⁰

These (homeworkers) women are not just Asian, Chinese, Indian, Pakistani but also include white women. "Homeworking groups in Britain and Holland now are lobbying the EEC to recognise homeworkers' conditions and make legislation in the different European countries more similar."⁵¹ She noted that this kind of international comparison breaks the feeling of hopelessness which is an obstacle against the organisation of homeworkers. Even limited gains give ideas of what might be attained.⁵² These homeworkers' organisations are also backing SEWA's work with the ILO and linking with trade unions

internationally. They have shown the capacity to cross over the boundaries of production and reproduction, labour and community, economic and social issues.

Sheila urges us to understand how all the sources of resistance could combine and strengthen one another. Thus associations among poor women workers clearly could have more general implications for trade unionism which link economic and social demands, spinning workplace and community needs.⁵³ Most important of all the SEWA group realised that

neither growth nor equity follow each other automatically, whichever you take as your starting point. We need instead explicit strategies for democratic structural change that would enable people to liberate themselves from the oppressive social structures which perpetuate their dependency and their powerlessness.⁵⁴

These themes are further developed in Sheila's more recent book *Dignity and Daily Bread*. It presents perspectives which subvert the assumption that new cultural forms and their theorising originate only in the north.⁵⁵ An artificial separation of women and development issues in the Third World from the study of the economic and social circumstances of class, gender, race and ethnicity in the First, is being increasingly challenged. Sheila maintains that a significant social process is occurring, but the new forms of organisation emerging among poor women producers are still fragile. Therefore *Dignity and Daily Bread* should be seen mainly as opening an area of enquiry for the study of new kinds of organising poor women around production in different parts of the world.

This book urges women of the west to learn from the experiences of Third World poor women who are resisting and surviving exploitation by multinational corporations. Sheila writes:

we [people] are left with a vacuum in which the arbitrary criteria of the market and the interests of multinational capital predominate.

The experience gained by Third World poor women in developing forms of survival and resistance are becoming increasingly relevant to women of the First World. Women's mobilising experience also challenges the prevailing assumptions of who constitutes the working class and how class is to be defined.⁵⁶

She notes that SEWA has had an important international role in Europe and Canada as well as in the Third World where organisation of casual workers is emerging in countries like the Philippines. 'Synthesising old and new forms of organising will be the work of the future - that future whose outline we can as yet barely discern'.⁵⁷

Such bridges as Sheila is able to create are needed because today women's condition

INDIAN JOURNAL OF GENDER STUDIES

Edited by Malavika Singh
Centre for Women's Development Studies,
New Delhi

The journal is...a valuable source for those interested in women's studies, gender issues and development issues, especially in the context of contemporary India

cannot change unless connections can be made with so-called 'others'. Lessons can be learned from those 'others' by women who are not tied up with the problem of differences or with decontextualised identities'. Rejecting the concept of identity (as propagated by postmodernists) Sheila points out in *Women in Movement* that

The problem with the concept of identity is that it tends to become rigid, fixing individuals artificially into a single aspect of their lived experience. One of the most fascinating puzzles of history is the attempt to understand how people came to identify with groups and causes in particular times and places. Does a consciousness exist before it has expression philosophically, politically, organisationally?⁵⁸

Sheila gives the example of Charlotte Woodward who 'believed that her position as a woman in the economy was the crucial reason for her low wages. But in the same period many women in the British Chartist movement campaigning for the male franchise believed they were oppressed not because they were women but because they were poor. They interpreted similar circumstances in a different political language of class'.⁵⁹

Furthermore, Sheila is able to create ground for bridges and international links between women by demolishing the myth that emancipatory ideas had developed only in the west. Sheila pointed out in *Women Resistance and Revolution* that we do not develop ideas in isolation and this is more so for liberationist ideas,⁶⁰ since ideas come from the experiences of our lives, from the past wisdom of others and from the movement for change.⁶¹ She writes that a convergence of western and eastern reforming strands appeared in India in the early 19th century.⁶² Elaborating on this issue in the *Past Is Before Us*, Sheila has written

[The] national boundaries cannot contain the movement of feminist ideas. Influences have travelled from North America and Europe. Now there is a growing interaction with women in the Third World, which has been documented in the magazine *Outwrite* and increasingly in *Spine Rib*—the thought of a social movement is not packaged neatly between two covers. Anyone who has been an active participant in politics knows people do not all sit solemnly reading a book and then march off to make strategies and programmes. There is less conscious process of political thinking in a movement, untidy for historians to be sure but fascinating nonetheless.⁶³

More recently, Sheila writes on the same issue that,

although international interactions resulted in theoretical crossovers, every new beginning has assumed differing shapes. It is as if thousands and thousands of women

were busy making a gigantic garment borrowing and creating their own patterns. Despite varying emphases there have been common themes and common problems and over time several attempts to unravel the knitting and make fresh starts.⁶⁴

While pointing to the international links between women's movements and the interaction of ideas, Sheila argues that the development of ideas itself is an integral part of the movements. One cannot develop without the other. She explains on the basis of her own experience that,

Without a movement as a reference point without the ideas expressed in that movement and without the constant support and help of the women I know in women's liberation I would never have written more than a fragment of this. Women's liberation brings to all of us a strength and audacity we have never before known. I am not however speaking for anyone. What I write is simply a contribution to a permanent communication which comes from me personally but only exists because of other women. An individual woman who appears as the spokeswoman for the freedom of all women is a pathetic and isolated creature. She is inevitably either crushed or contained as a sexual performer. No woman can stand alone and demand liberation for others because by doing so she takes away from other women the capacity to organise and speak for themselves. Also she presents no threat. An individual 'emancipated' woman is an amusing incongruity, a titillating commodity easily consumed.⁶⁵

This relationship between collective action and women's emancipation is of special significance because, as Sheila points out, by standing alone individuals women can take away from other women (and people) the capacity to organise and speak for themselves. Moreover, a lone voice claiming liberation represents no threat. While rejecting the notion of individual liberation, Sheila maintains that the women of colonised countries have to fight their own battles within their own countries and to find new meaning for their lives.⁶⁶

Clearly, Sheila is aware that none of us (women in colonised countries and the rest of women) can know how the new struggles would emerge, what interpretations would be given to women's movement, or what ultimate form it would take. This uncertainty and unpredictability arises because there are no clear maps or trodden path available to women in their struggle for emancipation.⁶⁷ The lack of blueprints and lack of theories to follow make women's movements complicated to understand and explain. Women join collective actions for different reasons at different times and in different places. Many women participated in social protest action because of their own historical reasons. Their movements did not arise simply on the basis of ideas taken from the

outside.⁶⁸ In the process of struggle each group of women developed its own strategies and its own interpretations of the question of equality. Sheila writes, 'aspirations for difference and equality express the conflicting realities in which women are situated in society. Thus in some circumstances, equality with men seems desirable, in others it does not meet the needs of poor women'.⁶⁹

There are many examples of women entering a public political sphere for humanitarian reform as mothers. Actions based on this gendered relationship have been both apart from and connected with feminism.⁷⁰ Moreover, all women do not demand the same level of equality with men. In many cases, women demand peace sometimes as mothers, sometimes as political 'human beings'. For an ambivalence still exists about whether to value one's difference or challenge male colonisation of universal concepts.⁷¹ The process of liberation remains difficult to understand since mothers can be at once revered and marginalised,⁷² as was evident in the mobilisation of women in nationalist and socialist movements. The various social, economic, political, international and cultural factors which inform women's actions and the nature of their demands, provide the reasons why many women's movements are not revolutionary in the usual sense. Even when women's movements are not revolutionary, the demands women make for their own improvement require such a fundamental change in society that they are completely inconceivable without revolution.⁷³

Sheila correctly emphasises the relationship between the making of feminist theory and women's living experiences, theories evolve in the interaction between these two processes. Accordingly, there cannot be any single theory or any universal model for the women's movement to follow. She writes

Our efforts to abstract upon or practice and history through theories of how to make socialism for example are not good for all time to be handed on like dusty catechisms repeated by rote as correct thought. They have no universal validity. If they serve more than their time well and good. But this does not make them sacred texts. A movement helps you to overcome some of the oppressive distancing of theory and this has been a considerable and continuing creative endeavour of women's liberation.⁷⁴

Elaborating on this point, we can say that women became aware of many aspects of the capitalist system in the process of their struggles. This awareness led to new forms of resistance and new theoretical interpretations, which in fact removed the distinction between public and private.⁷⁵ Sheila also warns us that our theories should

not be written in coded words comprehensible only by the educated elite.⁷⁴ In fact postmodernist language cannot be understood even by educated people most of the time, as became clear at the session honouring Sheila at San Francisco in January 1994.

Sheila true to her humanistic approach reminds us of the danger of promoting gender based oppression theory because women's experiences are within the same society where men also inhabit. The existence of a women's movement affects men as well as women. It is not just a matter of the ideas but the relationship to them. We need to create as well as oppose. The implicit understanding of this has been one of the strengths of feminism. Creativity involves transformation by going beyond yourself.⁷⁵ The feminist approach to consciousness perceives its growth as many-faceted and contradictory.

Today it is accepted within the women's movement that we are all equally responsible for generating ideas and ways of resisting a society we oppose, and thinking critically about theories of organisation.⁷⁶ It is increasingly possible to relate to experiences of other women because 'The ideal is an openness and trust, a recognition of other women's experience as well as our own. This collective experience has been a vital force in the women's movement's strength. I [Sheila] see no reason why it should be gender bound'.⁷⁷ At the same time Sheila explains that it is not enough to understand complexity in the personal perceptions of human beings because 'such consciousness does not of itself alter the social conditions that produce it'.⁷⁸ The social conditions also need to be understood. For example, women in Latin America demonstrated and organised alternatives not because there was a feminist movement but because they could not feed their families. Though these movements did not arise from feminism, certain similarities emerge. Women in social protest have partially found a language through feminism, their action and demands raise many questions about existing theoretical paradigms. An active awareness on one issue can lead to the result that other issues take on new perspectives. For example, race and class protests may kindle an awareness of gender.⁷⁹

In conclusion, I emphasise Sheila's insistence that the consciousness of women about themselves does not develop in the same way at every place or for every class. Women perceive themselves differently depending upon the social, political, economic, cultural and historical context. Women's consciousness does not necessarily and automatically translate into feminist consciousness or revolutionary consciousness. Ideas travel and women learn from each other in the process of struggle. Interaction serves to raise further questions.

Theories and ideas which develop in this fashion can be used by feminist and other women's movements to articulate their own experiences and concerns. The existence of women's movements also affects men. Since the women's movement is a very complex process there is no fixed 'sacred' theory or path for it to follow. But the goal is clear: to create a humane, free and just society, and this goal should be the guiding principle in developing theories for women's movement as well as for society as a whole.

The recent massive growth of multinational companies and their impact on women's conditions,⁸⁰ the migration of women from former colonies and the emergence of movements amongst the 'Third World' women within the 'First' as well as in the 'Third World' have brought into focus a new dimension of the women's question. Mere talking of individual identities and differences (as postmodernists suggest) amongst the 'First' and 'Third World' women will not help the cause of women's emancipation in either world. Instead we should start looking for linkages between different groups of women without undermining their specific histories or the distinctions of nation, race, gender, caste and class. The world can come closer to being a better place to live in if women take initiative to create bridges and refuse to play into the hands of imperialist economic, cultural and political forces.

Notes

[A shorter version of this paper was presented at the 108th Annual Conference of the American Historical Association held at San Francisco, January 6-9, 1994, in the session 'Women's Revolution: The Work of Sheila Rowbotham: A Twenty-year Assessment'. The longer space devoted to the introduction than is convention stems from the problem that I am an Indian coloured woman assessing Sheila, a British white woman, and agreeing with her. This situation needed a proper explanation because the fashion of the time is 'differences'.]

8 Herta Wolf, 'Notes on Mistaken Identities', *Third Text*, 24, Autumn 1993. On the appropriation and repackaging of 'Third World' culture, Rustom Bharucha (op cit) wrote the following:

More problematically, I found that its (interculturalism) practices cannot be separated from what could be described as a neo-colonial obsession with materials and techniques from the third world. These resources being primarily on our traditional disciplines, our modernity being of no concern to most interculturalists, have been recorded, transported, appropriated and transformed into the scenarios for other audiences. Kathakali, yoga, breathing exercises, Kundalini and marital arts have provided the base as it were for new science of acting and anthropology of theatre where laws and rules of behaviour relating to the energy and pre-expressivity of actors have formulated at transcultural levels (i.e. cutting across the specificities of particular cultures). We need to ask ourselves whether the bios or being of an actor from a particular culture can be separated from his or her ethos. Can stories be extracted from the multiple and contradictory ways in which they are told to their own peoples? More problematically, can the pre-expressivity of theatre be decontextualised and 'restored' into techniques or performances? These questions may be rooted in theatrical context but they have resonances that extend to our confrontation of 'other' cultures at more general levels.

55 The point is whatever helps in creating bridges should be done rather than get caught in abstract theoretical problems for the sake of theory. There is no sacred theory to follow. To me the important thing is how to make life better for women as well as for all the down trodden. That should only be the guiding principle and not to try to fit in any particular theoretical model, either postmodernist, or neo Hegalian or any other. It is well known that all societies do borrow from one other, ideas, customs, plants, technology, etc, sometimes forcibly, sometimes diplomatically or through trade. I am suggesting that we follow a conscious strategy of borrowing ideas from wherever we can, and develop a strategy so that the direction of change remains in our own hands (and not wait for a brain wave from a theoretician or a politician) in order to get nearer to our goal.

Concept

THOUGHTS OF GANDHI AND VINOBA

A Comparative Study

K. S. Bharathi

Hardbound

Rs. 300

An attempt has been made in this book to bring about a comparison between Gandhi and Vinoba. Vinoba most legitimately and appropriately claims to follow not Gandhi the man, but Gandhi the IDEA. Today, almost everyone in India concedes that Vinoba is the nearest and truest follower of Gandhi. The life and work of Gandhi and Vinoba has been discussed in the first Chapter. Philosophical thought of Gandhi and Vinoba has been covered in the second chapter. The next four chapters analyse the ethical, social, economic and political thought of Gandhi and Vinoba. The educational thought of Gandhi and Vinoba has been discussed in the last chapter.

Dr. K. S. Bharathi is a faculty member in the Postgraduate Department of Gandhian Thought of Nagpur University, Nagpur.

Judiciary, Social Reform and Debate on 'Religious Prostitution' in Colonial India

Kalpna Kannabiran

'Devadasis' have been a subject of apparently opposed discourses for over a century and a half. On the one hand various perceptions of them in the colonial period converged in a strong disapproval and condemnation of their moral conduct. On the other hand, both in the colonial period and, more importantly, in post colonial scholarship, the fact that some of these women were performing artistes of repute provided the ground for a feminist resurrection that separated them from those that did not belong to these privileged traditions and placed them in a newly created space that redefined and respected their freedom, autonomy and creativity.

This study of the devadasi institution was undertaken with a two-fold purpose. First, it was an attempt to understand the relationship and shifts in it among women, religion and the state in pre-colonial and colonial south India. The second purpose was to try and disentangle this complex process, specifically to see how far the projects of colonialism, reform and revival were based on an understanding of the material reality of the practice.

THIS article examines the official debate in the colonial judiciary on the devadasi institution of the Madras presidency and the creation of a new body of knowledge on this institution and the legitimising and dissemination of this knowledge by the different strands of social reform movement.

Devadasis have been for over a century and a half subject of apparently opposed discourses. On the one hand various perceptions of them in the colonial period converged in a strong disapproval and condemnation of their moral conduct because they were not monogamous and could contract sexual relationships with more than one man within certain other constraints. On the other hand, both in the colonial period and more importantly in post-colonial scholarship, the fact that some of these women were performing artistes of repute provided the ground for a feminist resurrection that separated them from those that did not belong to these privileged traditions (separations that were, I suspect, congruent with caste and class divisions within this diverse 'community' of women), lifted them – literally and figuratively – from their debased immoral contexts and placed them in a newly created space that redefined and respected their freedom, autonomy and creativity [Kersenboom Story 1987, Marglin 1985].

This study of the devadasi institution was undertaken with a two-fold purpose: first, it was an attempt to understand the relationship, and shifts thereof, between women, religion and the state in pre-colonial and colonial south India. The second purpose was to try and disentangle this complex process, specifically to see how far the projects of colonialism, reform and revival were based on an understanding of the material reality of the practice.

The period (1860-1935) covered in this article is significant for two reasons. Firstly,

the social reform movement, the nationalist movement and the non-brahmin movement were at their peak during this period in the Madras presidency. Secondly, and of significance to the present argument is the fact that although these movements had strongly divergent trends, there were areas of overlap in their agendas which gave rise to very different articulations and interpretations of similar concerns. The devadasi institution was one such area of overlap. Broadly all three movements were concerned with achieving political independence, asserting a national/cultural identity and purging society of all its evils, thus paving the way for a free, equal and modern society. The creation and assertion of this identity, as Kumari Jayawardena points out, was itself directly related to the growth of imperialism [Jayawardena 1989:4].

I

Devadasis and Legal Discourse

In the early 19th century, an important task of the colonial government was that of documenting native religious practice in a manner that would bring it as close to the brahmanic textual tradition – which was itself a product of the official discourse and involved the privileging of western ideals of consistency and in uniformity over variations in indigenous interpretation – and in a manner that would uphold the essential morality of the brahmanic ideal as defined by the colonial state [Niranjana 1990:773-79; Chakravarti 1990:27-87; Mani 1989:88-126]. After 1868, the year of the landmark case, *Collector of Madura vs Mootoo Ramalinga*, custom could override the written text of law if its antiquity was proved. Despite this, the concern over 'moral degeneracy' of the Hindus haunted the official legal discourse on any matter relating

to the devadasis – and therefore the debate over whether or not custom could override the written text was opened up again. After the Indian Penal Code was formulated in 1861 there were, generally speaking, two kinds of issues that came up for adjudication under sections 372 and 373 which enabled prosecution of people involved in the disposal or procurement of a minor girl for purposes of prostitution. The first – and one which addressed itself directly to the moral question – related to whether or not a devadasi could be charged of prostitution which, under the Indian Penal Code, was a classified offence. This issue generated a very complex debate among other things, on the true Hindu tradition. Deeply entrenched in this conception was the ideal of Hindu womanhood constructed through Orientalist scholarship on the Indian past that was in turn based on the study and resurrection of a pure brahminical/sanskritic textual tradition. This ideal was also therefore the foundation, in a sense, on which Orientalist scholarship on Hinduism was based. The ideal projected the vedic/uran woman as the embodiment of Hindu culture and also as the ancestor of women in colonial India. As with the debate on sati and social reform, this notion of womanhood privileged a high caste textual tradition that had opened and offered itself to colonial intervention [Chakravarti 1990; Mani 1989]. The vedic/dasi, for instance, as Chakravarti points out, found no place in this colonial scheme [Chakravarti 1990].

This is no doubt because the weight of the history of subjugation and oppression that the vedic/dasi bore on her shoulders crossed the threshold of colonial tolerance. And clearly, the threshold itself is determined by the interests of the colonial state to keep histories of subjugation, problematic histories, out of the reckoning. It was not, however, just the vedic/dasi who were out

of the colonial schema. All those women in colonial India who could not lay claim to the genealogy of the aryan woman – chaste monogamous high caste pure – were also pushed out. There was a definite process of selection not just of historical antecedents but of contemporary subjects.

A further point of significance is that the processes of exclusion and/or co-optation intersected with class and discursive space in ways in which the impact was different on different women of the same community. Some of the more affluent and publicly visible members of this amorphous group openly adopted marriage reform as a political statement thus also situating themselves within the context of social reform which advocated marriage reform. The large number of poorer members of the community were charged with prostitution by the colonial judiciary whose object is distinct from the object of reform was to interpret practice not reform it. Marriage reform therefore did not form a part of the discourse on the devadasi question in the colonial judiciary. In this specific instance the closer the interpretation was to prostitution the more effectively it served the purpose of the law.

DEVADASI AS PROSTITUTE IN BRITISH PENAL LAW

Charging a devadasi with prostitution should be seen as an attempt by the colonial government to resolve its own contradictions in bringing the entire Indian population within its ambit either through a process of exclusion (through the criminalisation of social practice) or through co-optation (via marriage reform). Predictably the most unacceptable part of social organisation of this group in the eyes of the British was the legitimate multiple sexual relationships the women entered into. That social practice in the devadasi community was tied to and in a sense defined by an upper caste brahminical norm even in pre colonial society was irrelevant to the new administrators. The argument therefore that the colonial administrators and the orientalist before them sought to create recognisable bourgeois patriarchal ideals out of a range of pre-capitalist patriarchies acquires a new relevance here. The only way the devadasi could be fixed within the colonial scheme was by shifting her out of the religious sphere (where barbarity if located within the Hindu family was tolerated even encouraged by the colonial government) [Mani 1989] to the secular sphere where she could be charged with an offence, prostitution, that came within the purview of British penal law. I would argue that the shift effected by the colonial state driving out the devadasis from the purview of religious law into that of secular law

necessarily entailed a shift from proof of the offence to a speculation on the motives of the accused. Proof, thereby came to be constituted by the painstaking orientalist discourse on Hindu society rather than by the facts of the case. To say that the judicial system and the battery of principles of utilitarian justice were used by the state to construct the truth behind Hindu religious practice hence justifying colonial intervention would be to state the obvious.

Not surprisingly prostitution was a charge that could not be easily proved because colonial and native conceptions of prostitution differed to begin with. Even assuming that prostitution (in the sense of commoditised sex) was widely prevalent in India the probability that it was not an offence or crime (in other words that it did not constitute deviant behaviour) in pre-colonial India would of itself have negated the British charge. Framing this charge therefore was not as simple as the British perhaps anticipated.

Early in the history of British penal law this charge was framed by accusing the women not of prostitution but of the disposal or procurement of a minor for purposes of prostitution. That this charge could be framed at all was because adoption of female children was customary among devadasis and the prevalence of this custom was exploited by the judiciary. The following excerpt from a judgment gives us the general narrative framework of official discourse:

Every nautika must needs be a harlot. She is taken as a child. She is taught lascivious arts forbidden marriage but wedded to a dagger [sic] by rites of corrupt significance and then at the moment of aptitude sold to some epicure in licentiousness. Her livelihood thenceforth depends on her zeal and skill in her base profession. Dancing and singing are subsidiary accomplishments but they are subsidiary only to simple harlotry. As the nautika herself wanes in attractiveness she must adopt a daughter if nature has not provided her with one and as a severance is strongly opposed to the class sentiment the worn out harlot recoups herself for the past by inflicting a like wrong on a new victim. Thus the evil system is perpetuated from one generation to another and it may be that, as long as a coarse sensualism prevails amongst a wealthy class the means of inflaming and gratifying their libidinous tastes will not be wanting.

It would be interesting to look at the facts of a typical case in which the father of a girl is charged under section 372 of the IPC.

In this case 1st prisoner presented an application for the enrolment of his daughter as a dancing girl of the great pagoda at Madura. He stated her age to be 13, and it has throughout been admitted that she is under 16. She attained puberty a month or two after her enrolment. Her father is the

servant of a dancing girl, the 2nd prisoner who has been teaching the minor dancer for some 5 years. Her father and herself live in the 2nd prisoner's house and after the ceremony returned there. [B]oth 1st and 2nd prisoners were present when the Bottu was tied and other ceremonies of the dedication performed. 3rd prisoner, Battar of the temple was the person who actually tied the Bottu which is equivalent to the Tali of an ordinary marriage and denotes that the Dasi is wedded to the ido. There is the usual evidence that dancing girls live by prostitution the fact being admitted it was not necessary to multiply witnesses on this point.

The reluctance to multiply witnesses was also in large measure because witnesses resisted the inference of prostitution. The only evidence they unequivocally testified to was regarding the actual dedication ceremony. To frame this charge therefore the judiciary had to rely on [t]he implicit admissions of the witnesses who resist the inference no less than the direct evidence of those who assert that inference to be irresistible [that] renders it abundantly clear that girls so sold and so registered are brought up as prostitutes and that one principal purpose of such a transaction is that the shall be so brought up. This inductive reasoning was deemed valid by the law courts because the Abbe Dubois and many other authorities had placed the matter beyond historical doubt.

Characteristic of this stand was the statement of a moral nature prior to an account of the practice. Needless to say the account of the practice itself is woven into these moral webs and made to constitute the new truth about the essence of the system that bore little relation to the actual history of the practice or to the complexities inherent in the practice even in the 19th century.

For the colonial government however the devadasi practice, which was in strict accordance with personal law violated the spirit of public law itself. The resolution of this contradiction was far more crucial than the immediate issues in question. The initial exercise of the courts in privileging the textual tradition over the customary or oral tradition now shifted to the privileging of Penal Law which was based on universal principles of the science of legislation, over Hindu law both textual and customary. The attempt to effect this shift became necessary because such prostitution [was] strictly in accordance with Hindu law and customs and a judge [up to this point] was bound to pass a decree which was in conformity with private law.

The British judges generally felt they could ill-afford to turn a blind eye to the main purpose of the devadasis' profession – prostitution. Although the issue in question related to religious services, 'it is still

impossible to regard their religious services as disconnected from the other inevitable pursuit of their profession as devadasis'. Recognising custom, they felt, was giving sanction to 'an association of women to enjoy a monopoly of the gains of prostitution, a right which on the score of morality alone, no court could countenance' (emphasis added).¹⁰ In their view a practice founded on error and misconception could not constitute customary law by the mere fact of repetition. A blind adherence to usage which was against public interest and in the process of extinction would work to the detriment of social progress. The court therefore reserved the right to overrule a custom which violated natural reason.

In charging the devadasis under sections 372 and 373 of the IPC the colonial government was striking at the foundation of family structures and domestic organisation of the colonised. These sections were used to interpret the customary practice of the adoption of girl children by women of the devadasi community. The accused in each of these cases was a close relative – often a parent – of the minor girl. In calling into question the motives of parents of an entire community, therefore, the colonial state recognised that if the justification for colonial rule was to be provided, it would have to be predicated on the nature not just of natives but also of native institutions and their functioning – the family being the crux of native institutions for the colonial state.

LEGAL DISCOURSE AND DEVADASI INHERITANCE

Hindu Law – the very texts the colonial judiciary relied on – sanctioned the existence of courtesans and their rights to property. Also the laws of Manu which were given immense credibility by Europeans, sanctioned a moral order that was altogether alien to their experience. The following passage, an excerpt from a judgment illustrates this point:

Courtesans have no doubt been a recognised institution in India from very early times. It is plain from the rules laid down by the Smritis that unchastity was at the time of their composition a very common and comparatively venial offence. Manu's code indicates the influences under which it was composed by exempting from penalty the virgin who makes advances to a high caste man. The case is contemplated of men who make money by their wives' prostitution. Narada recognises the class of courtesans, and allows intercourse with them as with their slaves who are not kept secluded. He exempts their ornaments from confiscation, as he does the instruments of musicians. [H]arlotry was an occupation of which the Hindu law took cognisance and has been deemed important enough in modern times

to be made the subject of special rules in the Vyavahar Mayuka and Vivada Chintamani'.¹¹

Drawing from various textual and customary sources, the judiciary, over a period of five decades built a broad framework within which devadasi inheritance – the second issue addressed by the courts – could be decided.

Devadasis, according to this framework were Hindus although their exact position in the caste hierarchy was difficult to determine. Male members of this caste as well as married female members were governed by the ordinary Hindu law of inheritance. It was not imperative however that female members of this caste marry. They could remain unmarried, and become professional dasis without risking any degradation or stigma as long as they observed caste customs. Hence, dissolution of the relationship between degraded women and their relations who remained in caste could not be held to apply to members of this caste. But it will be seen at once that [the ordinary Hindu law of inheritance] which is based on a system of legal marriage and consequential relationship, cannot be applied at all or at very least without very considerable modifications to the property of a woman of this caste who except her own children can ordinarily have relations only through females.¹²

If a woman of this community elected to marry her rights to inheritance would be in conformity with the ordinary Hindu law and subject to the disability of the ordinary Hindu woman to take absolute estate. This would also apply to women who married and lapsed into their traditional calling later as regards property they held while they were part of the ordinary Hindu family.¹³ Where the case was one of inheritance by dasi descendants of dasis, judgments were governed by the general principle that daughters inherited as sons in this community.

There were however, important exceptions which could not be decided by analogy. For instance self-acquired property of one member of the undivided Hindu family was not subject to partition according to textual sources. In the case of Chalakonda Alasani it was decided that she, as head of the family was entitled to the possession and control of the property that her daughter by adoption claimed to be her own self-acquired property.¹⁴ The ground for this stand was that the business of the daughter started with the use of the mother's resources and property and hence the mother's claim as the eldest member of the Hindu joint family could not be but upheld. Apart from textual sources European text writers like Strange supported this view when he wrote in his *Manual of Hindu Law* that 'the essence of the exclusive title exists in the acquisition having been

made by the sole agency of the individual, without employing for the purpose what belongs in common to the family'.¹⁵ This was a provision that could be applied to all the devadasis in general because the profession or traditional calling was hereditary and the younger generation was schooled into the profession by the older one.¹⁶

A second departure from the analogous textual tradition was made with reference to the norms of patrilineal inheritance that entitled sons to coparcenary rights in the property of the undivided Hindu family. A coparcenary of dancing girls was constituted only of their rights to survivorship. Daughters did not acquire an interest in ancestral property by birth.¹⁷ This departure was essential in order to bring the question of adoption within the ambit of legitimacy. Further, adoption did not need authentication through a ceremony. A unilateral act of adoption by a woman was legally binding. A daughter thus adopted would inherit her mother's property in preference to the latter's eldest surviving male relation.¹⁸ If this male relation was an illegitimate son he could still not inherit his mother's property because the sapinda or propinquity principle was applicable only to male offspring governed by the Hindu law of succession. The propinquity principle was however applicable when the rights of illegitimate female offspring were at issue – irrespective of whether they were married daughters or dasi daughters.

Defining the marital status of a dasi daughter was problematic. The texts, primarily the Mitakshara made mention of only two classes of daughters – Kanya and Kulastrī. The law for Sadharan Strī might have been applicable to the women if it had been codified. That it was not codified was probably because any woman lapsing into prostitution became a disqualified heir as either a patit (outcaste) or apapitaki (vicious woman) and forfeited absolutely all right of inheritance.¹⁹ Clearly the dancing girl was not a sadharan strī either. It was this very ambiguity about the position of the devadasi that colonial discourse on the inheritance rights of devadasis attempts so hard to resolve. These rights had to be clearly defined and textualised in order to bridge the gap created by the absence of textual sources.

The painstaking attempt to resolve the adoption issue and define as precisely as possible the rights and privileges attached to adoption displays for us yet another area of tension within colonial discourse. As we have seen earlier, the same courts of law pressed charges of prostitution on women who adopted female children attempting thus to assert the primacy of penal law over customary law while simultaneously making every effort to give legal recognition to the

same practice thereby legitimising it and bringing it within the realm of public law

THE CONTESTATION OF COLONIAL INTERVENTIONS WITHIN JUDICIARY

It must be reiterated here that the resolution of contradictions and the legitimating of colonial interventions did not go unchallenged. The privileging of generalisations over the facts of the case and the creation of distinctions which did not previously exist between different groups of people was seriously contested by Indian judges.

To begin with, the unqualified equation of the devadasi with the prostitute caused considerable tension within the judiciary. Through the contesting of interpretations, 'native' judges forced the colonial government to recognise and address its violation of the very principles of jurisprudence on which it built its entire judicial system and to admit its biases. The argument they put forth was that since Hindu law generally recognised adoption as a way of ensuring continuity of the lineage, 'it should therefore not in the case of dancing girls be confounded with prostitution which is neither its essential condition nor necessary consequence but an incident due to social influences'. They further asserted that the devadasi was entitled to civil rights and hence had the right to adopt a daughter if she chose to, and to offer the girl a choice between her mother's profession and marriage when the time came.⁴

In *Queen Empress v Ramanna* (1889) Ramabai, the daughter of parents who belong to the 'Bhopam or dancing class' was given in adoption to an aunt of her father's. This aunt had four years earlier adopted a girl from another community and used her 'for prostitution in her minority. She was charged by the deputy magistrate and convicted of the offence by the sessions judge. In Ramabai's case, however, it was argued that she could not be convicted because the child belonged to the Bhopam caste even prior to adoption. To support this contention the sessions judge interpreted the sections 372 and 373 of the penal code as being directed against a disposal of a minor which takes her from a position where she is not liable to become a prostitute and places her in a position where she is more liable to become a prostitute. '[T]hese sections [do not] apply to adoptions among the dancing women themselves, who do not alter for the worse the status of the child.'⁵

Justice Muttuswami Iyer felt that this argument violated the 'universal principles of jurisprudence'. He argued that the law could not differentiate between minors on the basis of caste. He further contended that Hindu law in general recognised adoption as a way of ensuring the continuance of the

lineage, dancing girls being no exception to this. There are several dimensions to this argument. At one level Muttuswami Iyer was really contesting the authority of the British in forcing problematic interpretations on Indian society. On yet another trajectory, this was a line of argument that asserted the civil rights of prostitutes,⁶ since the earlier argument if allowed to remain uncontested, would also imply that if a girl was born into a prostitute class, she could not redress her grievance in court.

The entire judiciary, however, was consistent in its perception of this institution as an unfortunate and undesirable reality. The disagreement was on the manner and degree of intervention that the judiciary could engage in. Almost without exception English judges were insistent on pressing charges of immorality and moral depravity while Indian judges, more sympathetic to the reality, hoped that '[a]s the mind of the community becomes enlightened its legal convictions will change and this will constitute a change in its common law as that law must from time to time be recognised and recorded in the courts'.⁷

Finally, another area of tension was the interpretation of history. By positing an alternative dravidian perspective of history Justice Devadoss, an Indian judge in the Madras high court, and a non brahmin contested colonial interpretations which were derived from aryan interpretations.

Though the *śrutis* and *śmritis* are applicable only to the Aryans, yet the text writers have extended the law to all the residents of India and the courts have applied the Hindu law to all the races inhabiting this vast country in the absence of proof of any special or local custom. The Dravidians of southern India who are of furman origin had settled in India long before the Aryans entered it. They had their own laws and customs which are prevalent even today. The Aryans when they settled in this part of India (tried to impose their own laws which) were never completely successful. The laws relating to family relations and succession and inheritance laid down by Manu and the commentators like Yajñavalkya and Vignaneswara were never accepted as binding by all the people. It was the East India Company's courts that held for the first time that the laws contained in the ancient *śrutis* and *śmritis* were applicable to all Hindus in southern India in the absence of any custom or customary law governing any class of people. Manu in order to extend the influence of the Aryans compendiously uses the term 'sudras' to the people of this country who are not Aryans in the same way as the Europeans use the word 'native' to all those who are not of European descent, and postulates that they are all sudras who have fallen away from the high place once occupied by them in the Aryan polity. This attempt

on the part of the law-giver Manu to extend the influence of the Aryans among the races who inhabited this land was always pushed in the direction of influencing their religion and rules of succession. In course of time the courts have come to regard Manu and the commentators as authoritative exponents of the law applicable to all the inhabitants of this country who do not profess any distinctive faith like Muhammadanism or Christianity. The customary law was considered as an exception to that contained in the *śrutis* and *śmritis*.⁸

In general, Indian judges qualified their condemnation of the practice by asserting (a) that even prostitutes have civil rights which cannot be infringed by the mere accusation of moral depravity and (b) that although these are undesirable practices, they are linked to and part of the larger history of the region, a history of subjugation of the native dravidian population by invading Aryans and the forcing of alien practices on the native population.

Interestingly and predictably Muttuswami Iyer, a brahmin judge of the Madras High Court, used the civil rights framework, and although the judgments are extremely well delivered and sensitive, they are still bound by the fact of the political polarisation between brahmins and non-brahmins on this issue. Viewed in this context Muttuswami Iyer's position can also be read as an attempt at shielding the institution from judicial scrutiny. On the other hand, Justice Devadoss, an Indian and a non-brahmin, used the dravidian origin framework and set about diligently mapping the terrain on which this debate should be located. While there is undoubtedly an argument on the merits of the case, it is important to reassert at this point the non-existence of neutral positions on this issue.

Although the importance of this dimension to the discourse on devadasi abolition cannot be understated, a more detailed consideration is beyond the scope of the present article. Suffice it to say that the Indian judges themselves were far from a homogeneous group with people of varying castes, communities and political convictions, differences which introduced a further complexity into the issue. At the same time, these contentions were part of a much wider and encompassing critique of colonial interpretations of Hindu society and represented an attempt to retrieve a legitimacy that was now being denied to a culture and a people. While this constant challenging of interpretations took place within colonial institutions and the process of retrieval itself redefined morality and legitimacy in terms of the emerging framework, the manner in which the trend towards monolithic, ahistorical narratives was inverted by Indian judges (though small in number) is a matter of significance. In the

process, the narrow boundaries within which colonial jurisprudence operated were forced to widen in different directions, causing definitions of 'the normal', 'the moral' and the 'marginal' to shift significantly. These are precisely the points where the articulation of the devadasi question in the colonial judicature intersects with the articulation by anti-abolition devadasis of their own position, as we will see later.

In the final analysis, the debate within the judiciary foregrounded most of the concerns of and tensions and contradictions inherent in the discourse on the devadasi institution in the colonial period. Most of these tensions and concerns recur in the debates of the social reform movement in many different ways.

II

Social Reform and the Devadasi Question

Alongside attempts to push for reinterpretation through the colonial judicature, the movement for social reform gained momentum and joined issue with the courts on the devadasi question. While the women's question was embedded at the base of the orientalist discourse and all that followed, it acquired a new dimension at the time of the movement for reform. The moral strength of the community was defined in terms of the sexual morality of its women. As a result of this not only was there a reconstitution and restoration²⁸ of the devadasi, but for the first time the ideal of the 'true Indian womanhood' was being held out to a community of women who were till then, in colonial society, treated as marginal at best. This section examines the intellectual and ideological influences on the movement for devadasi abolition and the character of the movement.

Efforts at reform in Madras presidency began in the 1830s. These efforts however, developed into an organised movement for reform under the leadership of Kandukuri Veeresalingam. In his efforts at reform, Veeresalingam's thrust was primarily towards the rearticulation of the moral question. This rearticulation was directed not only at the issue of sexual relationships and notions of conjugality, but also towards social hygiene – the ideal education, religious practices, corruption in administration, etc.²⁹ Reform movements during this period were focused almost exclusively on women's emancipation. The most important route to emancipation was thought to be education. This occupied the pride of place on the evangelical agenda³⁰ and was soon taken up by Indian reformers, especially Veeresalingam, who started a girls school in Dowaleswaram in 1874. He then started a journal to propagate ideas of reform.³¹

The other issues that reformers of this period took up were infant marriages, 'Kanyasulkam' (bride price), and enforced widowhood. Following this, women's associations ('Stree Samajalu') came up all over the region and boosted Veeresalingam's efforts. Later still, in the early 20th century, 'Ladies Conferences' were organised where women themselves lectured on female education, women in ancient India, the domestic economy, sanitation, etc (*The Hindu*, April 25, 1911). In this climate of reform, the devadasi question was articulated in two clearly identifiable phases, the first originating in the Telugu areas of the presidency and the second in the Tamil areas.

FIRST PHASE OF DEVADASI ABOLITION: MOVEMENT FOR SOCIAL PURITY

'Nautch', as the devadasi system was described by the westerners to begin with, and then by Indian reformers, came to occupy centre-stage in social reform as part of the 'Social Purity' movement. This movement had as its chief objects 'the total abstinence from intoxicating drinks, purity of private life, (and) the abolition of the devadasi system' [Ramakrishna 1983:134].

The protagonist of the movement, Raghupati Venkataratnam Naidu (1862-1939) was born in Machilipatnam and grew up in North India. Throughout his formative years he displayed a keen interest in sufism and a sensitivity to social reform. His views on reform were modelled not just on the views of Bengali philosophers, especially brahmo philosophers (whose writings no doubt exercised a considerable influence on him), but also on western philosophers, especially Carlyle and Emerson. While at Madras in the 1880s he started the movement for social purity [Ramakrishna 1983:136-37].

The timing of the social purity movement is significant. It was around this time that the Purity Crusade in England and America caught momentum and was assuming the dimensions of a mass movement. It is also significant that the 'parent' movement had as its chief objectives the prevention of intemperance in sexual life and with regard to alcohol. Erotic in art and literature was widely condemned. Prostitution hitherto defined as 'sexual intercourse, except for propagation,' was redefined to refer to corruption and moral depravity in life [Pivar 1973:33-34]. While the social purity movement served middle class interests, the values of social purity were internalised among some portions of the working class in the late 19th century. This is a dimension of social reform that is crucial to our understanding of the movement for devadasi abolition. The involvement of the working classes was

part of a conscious effort on the part of the pioneers of social purity, who constituted chastity leagues and organised hundreds ladies of rescue committees. They addressed the need for male chastity in meetings of working class men, who were also recruited in thousands into white cross armies that were dedicated to promoting the single standard of chastity and attacking vice [Walkowitz 1980].

The framework of belief in which these changes came about was located firmly within the mid-19th century notions of absolute social progress. It projected a view of the development of the world's history which compared the social, scientific, and material conditions of the western Christian nations with the Hindu and Muslim societies of India, and pronounced their superior social progress to be the result of belief in Christian truths. The material basis of this view can be found in the stark discrepancies in material successes between India and that part of the west that was presented to India. Take for instance the emergent capacity of western societies to understand and manipulate the material world. The advances of 19th century science were projected as one aspect of Christian religion, as opposed to Hindu astrology and geography that was predicated on divine forces. The political sphere too seemed to present 'objective truths' about the incapacity of Indian society to protect itself against enemies, let alone ensure a stable internal order [O'Hanlon 1985:55-56].

The intellectual and ideological influences on India from the west came from two apparently divergent sets of ideas – one, a missionary statement on Protestant Christianity, and the other a distinct radicalism both in religious and political matters. In practice, however, in the Indian subcontinent they worked together to reinforce one another. Together they helped to produce a breakdown of belief in existing Hindu institutions amongst a highly influential section of western educated Indians.

This was not quite the paradox that it seems at first sight. In attacking superstition and idolatry, the Protestant critique of Hindu society bore a strong structural resemblance to the arguments put forth by European religious radicals against the corruptions of the European Catholic church. O'Hanlon suggests that the similarities between these two trends arose from the strategies that were adopted by the missionaries as the most effective means of undermining Hindu religious beliefs [O'Hanlon 1985:52-53]. That Venkataratnam Naidu adopted most of the ideas of his precursors in the west is obvious not just from the almost identical agendas of both the purity movements but also from his rhetoric. His ideas are constructed in and expressed through

frameworks that bear strong influences of Protestantism [Venkataratnam 1901]

Social purity was for him

chastity in body and chastity in mind stern uncompromising repugnance to whatever is base and vulgar indecent or immodest in study or pleasure speech or song faith or sentiment thought or life stout unrelenting opposition to every habit or custom regulation or institution that defeats or tends to deflect at the high purpose of human life by gilding shame with fashion or condones carnal longing as venial

On the one hand it honours the life that never deviates into guilty pleasure and counts him a hero who always keeps the citadel of his senses. It upholds the law that vindicates morality and espouses the custom that conforms to righteousness. It welcomes the song that softens the savage in man and lives by the faith that adores the All Holy [Venkataratnam 1901 260]

Then there is of course the concern for the purity of the nation (expressed in terms of the Anglican stable that needed to be cleansed). Superstition and blind adherence to custom for Venkataratnam were just outer abasements which once removed would reveal the native grandeur of the nation [Venkataratnam 1901 264]. These premises however could not stand on their own in the context of social reform. They had to find (and did find) support within the native textual traditions. The *Mahabharata* for instance describes the wife as the friend in solitude the father in duty the mother in distress and the refuge in wilderness.¹ This redefinition of conjugality was crucial to the movement for devadasi abolition and enjoyed a dual legitimacy. Believers drew on Hindu texts for authentication while non-believers, primarily activists of the non-brahmin movement in Madras presidency, drew on what they perceived as western notions of conjugality based on love and companionship both apparently opposed but in fact similar in this regard.² The fulfilment of the agenda for purity began with the anti nautch agitation. While secret vice was found to be common the world over, India was the only nation in which immorality was practised as a hereditary and acknowledged profession, living in peace and amity with and amidst other avocations fortified against attacks of time and change and endowed with the privileges of social sanction' [Venkataratnam 1901 272]. Summing up his position on the 'nautch' question, Venkataratnam envisaged two changes which if induced would lead to the healthy moral regeneration of the race. These were the allotment of temple-service for sacred purposes to anyone with a 'proven record of chastity' and secondly, the education and improvement of the male members of the community

who were 'mostly drones or parasites' [Venkataratnam 1901 279]. This way '[a] caste chartered to a vicious life, will cease to be and though some poor sheep may deplorably go astray not a few of the daughters now deliberately prodigal will be restored to the longing bosom of the Divine Mother' [Venkataratnam 1901 279].

The influence of Christian or other western ideas upon social reform is very significant. Most reformers accepted the missionary critique of Hindu institutions without identifying themselves with any specific Christian doctrines to which the critique was tied (O Hanlon 1985 52). Adopting most of the ideas of its precursor in the west social purity in Madras presidency roused the consciousness of people especially students. Between 1881 and 1910 the anti nautch agitation had spread all over the Andhra. Public opinion at the end of the first phase of the abolition movement forced the government to consider the question of nautch reform seriously. On March 3 1911 the Indian government home secretary Butler circulated a letter to the elders of the presidency asking for opinions on the efficacy of sections 372 and 373 IPC in curtailing the devadasi system (*Krishnapatrika* July 7 1911).

In his reply to this letter Narayana Iyer the Madura magistrate said that the devadasis traditionally protected the chastity of married women. But poverty had now forced them into common prostitution. He attributed their poverty to two reasons: first, their not being invited for marriages as a result of reform activity and second the famine of 1876. A pre famine and post famine census of prostitutes he felt would demonstrate his point. The measures he suggested to curb this practice are significant because they are representative of the general tone of reform rhetoric: (1) Prostitutes should be isolated, (2) Their numbers should be monitored by frequent censuses, (3) They should be penalised if they solicit men and (4) There must be a ban on adoption (*Krishnapatrika* May 15 1911).

In March 1914, the Pudukottai Darbar circulated a memorandum requesting members of the representative assembly to offer their opinion on the subject of devadasi abolition. Of the 30 members of the representative assembly, replies were received from 17, of whom eight recommended that the practice be stopped five that it be continued under certain conditions three that the existing practice be continued and one felt that the 'sastras' ought to be consulted. After these deliberations, the Darbar concluded that while it was not yet time to stop devadasi service in temples altogether, it was not necessary for this service to be performed by dedicated girls. It expressed agreement with the judges of the Madras High Court

in construing the dedication of a minor girl as an offence under section 373 IPC, and ordered the dewan peishkar to prohibit the ceremony of Pottukkattal [the 'tali' tying dedication ceremony] in the state. It further issued four orders to safeguard the interests of minors, which said that any woman of the Melakkarar caste, single or married but not widowed, could serve as a dasi in temples provided she was accomplished in the performing arts: no girl under 16 would be appointed as dasi to any vacancy arising after the date of the order already dedicated girls being exceptions to this there was to be a scaling down of dasis in terms of numbers, with vacancies being abolished as and when they occurred and finally temples that had no dasis serving in them would continue without them.³

Clearly during this period there was an increasing consciousness of the problematic nature of devadasi service but the fact of its complexity made it difficult especially for establishments to ban the practice altogether. The first phase of devadasi abolition was therefore characterised by protracted debates on what the practice constituted in essence and what ought to be done to remedy the situation without necessarily transforming it. Although there were activists of this time who did not see a difference between the devadasi practice and prostitution there were also a number of people who recognised the difference. Also notably, the protagonists of reform in the earlier phase were men as were the beneficiaries.⁴

Apart from this the colonial government despite public support was not in a position to take any further conclusive steps towards abolishing the devadasi system. To put it in the words of the law member of the council of state the 'Government would be prepared to assist the house in every way to suppress the evil if it is a matter of fact the dedication of a girl does amount to her employment as a prostitute this is an assumption the government as such is not in a position to make' (*Proceedings of the Council of State* September 1927, p 1137). While the colonial judiciary had since 1861 been attempting unsuccessfully no doubt, to criminalise the devadasi practice by confounding it with prostitution and penalising individual women, it now became necessary for the government to take a stand on the legality of the devadasi practice. This was decidedly more problematic than dealing with the issue from one case to the next, given the history of the colonial government's complicity with brahmin orthodoxy, the rise of the nationalist movement which in the presidency had a predominantly brahmin composition, and the fact that devadasi abolition was an important item on the agenda of the non-brahmin movement. It therefore remained an unresolved issue and legal abolition had

to wait till 1947 for the nationalist government

SECOND PHASE OF DEVADASI ABOLITION

At about the time when the colonial government expressed its inability to outlaw the devadasi system, Muthulakshmi Reddi, a medical doctor and legislator, launched a massive campaign for abolition, urging her sisters who belonged to the community out of their 'life of vice' and instead to fulfil their role as 'loyal wives, loving mothers and useful citizens'.³⁶ In the second phase of the movement in the 1920s Muthulakshmi rapidly became the undisputed leader of the movement for abolition. One finds very strong echoes of Venkataratnam in Muthulakshmi Reddi as well. She too believed in the civilising potential of the west and in the moral superiority of the colonial rulers. In urging them to expedite legislation, she frequently referred to their Christian birth and training and to their Christian ideals and sense of dignity. This belief in the moral superiority of the colonial masters coexisted with a belief in a glorious Hindu past in which the devadasis who served in temples were pure and chaste like the vestal virgins of ancient Greece (*MRP* sf 11). Her aim was to rescue Hindu society from the clutches of blind superstition and obscurantism which she believed could only spell its doom. '[Prostitution] is a question that vitally concerns the dignity and status of every woman in India inasmuch as it is a stigma on the whole womanhood and a blot on Hindu civilisation' (*MRP* sf 11, 3 533-39).

In the second phase of the movement for reform, Muthulakshmi became the only authoritative voice of the movement.³⁷ Her background and professional training contributed in no small measure to her authority. She had had an advanced education (which included specialised medical training in Britain) and had come into political power. She was on par with the political elite in the presidency and the British bureaucracy – both almost entirely male – and with women who were active in the movement for women's emancipation in the west. This clearly set her apart from the devadasis whose cause she was championing. In writing to a white woman friend, she said that they should 'view matters in the light of [their] conscience and in [their] individual sense of right and wrong because fortunately [they were] in a position to instruct and lead people in the path of virtue' (*MRP*, sf 11, 1 131).

How did Muthulakshmi perceive the situation of women? 'We women ought to realise that the degradation of one woman is the degradation of the whole sex. Women alone can protect women's interests' (*MRP*, speeches and writings, Vol 2, part 3,

pp 1067-75). She writes referring to prostitution 'Of all the laws, rules and regulations which for centuries have helped place women in a position of inferiority none has been so powerful in creating in the minds of men and people a sentiment of scorn and contempt for women as the degrading idea of the double standard of morals' (*MRP* Speeches and Writings, Vol 2 Part 3 p 1067-1075). Quoting a passage from the Labour Women's Magazine in London Muthulakshmi Reddi reminded the government of its duties towards protecting people from four great dangers – disease, ignorance, starvation and disorder. She saw no reason why women in India should even be expected to differ from women in progressive countries. Addressing the Seventh Andhra Provincial Women's Conference at Ellore, she demanded compulsory and primary education for children, sanitarium housing for the poor, reform in marriage laws and inheritance rights equal and high moral standards between the sexes and the suppression of immoral traffic in women and children.³⁸

It is important here to recognise the ambivalence in the positions Muthulakshmi assumes. While on the one hand she consciously sets herself apart from the community whose cause she espouses (and in doing this she is in a sense reiterating a distinction that already exists and is based on class and political power), on the other hand the sheer range of issues she raises – some of them radically and explicitly feminist – sets her apart from the class she identifies with and the people and institutions she shares political power with. In seeking to abolish the devadasi system Muthulakshmi Reddi was explicitly following in the footsteps of Josephine Butler, whose campaign against prostitution in England was by her own admission her chief source of inspiration [Butler 1976]. This reform was for Muthulakshmi Reddi only the first step in a much larger endeavour. 'Once the Bill is made into an Act and the sanction of the temple to such a practice is taken away this caste will naturally and spontaneously disappear from our midst. Then we will have to deal with wider question of the international problem of prostitution and protection of young women and children from the indecent attacks of men, which I feel will be an easier task'.³⁹

However, all women were not considered capable of protecting their own interests. In Muthulakshmi's view, for instance, those devadasis who opposed her bill, demanded the right to determine their own future and were unwilling to be transformed by her into 'loyal wives, loving mothers and useful citizens,' were only a 'set of prostitutes who have been set up by their keepers'.⁴⁰ She urged the government 'not to pay heed to such protests from a most objectionable class

of people in society'.⁴¹ This superior self perception and the separation of self from the objects of reform was again not something that was peculiar to Muthulakshmi alone. Rather it seems characteristic of middle and upper class women in the late 19th and early 20th centuries who took up the cause of women's emancipation in the west and India. In the west for instance feminists insisted on their right to defend prostitutes by invoking two kinds of authority relationships – mothers and sisters. The invocation of the mother-daughter relationship, while at one level subversive of the father's control over his daughter in a patriarchal system, was in this context also one that was hierarchical and custodial. Further although they were no doubt capable of articulating a radical critique of prostitution, middle class feminists in the west as well as in India were ambivalent about prostitutes and the right of women from lower classes to control their own sexuality. Walkowitz says that feminists tended to share the same feelings of anxiety over youthful female sexuality as other members of the middle class – for them as for more repressive moralists – the desire to protect young girls thinly masked coercive impulses to control their voluntary sexual responses and to impose a second code on them in keeping with the middle class view of female adolescent dependency' [Walkowitz 1980: 149].

Where Muthulakshmi was concerned it was not the devadasis alone who were incapable of articulating their interests. In a letter to an associate while her bill was being discussed in the legislative council, she says 'I find that none of these women [Muthulakshmi's] are up to date and capable of piloting any Bill. It would have been better if a gentleman had been given the opportunity of introducing the Bill and getting it through'.⁴² For Muthulakshmi the devadasi institution epitomised the 'loss of masculinity and cultural regression of the Hindus' [Chakravarti 1990: 5]. The devadasi system, in her view, was a slur on the Hindu nation. The integrity of the Hindu nation had to be safeguarded against onslaughts from the Christian evangelical efforts to counter the system through proselytisation. Crucial to her defence was the need to account for a practice which was not only so widely prevalent in the contemporary society but also found mention in the religious texts. This involved an exploration into textual origins. These explorations revealed to them that devadasis were originally a band of pure virgin ascetics attached to temples. They were believed to have lived a holy life, wearing only the simplest clothes and subsisting on the food given to them by the temples.⁴³

Generally support for the cause of abolition was mobilised in three ways.

depending on who was being addressed. Since the primary attempt was to wean the women and men away from their community, they constituted the primary target for the abolitionists – a target the abolitionists could afford to be extremely ruthless with. The self-esteem of the men and women was undermined and an abhorrence was created in them of their moral laxity and material dependence. The accusation of immorality was directed against devadasi women. The dasi herself is a recognised prostitute. The result is that a depraved woman who has wrecked many a family and who is a curse to humanity is considered to be entitled to an office in the temple of God and is allowed to tempt God's bhaktas away from the path of morality by her dancing and singing, even at the time they are praying to overcome temptation. "The men of the community on the other hand were exhorted to realise how they have lost their individuality by their abject and servile dependence on their women. They were told that their manhood lay in their self-respect and self-reliance and on their capacity to assume their *rightful place as the economic unit of the family in place of the woman* (emphasis added)." 45

Yet another group being addressed was the Hindu orthodoxy. At the time when the non-brahmin movement was gaining ground in Madras presidency, the colonial government took over the control and administration of temples which were hitherto controlled by zamindars or the landed aristocracy. Whether or not it was intended, this move by the colonial government helped retain brahmin control over Hindu religious institutions. The importance of brahmin support as a result could not be dismissed even in the face of the rapidly spreading non-brahmin movement. In order to woo brahmin support, Hindu scriptures were invoked to show that servants of God were expected to be chaste and pure and that the Hindu religion did not sanction sexual promiscuity.

By the time the movement for abolition reached its peak, colonialism and the developments associated with it had brought about many changes. Of interest here is the substantial alteration that had taken place in the structure and the ideology of the family. A strictly utilitarian sexuality was increasingly becoming the norm in British India. Young boys were exhorted to practice continence as it would lead to the moral regeneration of the race. Our educated young men and women must take the vow of Brahmacharya and take light and knowledge to every poor and ignorant home in the [village]. 46

Further, the debate on abolition was located in British India and the promulgation and execution of laws was the preserve of the

British Propagandists for abolition therefore often felt compelled to express themselves in and to translate reality into language that would be comprehended by the British. The Hindu religion, here represented by the dedication of girls to gods, was alien to the British experience. The first step towards narrowing the gap between the Indian experience and the British one was to use the words 'devadasi' and 'prostitute' interchangeably. This also translated reality into categories that were consistent with the rapidly changing perceptions of Indians themselves. Contemporary polygamous relationships among the devadasis, according to this argument, were aberrations which did not reflect the glory and sacredness of the Hindu nation. This had marginalised or excluded those women who did not come within the very narrowly redefined boundaries of the monogamous family: an adult female had to be either a wife or a prostitute.

RAMAMIRTAMMAL AND NON-BRAHMIN ARTICULATION OF ABOLITION

In the Tamil areas of the presidency most of the abolitionists were in the non-brahmin movement. While they supported Muthulakshmi's demand for abolition, there were very significant departures in the frameworks within which they articulated their demand. Ramamirtammal, a 'reformed devadasi, writer and active abolitionist' was one of the key architects of this lobby. Very briefly, Ramamirtammal held brahminism and the aryan religion responsible for the evil of dedication. She provides an extremely illustrative critique of brahminism. If Brahma is really a great god he should arrange marriages between people of the same age. How can he marry a six-year-old girl to a sixty-year-old man? Even if this is possible why then is it not possible for a sixty-year-old woman to marry a six-year-old boy? Can our women not see that all this is done by brahmins to ensure their livelihood? All these people – dasis, prostitutes, priests and brahmins – need a god who will provide them with a means of livelihood' [Ramamirtammal 1936: 46]. The question she poses 'God is the protector of the world, will he watch silently while his wives prostitute themselves?' is a powerful indictment of not just the nationalist defence of the essential Hinduism but also of the pro-Hindu biases of prominent abolitionists [Ramamirtammal 1936: 58].

Ramamirtammal used the devadasi practice as a pivotal point in her critique of brahminical Hinduism. In this view religion and god (both terms by implication aryan and brahmin) created caste differences, untouchability, enforced widowhood and prostitution that was practised under the guise of euphemism. The devadasis, she

said, were mere instruments of brahmin treachery. Brahmins were seen as conspiring to ensure the continuance of their oppressive hegemony by perpetuating disgraceful customs like these. 47

The devadasi institution for the group Ramamirtammal represented, was predicated on Hindu religion and the traditional Hindu family. According to this interpretation, the tensions within the family between the women and their mothers and sisters-in-law and the mandatory distance and reserve between husband and wife in a traditional marriage forced the husband into easier and more relaxed relationships with dasis. The solution to the dasi question would be reached, she felt, if the structure of marriage was loosened to accommodate a greater ease in conjugal relationships. The new ideal of marriage was based on the redefinition of 'Ideal Womanhood'. Brahminical ideals of the unquestioning, self-effacing, obedient wife were clearly inadequate and even detrimental to the interests of women [Ramamirtammal 1936].

THE MOVEMENT AGAINST DEVADASI ABOLITION

There were many devadasis who opposed abolition. They formed groups to oppose the proposed bill tabled by Muthulakshmi Reddi in the legislative assembly. For example, in 1927 the anti-abolition Devadasi Sangam of Periyakanchipuram had 28 members, that of Chinnakanchivaram had 50, that of Tirukkalkunram had 100, and the one in Chinglepet had 25 members (Press Clippings, *MRP*, sf 12).

The devadasis of the Seyyur Kandaswamy temple, Vanmeeghanadha temple and Needamanikkaswami temple in Chinglepet district formed an association in 1927 of which Saradammal and Doraisammammal were unanimously elected president and secretary, respectively. The resolutions passed at the first meeting of this association condemned the proposed bill tabled by Muthulakshmi Reddi, and defended the devadasi practice as part of a noble ancient religion and appealed to the government not to wipe it out through the enforcement of law. The meeting also condemned speeches and writings that equated the lives of honourable people with prostitution (Press Clippings, *MRP*, sf 12). Yet another meeting of devadasis against abolition was held at the house of Maragattammal in Chinna Kanchivaram. Krishnaveniammal presided over this meeting which was attended by approximately 50 men and women. Krishnaveniammal and Kannammal were unanimously elected president and secretary, respectively, and 30 people were registered as members of the association. The unanimously passed resolutions of this meeting vehemently

condemned Muthulakshmi's bill and appealed to the humanitarian government that the practice of 'Pottukkattal bears no connection with prostitution. The resolutions of this meeting were then released in the newspapers (Press Clippings, November 13, 1927, *MRP*, sf 12).

Twenty eight devadasis of Periyakanchi varam formed a Sangam and sent the following appeal to the law member of the Madras legislative council 'We condemn Dr Muthulakshmi Reddi's Bill. There is no connection between our ancient and noble practice of Pottukkattal and the disgraceful profession of prostitution. We appeal to the government not to enforce any law that destroys our rights. These were women who served in different temples and devasthanams in Periyakanchi varam (Press Clippings, *MRP*, sf 12).

Ramamaniammal presided over a meeting of devadasis of the Vedagirisvaraswami koil Devasthanam in Tirukkalkunram which was attended by over a hundred people. Ramamaniammal, Manickathammal, Tirupurammal, Valliammal and Balammal among others spoke about the need of Sangams that would work towards the progress of and unity among devadasis. Specifically with reference to Muthulakshmi Reddi's bill in the Madras legislative assembly. The bill and its implications were discussed at length at this meeting. Thereafter a sangam was formed with 80 people being registered as members. A resolution condemning Muthulakshmi's bill was passed at this meeting (Press Clipping, *MRP*, sf 12). The Madras Presidency Devadasi Association was a prominent anti abolition group. Doraikannammal, the secretary, was elected with the specific responsibility of organising her caste sisters through the Devadasi Association with the purpose of defeating the Devadasi Dedication Bill (*The Hindu*, July 14, 1928).

Doraikannammal, Bangalore Nagarathnammal and others met the law minister C. P. Ramaswami, in November 1927 in an attempt to impress upon him the fact that contrary to Muthulakshmi's assertions, there was no connection between the performance of religious services in the temple and prostitution. If the object of the Bill was in fact to stop prostitution, Muthulakshmi ought to find other ways of doing it, they said. In response to their representation, C. P. Ramaswami assured them that the matter would be thought over carefully and assured them that there will be measures to compensate for the loss of property rights in the event of abolition (Press Clippings, *MRP*, sf 12).

At yet another meeting in Georgetown on November 27, 1927, in which both Nagarathnammal and Doraikannammal participated, the question of equating the devadasi practice to prostitution was

debated at length. This meeting was attended by over a 150 devadasis and 25 prominent men of different castes. This meeting passed resolutions condemning the concerted attempts among some sections to discredit a group of women who lived their lives according to a widely respected religious tradition. It also condemned the demand to ban pottukkattal as a remedy for prostitution (*Swadeshamitran*, November 30, 1927).

Doraikannu in yet another pamphlet expressed her unhappiness at the attempt by Muthulakshmi Reddi and her followers to target one group and open it up for public scrutiny. She felt that instead of looking at social evils and thinking of effective ways of stemming prostitution, a blind judicial system was being put into the service of men of the Isai Vellalar community who had a vested interest in dispossessing and discrediting the devadasis (*MRP*, sf 12).

Bangalore Nagarathnammal also a prominent anti abolitionist was a very respected literary figure and artist in her time. She was actively involved in publishing the work of Muddupalani, a reputed courtesan and poet in the Tanjavur Court between 1739 and 1763.⁴⁸ In response to Muthulakshmi's plea for illegalising pottukkattal, Nagarathnammal felt that while prostitution was indeed a serious problem that had to be addressed and while it was true that some devadasis did take to prostitution, removing the pottukkattal ceremony would not affect prostitution in any way. She felt that the link that was being made between the two was far too simplistic. Further, if the argument of the abolitionists was that pottukkattal was a disguise for prostitution, then removing it would only mean opening the field to the unhindered and undisguised practice of prostitution, not to its disappearance. Finally, Nagarathnammal was of the opinion that the devadasi institution was being evaluated by the abolitionists from the standpoint of western religion and social practice. It was necessary instead to locate it within its own parameters and then articulate demands for reform (*Swadeshamitran*, November 30, 1927).

The Madras Rudrakannikai Sangam was an active anti abolition body, issued statement saying 'the people who propose the Bill offer the lame excuse that Isai Vellalar themselves support it. But Isai Vellalar are men born of Rudrakannikais. It is strange that they are supporting the Bill. We will soon see that selfishness prompts them to support the Bill. The women of this class have the sole right to property and the right to funeral honours. It is a fact that in this world men have always had a selfish motive. The men of this class wanted to have the right to property and therefore they bite the

hand that feeds them'.⁴⁹ And from the same group: 'A bill to abolish prostitution ought to exert control over and punish the men responsible'.⁵⁰

Another anti abolitionist says: 'Some members of the Madras Legislative Council, especially Muthulakshmiammal and some Congress leaders, have been employing propaganda work under the misapprehension that the morality of Hindu society would be improved thereby. Not only social conditions can be founded on morality and justice. Without morality, social decency is impossible'.

It is interesting that the pottukkattal was also propagating single and child marriage. The difference in articulation between the anti abolitionists did not come only as or sexual conduct is the key issue. For them, the question of identity and the articulation of rights tied to that identity were critical. However, it was precisely this overblown articulation that in a sense discredited the anti abolition position and made it impossible for the anti abolitionists to sustain their position. Inevitably, an important part of the devadasis' defence was their attempt to portray themselves in a role that was both sanctioned by religious custom and acceptable to the changing ideology. The sanctity of marriage became a central issue. As soon as a woman who is born into that caste takes *trupottu* then she acquires the name *tevaraval*. Just as a married woman belongs to her husband, so also the *kannikai* belongs to Isai Vellalar and her *trupottu* symbolises this.

At one level we could therefore understand the devadasis' defence of their profession as a reverse discourse, which is in the case of homosexuality in the west, the devadasi way of life began to peak for itself to demand that its legitimacy be recognised and acknowledged often in the same vocabulary using the same categories by which it was being increasingly denounced and denigrated (J. Oncourt 1980: 101). But this is only a part of the explanation. At another level, the articulations that got co-opted into the brahmin framework were those of women who were articulating their position outside it. The polarisation of political and the particular configurations of political alliances that seemed possible at that time, equated modernity and political radicalism (especially that of the non brahmin movement) with the abolitionist position and reduced anti abolitionist articulations to a backward traditionalism that hindered progress. This dichotomisation of positions on the part of the reformers invisibilised a discourse that could not be contained in simple dichotomies. The positions that the anti abolitionists like Nagarathnammal and Doraikannammal for instance took, were certainly not brahmin positions nor can they by any stretch be called a set of prostitutes set up by their keepers. To quote

Muthulakshmi "Their own radicalism and sensitivity to issues is comparable to the radicalism of the non brahmin movement but they were located outside it and in opposition to it. It was the impossibility of fixing the anti abolitionists firmly within any of the existing political ideological frameworks that wiped out their resistance."

III Conclusion

The agendas of reform the non brahmin movement the colonial judiciary and first wave feminism intersected to produce a hegemonic ideal of monogamous conjugality that would replace and recast the extended sexuality of the pre colonial family in South India. The pro abolitionists defined the system largely in terms of the evangelical bourgeois feminist and emerging nationalist frameworks of a new moral order - an order whose patriarchal constraints were very different from and alien to the patriarchal constraints that up to that point defined the choices available to female temple servants - and then attempted to find the system they were describing and its participants.

The anti abolitionist devadasis on the other hand strongly resisted the interpretation of pottukkattal as prostitution. Those who were opposed to reform and asserted their right to continue living their lives in the old way were also actively redefining their own positions and attempting to fashion and assert a space for themselves within the emergent moral order - a space guarded against appropriation (by the state reformers and men of their own community alike) - a space that if retrieved would also be legitimate within the new order.

The devadasis who were willing to be co-opted into the revivalist scheme and those who were willing to organise themselves for reform get transformed from passive subjects mobilised by charismatic leaders into people who recognised changes in their life situation and acted to shape their future and retrieve themselves. In this scheme while the pioneers of reform saw themselves as initiating change - for most of the participants it served as a platform that provided visibility - official recognition and 'legitimacy' to changes that were inevitable within the emerging system.

Viewed from this angle we begin to see the victims and their marginalisation in new light. At one level they cease to appear as a homogeneous group. At another level however, the anti abolitionists' position intersected with that of the pro abolitionists in that both accepted the emerging ideal of monogamous conjugality and were attempting through different trajectories, to situate themselves within that ideal.

Notes

[This paper is based on my doctoral dissertation Temple Women in South India: A Study in Political Economy and Social History, Jawaharlal Nehru University 1992. This paper has been substantially revised based on comments and suggestions from the editorial group of the journal *South Indian Studies*. I am grateful to M S S Pandian for his co-operation in agreeing to let it be published in *FPW* instead. A special word of thanks to the referee of *South Indian Studies* who provided painstaking comments on earlier drafts.]

- 1 I am grateful to the referee of *South Indian Studies* for drawing my attention to this judgment.
- 2 Naikins, nautch girls and devadasis are used interchangeably in the first section of this article since the discourse of the colonial judiciary, which the section deals with, does not maintain the distinctions. Precedents are cited across these categories, thus ironing out the differences between them. While I maintain the distinctions and recognise their significance, it is necessary at this point for me to examine the cases as a body.
